Foreword

Greetings,

Military Intelligence acquisition is the ability to identify an information need, prioritize the acquisition time table, identify source points for that information and use various methods to reduce the obscurity of ambiguous perceptions. This structured process will allow individuals to understand and arrive at a correct correlation based upon the available information.

It is imperative to clearly define the purpose of pursuing information, what type of information is to be sought and the sources for obtaining that information. This conceptualization will allow the most relevant information to be collected and an accurate reflection of the analytical process used to derive a precise answer for the desired questions that have been asked.

Information and data all have a story to tell, so the intelligence specialist must have the ability to understand the relevance of collected information and data in answering the questions being posed.

This work was inspired by the artist Madis and their track - Desert Of Lost Souls.

It is my sincere hope that the reader finds this publication useful.

Scenic Television is an Internet television station that presents the sights and sounds of nature 24 hours a day. Let us soothe and relax you wherever you are. Savor the tropical beaches of Puerto Rico or relax at a rain forest in Costa Rica. Meditate at the Danube River in Germany, or relish the view of Lake Zurich in Switzerland. We have scenic videos from locations all over the world.

Scenic Television originates from the Gulf coast of the United States and broadcasts to a global audience. The television broadcast is accessible on any device with an Internet connection. Such electronic devices include desktop computers, laptops, tablets, smartphones, game platforms, and Internet-connected televisions.

DEPARTMENT OF THE NAVY
Headquarters United States Marine Corps
Washington, D.C. 20380-1775

7 June 1997

FOREWORD

Marine Corps Doctrinal Publication (MCDP) 2, *Intelligence*, describes the theory and philosophy of intelligence as practiced by the United States Marine Corps. It provides Marines a conceptual framework for understanding and conducting effective intelligence activities. The Marine Corps' view of intelligence is based on our common understanding of the nature of war and on our warfighting philosophy as described in MCDP 1, *Warfighting*.

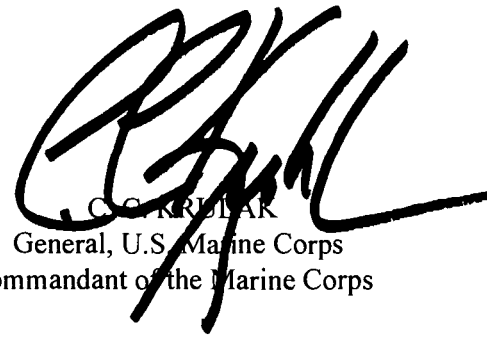
Intelligence discusses the effective use of knowledge about the enemy and the environment in support of military decisionmaking. *Intelligence* acknowledges that uncertainty pervades the battlefield and that our best intelligence efforts can only reduce, not eliminate, uncertainty.

One of the main aims of this manual is to put intelligence into its proper context in relation to other activities of warfighting. The Marine Corps views intelligence as a fundamental component of command and control that is inseparable from operations. The general concepts which apply to effective command and control apply equally to intelligence. This publication, therefore, presumes familiarity with MCDP 6, *Command and Control*, which establishes fundamental doctrine for command and control.

MCDP 2, *Intelligence*, does not supersede any current doctrinal publication. It provides the authoritative basis for the subsequent development of intelligence doctrine, education, training, equipment, procedures, and organization. *Intelligence* affords no specific techniques or procedures for intelligence activities; rather, it offers broad guidance which requires judgment in its application. Other publications in the intelligence series of Marine Corps warfighting publications provide specific tactics, techniques, and procedures.

Marine Corps intelligence doctrine applies across the full spectrum of conflict, from peacekeeping or humanitarian assistance operations on the one hand to general war on the

other. Furthermore, this publication pertains equally to small-unit leaders and senior commanders. Since intelligence is an essential component of any military activity, this manual is meant to guide Marines at all levels of command in both the operating forces and the supporting establishment.



C. C. KRULAK
General, U.S. Marine Corps
Commandant of the Marine Corps

The Challenge to Intelligence—Intelligence Is a Command Responsibility—The Command-Intelligence Connection—The Intelligence-Operations Connection—

Intelligence as a Team Effort—Intelligence Is a Product, Not a Provision—A Balanced Approach—Focusing the Intelligence Effort—Generating Tempo Through Intelligence—Intelligence Education and Training—A Case Study: Somalia 1992–1993—Conclusion

Notes

Chapter 1

The Nature of Intelligence

"And therefore I say: Know the enemy, know yourself; your victory will never be endangered. Know the ground, know the weather; your victory will then be total."[1]

—Sun Tzu, *The Art of War*

"For the whole reason-for-being of all military intelligence personnel is to facilitate accomplishment of the mission, and to save lives. When they fail, all the wrong people are hurt."[2]

—Stedman Chandler and Robert W. Robb,
Front-Line Intelligence

To develop effective intelligence, we must first understand its fundamental nature—its purpose and characteristics as well as its relationship to command and operations. This understanding will become the basis for developing a theory and practical philosophy for intelligence.

HOW IMPORTANT IS INTELLIGENCE?

Maneuver warfare requires a firm focus on the enemy. It aims at taking action which avoids enemy strengths and exploits enemy critical vulnerabilities. The identification of these strengths and vulnerabilities is crucial. Maneuver warfare requires acting in a manner to deceive and then striking at a time and place which the enemy does not expect and for which he is not prepared. Identification of an adversary's expectations and preparations is also important. Maneuver warfare requires decision and action based on situational awareness—a keen understanding of the essential factors which make each condition unique—rather than on preconceived schemes or techniques. How is this situational awareness gained?

Accurate and timely intelligence—knowledge of the enemy and the surrounding environment—is a prerequisite for success in war. Certainly, maneuver warfare places a heavy

emphasis on the judgment of leaders at all levels. Nonetheless, judgment, even genius, cannot substitute for good intelligence. Genius may make better sense of available information, and it may provide superior and faster use of the knowledge it gains from that information, but no commander—no matter how brilliant—can operate effectively without good intelligence. A brilliant commander, Field Marshal Erwin Rommel, proclaimed that, "It is not that one general is more brilliant or experienced than the other; it is a question of which general has a better appreciation of the battlefield."[3]

Intelligence, therefore, is at once inseparable from both command and operations. Intelligence contributes to the exercise of effective command during military operations and helps ensure the successful conduct of those operations. By identifying enemy weaknesses susceptible to attack, intelligence also serves as an important element of combat power.

Effective intelligence in the hands of capable commanders has often provided decisive advantages of tactical, operational, and strategic importance. The Battle of Midway in June 1942 was won by a vastly outgunned and outnumbered American fleet because its commanders had received, recognized, and acted upon detailed and accurate intelligence. In 1986, during air strikes conducted in response to Libya's terrorist activity, intelligence provided the detailed understanding of the Libyan air defense system that enabled Marine and Navy aviators to effectively shut it down. Intelligence's identification of critical vulnerabilities in Iraqi air and ground

defenses contributed to the rapid and thorough defeat of Iraqi forces during Operation Desert Storm.

THE OBJECTIVES OF INTELLIGENCE

Understanding the relationship between intelligence and command and control is key to understanding the role of intelligence. Command and control is about making and executing decisions. The main purpose of intelligence is to support the decisionmaking process.

Intelligence strives to accomplish two objectives. First, it *provides accurate, timely, and relevant knowledge about the enemy (or potential enemy) and the surrounding environment.* In other words, the primary objective of intelligence is to support decisionmaking by reducing uncertainty about the hostile situation to a reasonable level—recognizing, of course, that the fog of war renders anything close to absolute certainty impossible.

In achieving its primary objective, intelligence performs four related tasks. First, it identifies and evaluates existing conditions and enemy capabilities. Second, based upon those existing conditions and capabilities, it estimates possible enemy courses of action, providing insight into possible future actions. Third, it aids in identifying friendly vulnerabilities

the enemy may exploit. Finally, intelligence assists in the development and evaluation of friendly courses of action based on the results of the first three tasks.

The second intelligence objective is that it *assists in protecting friendly forces through counterintelligence*. Counterintelligence includes both active and passive measures intended to deny the enemy valuable information about the friendly situation. Counterintelligence also includes activities related to countering hostile espionage, subversion, and terrorism. Counterintelligence directly supports force protection operations by helping the commander deny intelligence to the enemy and plan appropriate security measures.

The two intelligence objectives demonstrate that intelligence possesses both positive—or exploitative—and protective elements. It uncovers conditions which can be exploited and simultaneously provides warning of enemy actions. Intelligence thus provides the basis for our own actions, both offensive and defensive.

INTELLIGENCE AS KNOWLEDGE

Although the objectives of intelligence have been discussed, the term *intelligence* has not been defined. Very simply, intelligence is knowledge—knowledge about the enemy or the

surrounding environment[4] needed to support decisionmaking. Since people understand situations best as images—mental pictures—intelligence aims to create an accurate or meaningful image of the situation confronting a commander. Good intelligence paints a picture—or more accurately, several pictures—of possible realities.[5]

Not all knowledge which goes into military decisionmaking qualifies as intelligence. Knowledge pertaining directly to the friendly situation or to the status of an ally does not constitute intelligence. Knowledge not pertaining directly to the friendly cause generally falls under the category of intelligence.

What do we mean by knowledge? In describing intelligence as knowledge, we are distinguishing intelligence from data or information.[6] Intelligence is developed from information, but it is important to recognize that *intelligence is not simply another term for information.* Information is unevaluated material of any kind—enemy prisoner of war interrogation reports, radio intercepts, reconnaissance reports, photographs—and represents the raw material from which intelligence is ultimately derived. Few pieces of information speak conclusively for themselves. They must be combined and compared with other pieces of information, analyzed, evaluated, and, finally, given meaning. Good intelligence does not simply repeat the information which a source reveals. Rather, it develops this raw material in order to tell us

what that information means and identifies the implications for decisionmaking. In other words, *intelligence is the analysis and synthesis of information into knowledge.* The end result is not more information, but knowledge that gives us a meaningful assessment of the situation.[7]

Since intelligence is derived from information, it shares many attributes of information. Information, and the intelligence which results from it, is perishable. Information will always be incomplete, sometimes confusing, and often contradictory. Not all information will be important or even relevant, and much of it may be inaccurate or misleading. Too much information can be as harmful as too little. With all information, we seek not a large amount, but to have the right information available when needed and in a useful form, and so it is with intelligence.

Finally, we note that knowledge does not exist for its own sake, but as the basis for action. We do not develop lengthy intelligence studies just because we have the ability to do so or because a subject is of academic interest. Intelligence that is not acted upon or that does not provide the potential for future action is useless.[8]

INTELLIGENCE AS A PROCESS

Intelligence should be thought of as not just a product—knowledge—but also the *process* which produces that knowledge. Intelligence is the process which identifies and evaluates existing conditions and capabilities, estimates possible enemy courses of action based upon these conditions and capabilities, and assists in the development and evaluation of friendly courses of action—all in support of the commander's decisionmaking.

Intelligence is thus a central component of the command and control process, which can be described by a simple model known as the observation-orientation-decision-action (OODA) loop. Intelligence activities make up a significant portion of the observation-orientation phases of the OODA loop with the primary purpose of supporting the decision phase. Intelligence also supports the action phase by identifying targets for attack and by assessing results, bringing the OODA loop full circle to the next observation phase in support of a subsequent decision.

Intelligence must not be construed as the exclusive province of intelligence specialists. Intelligence activities are driven by the need to answer questions crucial to the planning and execution of operations. Intelligence is inseparable from operations. Data collected during the course of operations is essential to the development of a timely and accurate intelligence picture. Above all, intelligence shapes (some would say drives) the decisions made during the conduct of operations. *All Marines involved in operations are involved in intelligence in one way or another, and all Marines involved in intelligence are involved in operations.*

WHY THE MYSTERY?

In the past, there has been a perception that intelligence is a highly specialized field shrouded in secrecy and isolated from other warfighting areas. Many misconceptions concerning intelligence have arisen; some even view it as the modern equivalent of wizardry. Why has this aura of mystery developed?

First, intelligence is usually much less concrete than knowledge of the friendly situation, which Marines are likely to know with much more certainty and detail. It is commonly understood that effective intelligence is an important factor—often *the* critical factor—in mission success or failure.

Isolating or measuring the specific effects of intelligence on the mission's outcome, however, is often difficult.

Second, intelligence employs specialized techniques to develop studies and products. Intelligence personnel receive certain specialized training—but hardly more than specialists in other fields. In the normal course of performing their mission, Marine intelligence sections request and receive support from specialized, technical, and sometimes highly compartmented national, theater, or service-level intelligence agencies. While these activities provide access to resources necessary to develop tactical intelligence, the activities themselves may be of limited interest to combat units. In addition, intelligence often involves highly specialized technology, especially in the collection of information.

Finally, to protect the value of a piece of intelligence as well the sources used in developing it, many intelligence products and methods are classified. Out of the legitimate concern for security, a need to know is a basic requirement for access to intelligence products. In order to protect the sensitive nature of some intelligence activities, elements of the intelligence section may be physically separated from other staff sections, with access to these elements being controlled. Unfortunately, the rightful concern over security contributes more to the mystification of intelligence than any other single factor.

The result is a veil of mystery that often surrounds intelligence activities. However, intelligence is not an obscure activity unrelated to other warfighting activities. In fact, intelligence is a central component of command and control, a fundamental responsibility of command, and inseparable from operations. All personnel involved in the conduct and support of operations—commanders, operations officers, logisticians, communicators, etc.—must understand intelligence just as intelligence personnel must comprehend the conduct and support of operations.

There is nothing mysterious about intelligence. While intelligence collection and production may involve the use of high-technology sensors and networks, good intelligence is primarily the result of solid headwork and legwork, not the output of some secret process or compartmented database. Good intelligence begins with commanders clearly identifying their intelligence concerns and needs. It is developed through the focused collection of information, thorough study, and, most importantly, effective analysis and synthesis. The result is an intelligence product that provides knowledge, reduces uncertainty, and supports effective decisionmaking.

WHAT MAKES INTELLIGENCE DIFFERENT?

We have noted that while intelligence uses specialized capabilities and techniques, this alone does not distinguish

intelligence from other command and control functions. What makes intelligence unique? The one feature which distinguishes intelligence from the other command and control functions is that *intelligence deals directly with an independent, hostile will personified by the enemy.* As such, intelligence deals with more unknowns and has less control over its environment than any other aspect of command and control.

A commander may well face unknowns about the friendly situation—uncertainty about the location, activity, or status of friendly forces. Presumably such uncertainty is not the result of a conscious effort on the part of those forces to deny that information to the commander. If commanders have questions about the friendly situation, they can usually obtain the answers directly from the principals involved. In other words, for nearly every question about the friendly situation, there is a reliable source ready to provide an answer.

This is not the case for questions concerning the enemy or the area of operations. Such information by its very nature will be significantly more difficult to obtain. The enemy will do his utmost to deny us knowledge of his capabilities, dispositions, methods, and intentions through the use of security measures and his own counterintelligence. He may intentionally present us with erroneous or ambiguous information. When a foe suspects that we know something significant about his situation, he will likely undertake actions to change that situation.

This is especially true at the tactical level of war. The closer a unit is to contact with the enemy, the greater attention it pays to security, camouflage, dispersion, and deception. Moreover, once execution begins, the rapidity of changes in the tactical situation combines with the friction and fog of war to make it increasingly difficult to develop a coherent image of the enemy situation. This is why it often seems that we have better intelligence about what is happening in the enemy's rear echelon or capital city than we have about what is occurring beyond the next hill.

We have to work much harder to obtain information and knowledge about the enemy than we do concerning the friendly situation. Despite our extensive specialized capabilities designed to collect information about the enemy, the information we collect will normally be less than what we would like to have. Furthermore, collecting information does not by itself provide the needed intelligence. Even when friendly forces are obtaining information directly from the enemy—intercepting enemy signals, interrogating prisoners of war, translating captured documents—we must still confirm, evaluate, interpret, and analyze that information. Follow-on collection, processing, and production activities are normally needed. Finally, it should be emphasized that our need for intelligence usually greatly exceeds our ability to produce it; while questions about the hostile situation are almost infinite, the intelligence resources available to answer those questions are limited.

Once we have obtained the information necessary to build a picture of the enemy situation, we are confronted with other challenges. First, we must properly interpret the information. More important than the volume of information is the value of the information and the abilities of the people interpreting it. Any single item or any collection of information may be interpreted in a number of ways. Many mistakes in intelligence are not the result of a failure to collect the correct information, but rather a failure to discern the correct meaning from the information collected.

Second, even if we can develop a good understanding of the current situation, we cannot know with certainty what will happen in the future. While we can often assess the enemy's capabilities, we can rarely be certain of his intentions. Capabilities are based ultimately on factual conditions, while intentions exist only in the mind of the enemy—assuming the enemy even knows clearly what he wants to do. Thus, any assessment of enemy intentions is ultimately an estimate. While good intelligence can identify the possibilities and probabilities, there will always be an element of uncertainty in these estimates.

Third, because we are dealing directly with a hostile will, we can never be sure we are not being actively deceived. Even if we should gain some type of access to his actual plans, we cannot be certain that the enemy does not want us to see those plans as part of a deliberate deception effort.

Finally, the problems facing intelligence are further complicated by the irony that good intelligence may actually invalidate itself. Consider the following instance. Intelligence estimates that the enemy is preparing to launch an attack in a certain sector. Acting quickly on this intelligence, the commander strengthens that sector. The enemy, however, detects our enhanced defensive preparations, which causes him to cancel the attack. As a result, the intelligence estimate which predicted the attack in the first place appears wrong—but only because it was initially correct. Intelligence is thus a highly imprecise activity at best, and its effects are extremely difficult, if not impossible, to isolate.

For example, consider the U.S. response to a movement of Iraqi troops toward the Kuwaiti border in October 1994. After a period of increasing tension between Iraq and the United Nations over continuing sanctions against Iraq, U.S. intelligence detected the deployment of almost 80,000 troops in the vicinity of the Kuwaiti border, including two elite Republican Guard divisions.[9] The situation appeared similar to the one in August 1990 when Iraq invaded Kuwait. Intelligence warned that another invasion was possible. The United States and other allies responded by immediately dispatching forces to the region. The Iraqi forces were withdrawn, and the threat subsided. Did Saddam Hussein intend to invade Kuwait again? We will probably never know; intentions can seldom be determined with absolute certainty. On the one hand, we could state that intelligence failed because we could not ascertain Hussein's exact intentions and thus were unable to

detect the difference between a provocation and an actual invasion. A more reasonable explanation, however, is that intelligence stimulated appropriate action, action which prevented an invasion. The warning appeared to be incorrect, but only because it was right in the first place.

EXPECTATIONS OF INTELLIGENCE

We expect a great deal from intelligence. We ask intelligence to describe in detail places we have never seen, to identify customs and attitudes of societies fundamentally different from our own, to assess the capabilities of unique and unfamiliar military or paramilitary forces, and to forecast how these societies and forces will act in the future. Most notably, we want intelligence to enter the thought process of an enemy commander and predict, with certainty, what course of action he intends to pursue, possibly even before he knows himself what he is going to do. The standard against which we measure intelligence is also high. We desire a depth and degree of accuracy in our intelligence which approaches perfection. Even when a reasonable response has been provided to almost every intelligence requirement, there is still one more question to be answered, one more detail to be fleshed out, one more estimate to be refined. This is as it should be. The price for failure in intelligence is high. Inadequacies in intelligence

can lead directly to loss of life, destruction of equipment and facilities, failure of a mission, or even defeat.

When properly focused and given adequate time and resources, our intelligence can come close to meeting these standards. We can provide comprehensive depictions of physical terrain and manmade structures or facilities. Our reconnaissance and surveillance systems can detect and track the movements of ships, aircraft, and ground formations, in certain instances even providing real-time images of enemy activity. Our signals and human intelligence capabilities, coupled with expert analysis, can provide insight into both enemy capabilities and intentions.

However, even in the best of circumstances, intelligence still operates in an environment characterized by uncertainty. Uncertainty is a fundamental attribute of war. As discussed in the previous section, intelligence deals directly with the independent, hostile will of the enemy. This makes intelligence more susceptible to uncertainty than any other command and control function. In practical terms, this means that there are very definite limits to what commanders can reasonably expect from intelligence. Not only will more gaps exist in what we know about the enemy than in what we know about our own situation, but the reliability of everything we do know will be subject to greater scrutiny and doubt. Even if we obtain the correct information, there is no guarantee that we will interpret it correctly or that it will not change. We may be the victims of deception, whether it is by a deliberate enemy

effort or by our own preconceptions. Intelligence produces estimates rather than certainties; it is important to remember that "estimating is what you do when you do not know."[10]

Intelligence may be incorrect sometimes and incomplete at other times, and it often lacks the desired degree of detail and reliability. Some of the questions asked are simply beyond knowing—or are beyond knowing given the time and resources available. Gaps in our knowledge of the enemy situation, sometimes sizable, are a natural and unavoidable characteristic of fighting an enemy having an independent, hostile will. We must continually remember that *intelligence can reduce but never eliminate the uncertainty that is an inherent feature of war.*

INTELLIGENCE IN THE INFORMATION AGE

As a result of the ongoing information revolution, more people have access to more information more quickly than ever before. Intelligence has benefited greatly from improvements in information gathering, processing, and dissemination. Sophisticated sensors clandestinely collect vast quantities of data in all regions of the world. Integrated databases allow us to store and rapidly retrieve virtually unlimited numbers of reports, images, and studies. Information processors assist us

in analyzing the data and developing tailored, graphic-enhanced products that convey intelligence in a more meaningful form. Communications systems give us the ability to share databases, exchange intelligence, and disseminate products almost instantaneously on a worldwide basis.

While it is alluring to believe that the information revolution will solve the problems of uncertainty in dealing with the enemy, technology has its shortcomings as well. Systems employed in intelligence can be expensive and complex. Many are controlled at the national or theater levels, where priorities might not be consistent with those of the tactical commanders. Despite their sophistication, these systems are still subject to failure as a result of weather conditions, breakdowns, or enemy countermeasures.

Further, these systems generally provide and manipulate data and information rather than generate knowledge or understanding. The information revolution has created the very real danger of information overload—more available information than can be readily used or understood. Humans have a limited capacity to assimilate information. Even if we are able to collect vast amounts of information, *information alone does not equate to knowledge or understanding*, which are ultimately the product of human cognition and judgment. Since very few pieces of information are decisive by themselves, they must be interpreted and given meaning.

Finally, the seemingly unlimited availability of information does not necessarily help us in determining which information we should collect and develop into intelligence. In an unstable international environment, in which unanticipated crises proliferate, it is difficult to identify the next enemy or potential enemy. This complicates commanders' problems of identifying their concerns and priorities; it may be harder than in the past to focus the intelligence effort. As a result, it may not be possible to develop adequate basic intelligence about potential enemies or regions well in advance.

We must continue to pursue advances offered by technology to enhance our intelligence capabilities. At the same time, we recognize that technology by itself does not produce effective intelligence. Improvements in data collection, information processing, and dissemination are tools which assist in the intelligence effort. These tools increase our capabilities only when they are applied by knowledgeable and skilled Marines focused on producing timely, useful, and relevant intelligence.

A CASE STUDY: DESERT STORM 1990–1991

The development and use of intelligence in support of Marine operations during Desert Storm illustrate the nature of intelligence and its core concepts and challenges. During this

operation, intelligence provided an accurate picture of the situation confronting Marine forces and identified the enemy's critical vulnerabilities which Marine commanders exploited to achieve success.[11]

By mid-January 1991 the situation at the strategic and operational levels was well understood. Iraqi commanders prepared for the expected Coalition assault into Kuwait in a manner that reflected the success of their defensive strategy during the Iran-Iraq War. They constructed two major defensive belts in addition to extensive obstacles and fortifications along the coast.

Intelligence identified three Iraqi centers of gravity at the operational level. The first was their command and control. If rendered unable to direct its military forces, Iraq would not be able to mount an effective defense at the operational level. Second was Iraq's weapons of mass destruction. Degrading this capability would reduce a major aspect of the Iraqi strategic threat to other states in the region. The third center of gravity was the Republican Guard. Destroying or severely degrading the Republican Guard's ability to fight would dramatically diminish Iraq's capability to conduct a coordinated defense or to pose an offensive threat to the region later.

Intelligence likewise provided thorough understanding of Iraq's critical vulnerabilities: a rigid, top-down command and control system, the reluctance of Iraqi commanders to exercise initiative, an overly defensive approach to battle with

limited ability to conduct deep offensive actions, vulnerability to air attack, an overextended logistics system, and extremely limited intelligence capabilities.

This understanding was used to plan the campaign and guide the conduct of air operations during the first few weeks of Desert Storm. Coalition air attacks had devastating effects on the Iraqis, severely disrupting their command and control, eliminating their naval and air forces, and degrading their logistics capabilities.

Nevertheless, the situation facing Marine commanders was less clear. Much of the intelligence developed prior to the start of the operation was focused on strategic- and operational-level objectives and lacked the detailed, tailored intelligence essential for tactical planning. Further, ground force commanders were not permitted to employ most of their organic collection assets within Kuwait due to concerns about potential casualties, operational security, and initiation of engagements before a decision on ground operations had been made. Marines required support from national and theater intelligence agencies to answer many of their critical intelligence requirements. Although these needs were generally recognized as valid by the higher echelons which controlled these assets, Marine tactical requirements tended to fall too low on the priorities list to compete effectively with other requirements. When national sensors were used to support Marine force requirements, the results often did not provide sufficient detail to fully satisfy those requirements.

Still, by January the Marine forces' intelligence estimate provided a fairly accurate assessment of the overall size and disposition of the Iraqi units as well as the strategy and tactics they would employ. The estimate highlighted four potential Iraqi responses to Coalition air attacks: terrorist attacks inside and outside the area of operations, air and naval counter-strikes, surface-to-surface missile and multiple rocket launcher attacks against Marine positions in the forward area, and a limited-objective ground attack or raid. Like most estimates, this assessment proved to be only partially correct. Iraqi air and naval forces offered minimal opposition, and no major terrorist attacks were conducted. However, there were extensive missile and multiple rocket launcher attacks, and a significant ground attack was launched at the end of the month.

The main shortfall of the estimate was that it lacked details required for tactical planning. Determining the effectiveness of Iraqi forces was a critical requirement. The raw numbers indicated that large Iraqi forces remained within Kuwait. Air attacks were damaging the enemy's forward echelon and had severely degraded both his sustainment and command and control capabilities. There were indications that Iraqi front-line infantry troops were demoralized and would not put up much of a fight. Intelligence clearly showed that the Iraqis had been hurt, but in the absence of definitive information detailing how badly they had been hurt, Marine planning continued to reflect a cautious approach.

During a battle from 29 January to 1 February at Al-Khafji, an Iraqi division-sized ground attack was soundly defeated by Coalition forces. Iraqi actions during this battle provided Marine intelligence specialists critical information to fill in the intelligence picture. Analysis confirmed previous assessments of the deteriorating condition of enemy units and the Iraqis' limited capability to coordinate between tactical echelons. From reports by Marine participants, analysts concluded that Iraqi soldiers were unmotivated, poorly trained, and unable to conduct combined arms operations.

With this insight, previous perceptions of the enemy's strengths and ability to mount a formidable defense were called into question. Subsequent intelligence operations further clarified the threat picture. Interrogations of enemy troops lured to surrender reinforced the view that the Iraqi will to fight was far weaker than anyone had anticipated. Artillery raids failed to elicit counterbattery fire, indicating that Iraqi artillery capabilities had been degraded. Unit boundaries along the defensive belts were located, and gaps in the defenses were identified at those points, confirming that coordination between tactical echelons was poor.

From the new intelligence, a new estimate reflected the likelihood that the Iraqis would be unable to conduct an effective defense of the forward positions. It noted that the Iraqis could not coordinate between units, employ supporting arms, or conduct counterattacks with forces larger than a battalion. Finally, it indicated that Iraqi infantry and artillery troops

would probably surrender en masse once the first shot was fired.

This intelligence was used to substantially revise the Marine operation plan. Knowing that the Iraqis would be unable to assess what was happening on the battlefield or to respond effectively, Marine commanders adopted a more aggressive scheme of maneuver. The previous plan called for a sequential attack with one division following the other through the defensive belts using a single breech point. On February 6, the Marine Force commander approved a new plan in which two Marine divisions would conduct a simultaneous, coordinated attack through the defensive belts at points 40 kilometers apart (see figure 1). In addition, a significant force was now assigned to deal with the expected flood of surrendering Iraqi troops.

The intelligence assessment developed and refined during Operation Desert Storm reduced uncertainty, enhanced situational awareness, and aided Marine commanders in planning and decisionmaking. This assessment did not answer every question, but it did identify the enemy's critical vulnerabilities which were exploited to achieve decisive results.

CONCLUSION

Intelligence is a fundamental component of command and control—inseparable from both command and operations. Accurate, timely, and relevant intelligence is critical to the planning and conduct of successful operations. Effective intelligence uncovers enemy weaknesses which can be exploited to provide a decisive advantage. Shortfalls in intelligence can lead to confusion, indecision, unnecessary loss of life, mission failure, or even defeat.

Intelligence is knowledge of the enemy and the surrounding environment provided to support the commander's decisionmaking process. Intelligence is more than just information; it is the analysis and synthesis of information which provides a meaningful assessment of the situation. Intelligence evaluates existing conditions and enemy capabilities, estimates possible future conditions and enemy courses of action, assists in the development and evaluation of friendly courses of action, and aids in protecting friendly forces against the effects of enemy action.

While intelligence uses specialized capabilities and techniques in developing a useful product, it is not an obscure process isolated from other warfighting functions. In fact, effective intelligence requires a firm focus on the needs of commanders. This in turn, demands integration with all aspects of operational planning and execution. What separates

intelligence from the other aspects of command and control, however, is the fact that intelligence must deal directly with the independent, hostile will of the enemy. Because intelligence attempts to look into the future despite significant unknowns, the resulting product will always be based on estimates, not certainties. Users of intelligence must always remember that intelligence can reduce, but never eliminate the uncertainty that is an inherent characteristic of war, and act accordingly.

Chapter 2

Intelligence Theory

"Many intelligence reports in war are contradictory; even more are false, and most are uncertain. What one can reasonably ask of an officer is that he should possess a standard of judgment, which he can gain only from knowledge of men and affairs and from common sense. He should be guided by the laws of probability. These are difficult enough to apply when plans are drafted in an office, far from the sphere of action; the task becomes infinitely harder in the thick of fighting itself, with reports streaming in."[1]

—Clausewitz, *On War*

"It will be vital to identify centers of gravity rapidly and determine the critical vulnerabilities that will be our pathways to them. We won't always have the luxury of a passive foe, and there's no natural law that says that every high-tech war must be fought in a desert with unlimited visibility and good weather."[2]

—Carl E. Mundy

Having reached a common understanding of the nature of intelligence, we turn now to developing a theory about the intelligence process that in turn will serve as the basis for creating an effective intelligence system.

WHAT DO WE WANT TO KNOW ABOUT THE ENEMY?

In war, it is easier to defeat an enemy we understand, even partially, than to fight an enemy who is an enigma. Intelligence is the means by which we come to understand the enemy. What is it about the enemy that commanders need to learn? The commander needs to gain knowledge at a variety of levels, ranging from that which is quantifiable to that which is purely intangible.

Obviously, we want to know the measurable things: the number of enemy personnel, armored vehicles, artillery pieces, and aircraft. We hope to learn the dispositions, organization, and locations of enemy forces. We also want to obtain technical specifications: the performance characteristics of enemy tanks and aircraft and the range and effectiveness of opposing weapons. Traditionally, intelligence has focused on these tangible factors. They usually provide a concrete image

of the threat and the nature of its combat power. These tangible factors and images thus provide the foundation for developing a more complete understanding of the enemy based upon other intangible factors.

While numbers definitely matter, they provide only partial insight into enemy capabilities. Less quantifiable and more subjectively deduced is the enemy's level of readiness—the state of his training, the quality of his leadership, and the morale of his forces. Commanders need to know the enemy's methods—his doctrine, tactics, techniques, and procedures—as well as his past performance in training and in combat. Even this is not enough. The successful commander cannot truly know an enemy simply through analysis of his physical environment, material might, and political and military institutions.

We must seek still more deeply for those moral and cultural forces which shape the enemy's actions. War is ultimately a human conflict, and much of human nature is decidedly illogical and incalculable. Developing sound intelligence requires an understanding of the institutions, preferences, and habits of a different culture. Commanders must appreciate the values, goals, and past experiences which motivate the enemy. We must gain insight into *why* he fights. To know what motivates an enemy to action requires an identification and appreciation of what the enemy holds dear.

Coming to grips with the intangible aspects of the enemy situation is much more difficult than assessing those factors

that are quantifiable, but it is essential if commanders are to truly understand an enemy. This is exactly what intelligence must endeavor to do—to understand what factors shape an enemy's behavior in order to describe or explain that behavior.

When we try to understand an enemy, it is important to visualize the enemy as he sees himself and to see the situation as he views it. While gaining an objective appreciation for the enemy's capabilities is important, it is equally important to appreciate how the enemy perceives his own capabilities, since it is this image that will have the greatest influence on his actions. The enemy will do what *he* thinks is possible, not what we think he can do.

Seeing the situation from the opponent's perspective is especially important when confronting an adversary with a significantly different set of cultural or societal values. Enemy behavior which appears irrational—and therefore surprising—to us may in fact reflect perfectly reasonable and even predictable actions, given the enemy's values or the information available to him at the time. Consider the use of the banzai charge and kamikaze attacks by the Japanese in World War II or employment of women and children as shields to cover the actions of Somalian clansmen against U.N. forces. None of these actions is rational when viewed from a Western perspective. However, within the context of Japanese or Somalian societal norms, they are less surprising. A commander who fails to understand the enemy on his own terms risks a

fundamental failure to understand the very nature of the conflict.

Finally, intelligence should strive to determine not only the enemy's capabilities but also his intentions. Intelligence estimates deal in both: they describe what an adversary *can* do, and they attempt to discern what he *will* do based upon possibilities and probabilities. Ideally, intelligence should identify several possible scenarios, answering questions such as: *Which is the most likely enemy course of action? Which is the most dangerous?* Intelligence should also correlate the effect of possible enemy actions on friendly plans.

The goal is, therefore, to obtain as complete an understanding of the enemy as possible. The ultimate purpose in seeking this understanding is to *identify enemy centers of gravity and critical vulnerabilities and other limitations that may be exploited* to defeat him: weaknesses in specific warfighting capabilities, numbers, or dispositions; technical deficiencies in weapon systems; or shortcomings in readiness, leadership, or morale. Conversely, intelligence should provide warning of particularly dangerous enemy capabilities that pose a threat to friendly forces.

There are practical limitations to achieving this level of understanding. The effects of uncertainty on intelligence have already been discussed, but it is worth repeating that gaps in our knowledge of the enemy situation are natural and unavoidable. Furthermore, attaining in-depth knowledge on the

variety of potential threats confronting Marine forces is a significant challenge. Our education, cultural appreciation, and experience may be insufficient to provide detailed insight into an adversary without extensive study. The time required for this study may not be available when responding to a developing crisis. In these situations, we build as complete a picture of the enemy as possible in the time available—relying primarily on known factors and likely capabilities—while striving to fill in that picture rapidly as our understanding of the adversary grows.

An example of this approach can be seen in the history of Marine forces' involvement in Somalia. When the 15th Marine Expeditionary Unit landed in Mogadishu to begin Operation Restore Hope in December 1992, Marines had only a basic understanding of Somalian culture, the clan structure, and the threat it presented to U.S. and U.N. forces. Intensive intelligence development, in particular through human intelligence operations, rapidly increased our level of understanding. This intelligence was used over the course of the campaign to plan and execute numerous successful tactical actions that in turn further enhanced the intelligence picture. When the Marines of I Marine Expeditionary Force (MEF) returned in February of 1995 to assist in the final withdrawal of U.N. forces, they were able to draw on an extensive reservoir of intelligence to plan and execute Operation United Shield. Based on this intelligence, I MEF prepared a "playbook" of responses to cover virtually any Somalian reaction. Further, the playbook evolved as new intelligence was

produced and the intelligence estimate changed. The detailed intelligence available contributed directly to the safe and effective accomplishment of the mission.[3]

CHARACTERISTICS OF GOOD INTELLIGENCE

In the previous chapter, we discussed our expectations of intelligence—its capabilities and limitations as well as what can and cannot be reasonably expected of intelligence. As the next step in developing a theory of intelligence, it is important to describe the characteristics of good intelligence.

First, intelligence should be *objective*—as free as humanly possible of bias or distortion. We have already noted that a significant problem in intelligence is not the lack of information, but the difficulty in interpreting that information correctly. Intelligence can be distorted if we attempt to make it conform to preconceived notions, fail to view the situation from the enemy's perspective, or manipulate the intelligence product to support a particular decision or conclusion. For example, prior to Chinese intervention in the Korean War, there were ample indications and warnings of imminent Chinese involvement. However, despite availability of much factual information to the contrary, strongly held preconceptions led commanders and their intelligence officers to conclude that the Chinese would not intervene.[4] Unfortunately, data and

information are almost always susceptible to more than one interpretation and can be manipulated consciously or unconsciously to support preconceived notions.

Second, intelligence should be *thorough*, meaning that it satisfies the intelligence requirements of the commander. Thoroughness does not imply completeness and certainty to the last detail, but rather sufficient depth to assist the commander in reaching sound decisions and developing effective plans. Intelligence personnel should not only identify for the commander what is known but also what is not known. The commander may then assess the risks and decide what actions are worth these risks.

Third, intelligence should be *accurate*, meaning that it should be factually correct. Sound estimates of the enemy's capabilities and intentions must agree with the facts at hand. Since intelligence cannot be precise to the last detail, commanders must have an appreciation of the reliability of a particular intelligence assessment or product.

Fourth, intelligence must be *timely*, meaning that it must arrive in the hands of appropriate decisionmakers in time to affect tactical decisions. Intelligence does not exist for its own sake, but as the basis for taking effective action. The most accurate and valuable piece of intelligence is of no use if it arrives too late to be acted upon. Some kinds of intelligence are more time-sensitive, or perishable, than others—a warning report, for example, is a type of intelligence product

that tends to be highly perishable. It is important to keep this time-sensitivity in mind when dealing with any intelligence product.

Fifth, intelligence should be *usable*, appearing in a form meaningful to and easily assimilated by decisionmakers. Good intelligence should be concise and clear. It must create coherent images—meaningful mental pictures that are immediately and easily understood—rather than present the commander with a mass of unfocused data. Because we generally understand information better when it is presented in the form of images, we attempt to present intelligence in a visual format whenever possible.

Sixth, intelligence should be *relevant* in that it supports the commander's planning and decisionmaking requirements. Relevance means that intelligence is pertinent to the level of command for which it is intended. Relevance means also that commanders are provided information and intelligence bearing significantly on the situation at hand and that they are not burdened with information and intelligence of minimal or no importance. Intelligence that is tailored appropriately for one commander may be too generic or too detailed for commanders above and below that particular level. However, it may be extremely difficult to know in advance what is relevant and what is not. This leads again to the necessity for commanders to focus the intelligence effort.

The value of providing relevant intelligence is illustrated by the following example. Following the bombing of the Marine Corps compound in Beirut in 1983, Department of Defense investigators faulted commanders and intelligence for inundating on-scene commanders with information and failing to provide them with timely intelligence tailored to their specific operational needs.[5] While information overload was certainly not the only cause of the Beirut tragedy, more focused intelligence might have helped commanders prevent its occurrence or at least take greater security precautions.

Finally, intelligence must be *available*—which means that it is readily accessible to appropriate commanders. Availability is a function of both timeliness and usability, but it is also a function of an effective information management system that allows commanders at various levels to readily access the intelligence they need. Availability also means that relevant basic intelligence has been developed in advance and that intelligence assets are maintained in readiness to develop other intelligence products as needed. Finally, availability is a function of effective use of security classifications that protect sources of information while at the same time ensuring that commanders have reasonable access to intelligence.

This discussion is not meant to specify a checklist for what does or does not constitute good intelligence, but to describe the general characteristics which effective intelligence tends to exhibit to one degree or another. Few intelligence products

will exhibit all the above characteristics. Some of the characteristics such as timeliness, usability, and availability are mutually supportable. Others such as timeliness and thoroughness can be in conflict. The extent to which actual intelligence demonstrates each of these characteristics depends on the particular situation.

CLASSES OF INTELLIGENCE

If we could describe a complete intelligence picture—one that provides us everything we need to know about a given situation—that description would include knowledge of established conditions which have existed in the past, unfolding conditions as they exist in the present, and conditions which may exist in the future. Our complete image would include what has been, what is, and what might be. With this background, two classes of intelligence are defined. The first is *descriptive intelligence,* which describes existing and previously existing conditions. The second class, which attempts to anticipate future possibilities and probabilities, is *estimative intelligence.*

Descriptive intelligence has two components. The first is *basic intelligence.* Basic intelligence is general background knowledge about established and relatively constant conditions. Basic intelligence is often compiled in advance of

potential operations and retained in databases or reference publications. Basic intelligence might describe the geography, culture, economy, and government institutions of a potentially hostile nation or area. With regard to the military capabilities and limitations of potential enemies, basic intelligence might detail the size, organization, and equipment of their military forces. These factors may change, but only slowly.

Basic intelligence is often encyclopedic in nature and is consequently often the most mundane. While it tends to be the easiest to gather, often being available through open sources, the depth and detail of the intelligence required to support most operations makes developing basic intelligence a labor-intensive and time-consuming task. Of all the types of intelligence, basic intelligence tends to be the most accurate and reliable. However, basic intelligence is also the most general and least time-sensitive. By itself it rarely reveals much that is decisive. Further, since basic intelligence does not address specific situations, it rarely provides sufficient knowledge for effective decisionmaking. Nevertheless, basic intelligence establishes the necessary foundation for building a more complete intelligence picture.

Descriptive intelligence also includes *current intelligence,* which is concerned with describing the existing situation. In general, current intelligence describes more changeable factors than those addressed by basic intelligence and is therefore more time-sensitive than basic intelligence. For example, while basic intelligence reports climatic norms, current intelligence describes existing weather conditions and its effects

on operations; while basic intelligence shows enemy doctrine and organization, current intelligence depicts actual dispositions, movements, and patterns of activity. At higher levels, basic intelligence describes economies and forms of government; current intelligence addresses ongoing enemy war preparations or the status of relations with other hostile or potentially hostile nations. As a rule, current intelligence tends to be more specific than basic intelligence but less reliable and harder to obtain. Basic intelligence provides the broad picture upon which current intelligence expands by adding specific details about the existing situation.

Estimative intelligence, the second class of intelligence, focuses on potential developments. Developing estimative intelligence is perhaps the most important and at the same time most demanding task of intelligence. Estimative intelligence evaluates the past as delineated by basic intelligence and the present as described by current intelligence and seeks to anticipate a possible future—or several possible futures. It is concerned with determining when, where, how, or even if an enemy or potential enemy will attack or defend. Commanders cannot reasonably expect estimative intelligence to precisely predict the future; rather, estimative intelligence deals with the realm of possibilities and probabilities. It is inherently the less reliable of the classes of intelligence because it is not based on what actually is or has been, but rather on what *might* occur.

Although described as conceptually distinct, the two classes of intelligence are inseparable. Descriptive intelligence provides the base from which estimative intelligence assesses possible or probable futures. Without both classes of intelligence, it is impossible to develop a full image of a hostile situation.

CAPABILITIES VERSUS INTENTIONS

Another way to frame this same discussion is in terms of capabilities and intentions. Descriptive intelligence attempts to discern enemy capabilities and existing conditions. It attempts to answer the questions: "What conditions currently exist? What *can* the enemy do? What *can't* he do?" Estimative intelligence attempts to discern enemy intentions and future conditions. It asks: "What conditions will probably exist in the future? What are their effects on friendly and enemy capabilities and courses of action? What *might* the enemy do? What is the enemy *most likely* to do?" Although the answers to all these questions are estimates rather than certainties, generally we can assess enemy capabilities with greater precision than enemy intentions.

Estimating enemy capabilities is largely a matter of interpreting the facts. Estimating enemy intentions, however, is a

matter of far less certainty. Intentions exist only in the enemy's mind. In any given situation, an enemy commander will probably have several courses of action available. There may be little or no indication of which one he favors. He may be intentionally attempting to conceal his intentions from us, or he may be trying to keep more than one option open. He may be gripped by indecision and not know what he intends to do. Furthermore, he can change his mind. He can respond to changes in the situation or our own actions in ways we cannot anticipate.

Complicating this problem is the reality that an enemy's intentions are normally the product of thought processes different from our own. We are sometimes surprised when an enemy takes an action which we consider to be irrational. However, when viewed from the perspective of the enemy's cultural norms or values, his actions may be perfectly logical and predictable. Unfortunately, it is extremely difficult to gain the depth of insight needed to understand the thought process of each and every potential adversary we face. Our own values and cultural background will always be a significant obstacle in estimating the intentions of terrorists willing to blow themselves up in suicide bombings or a dictator who would inflict massive damage on the environment by setting hundreds of oil wells on fire.

Enemy capabilities and enemy intentions are closely related. Capabilities establish the limits of intentions; the enemy cannot intend to do something beyond his capabilities

and accomplish it successfully. However, it is crucial to note that it is not actual capabilities that matter, but the enemy's perception of his capabilities. The enemy will act based on his perception of his capabilities. His perception may or may not agree with our evaluation of what he can or cannot do. Our analysis of enemy forces in South Vietnam did not credit the North Vietnamese and Viet Cong with the capability to launch a nationwide offensive in 1968. The Tet offensive of that year clearly demonstrated that the enemy believed otherwise.[6] Again, a key element in assessing both capabilities and intentions is the ability to view the situation as the enemy perceives it.

Analysis of capabilities and analysis of intentions are by no means incompatible. Any effective intelligence picture must provide insight into both. Without some appreciation of enemy intentions, it is extremely difficult to decide on an effective plan of action. However, without an understanding of the enemy's capabilities, it is impossible to estimate his intentions.

SIGNALS AND NOISE

Complicating our ability to assess capabilities and estimate intentions is the problem of interpretation of the information we collect. To develop objective and accurate intelligence, we

must understand this problem. We can examine it through a discussion of *signals* and *noise*.[7]

Signals refer to those pieces of information commanders receive that, if properly interpreted, can lead to valuable insight about the situation. Signals help with our situation assessment. Noise, on the other hand, refers to various pieces of useless information—information which is false, out of date, inaccurate, ambiguous, misleading, or irrelevant. An enemy may intentionally present a foe with noise in order to mislead, but noise is not necessarily the product of an enemy deception. Like static on a radio, noise interferes with our reception and interpretation of valuable signals.

The difficulty is to distinguish signals from noise. Unlike the distinction between radio static and the true signal, the difference between true and false information is rarely easy to distinguish. We endeavor to identify critical enemy vulnerabilities, but signals of such vulnerabilities are rarely clear at the time. The recognition of what is important, relevant, and accurate sometimes becomes clear only in hindsight—if then.

Clausewitz advises that, "A sensitive and discriminating judgment is called for; a skilled intelligence to scent out the truth."[8] Just as judgment is no substitute for good intelligence, *intelligence is no substitute for good judgment*. The two must go hand in hand.

This point illustrates the importance of mindset to intelligence. A mindset is a set of assumptions, biases, and preconceptions. A mindset reflects a preexisting image of what is reasonable; it serves as a filter that helps to distinguish the signals from the noise. The human tendency is to be more receptive to information that is consistent with one's mindset and more skeptical of information that is not. In other words, information that is consistent with an existing mindset is interpreted as signals, and information that is not is construed as noise.[9]

Every individual possesses a unique mindset. Biases and preconceptions are also indispensable to intelligence. Without them, it would be impossible to make sense of the available mass of confusing and sometimes contradictory information. Mindsets serve as a frame of reference, enabling us to quickly categorize and assess the relevance and reliability of vast amounts of information. Without a preexisting mindset, commanders would likely be overwhelmed by the amount of information and unable to distinguish between signals and noise.

At the same time, mindsets always bring the danger that we will subconsciously interpret intelligence to comply with our preconceived notions rather than with reality. This hazard applies equally to the producers and users of intelligence.

The danger of preconceived notions and their impact on signals and noise is illustrated by this example from the Arab-Israeli War of 1973.[10] In October 1973, a simultaneous Syrian and Egyptian attack caught the Israeli army badly unprepared. There had been plenty of signals of the Egyptian intentions. The Israeli high command had extremely detailed and accurate information on their enemies' order of battle, unit locations, armaments, and readiness status. In fact, Israeli intelligence was fully aware of unprecedented forward deployments of enemy troops and ammunition stocks. Nonetheless, the possibility of war was discounted until just 8 hours prior to the beginning of the Arab offensive.

The problem was not lack of information, but an inability to filter out noise coupled with reliance on a set of rigid and faulty preconceptions. The Egyptians employed a variety of deception activities, both political and military, to create noise. Included were the continued preparation of defensive positions, repeated repositioning of units along the front, and the use of training exercises as a cover for forward deployments.

Despite the effort to deceive, Israeli intelligence detected most of the key preparations for war. However, even though there was information pointing to an impending attack, the Israeli mindset prevented accurate interpretation of it. The Israelis believed that any Arab attack would be based on military rather than political or psychological factors. Since the Israelis felt that Syrian or Egyptian armies had no capability

to conquer substantial territory from Israel, they discounted any possibility that the Arabs would attack. In fact, the Arab objective was not territorial conquest, but creation of a diplomatic crisis that would be resolved in their favor. Compounding the Israelis' misreading of Arab intentions was the failure of Israeli intelligence to objectively assess Egyptian military capabilities. The Israelis' preconception that the Egyptian army was incompetent caused them to dismiss any possibility that the Egyptians could mount an effective attack. Due to Israeli bias and preconceptions, an overwhelming body of first-rate intelligence that would have provided adequate warning of the attack was simply dismissed as irrelevant.

We seek to develop a balanced mindset that provides a sensitive and discriminating judgment which is not so entrenched that it deafens us to alternative signals. One of the most valuable contributions intelligence personnel can provide is unbiased analyses to uncover and guard against dangerous preconceptions.

LEVELS OF INTELLIGENCE

A complete intelligence picture must also provide insight into the enemy as a complete entity or system, not merely as a collection of unrelated individuals, units, or organizations. Companies, batteries, or squadrons normally do not act independently. They conduct operations in accordance with the

plans and orders of a senior headquarters that in turn is attempting to achieve some strategic or operational objective. In order to understand what the enemy unit directly opposite us is doing now or what it might do in the future, it is usually necessary to examine the capabilities and intentions of enemy units and commanders two levels or more above our immediate adversary.

Developing this type of understanding requires us to consider that intelligence cuts across the three levels of war: tactical, operational, and strategic. As this intelligence varies in terms of scope, application, and level of detail, we divide intelligence into levels which correspond to the levels of war. *Tactical intelligence* concerns itself primarily with the location, capabilities, and possible intentions of enemy units on the battlefield and with the tactical aspects of terrain and weather. *Operational intelligence* pertains more broadly to the location, capabilities, and possible intentions of enemy forces within the theater and with the operational aspects of geography. Finally, *strategic intelligence* is broadest of all in scope and addresses the factors needed to formulate policy and military plans at the national and international levels.

Marine Corps intelligence focuses on tactical intelligence, which is the level of intelligence Marines need, generate, and use most often. However, in order to operate effectively, Marine forces require ready access to operational and strategic intelligence, as well as tactical, to comprehend the larger situation and provide appropriate context for the development of tactical intelligence products.

INTELLIGENCE REQUIREMENTS

A unit's intelligence effort begins with receipt of the mission and the commander's guidance. On-hand intelligence is rarely sufficient to support comprehensive planning and decision-making needs—gaps will remain. Such intelligence gaps are known as *intelligence requirements*.

Intelligence requirements are questions about the enemy and the environment, the answers to which a commander requires to make sound decisions. The breadth of potential intelligence gaps, however, will generally far exceed organic intelligence capabilities. Thus, it is important to focus intelligence operations on those intelligence requirements crucial to mission success. We call these requirements *priority intelligence requirements*.[11]

Priority intelligence requirements are intelligence requirements associated with a decision that will critically affect the overall success of the command's mission. Priority intelligence requirements constitute the commander's guidance for the intelligence collection, production, and dissemination efforts.

The nature and scope of intelligence requirements will vary with the level of command and its mission. Further, the type of operation and at what particular phase of planning or execution the commander states a requirement will be major

influences on its breadth and complexity. However, it is the commander who designates the priority intelligence requirements and therefore provides direction to the intelligence effort.

The importance of clear and focused intelligence requirements was demonstrated during the recovery of Air Force pilot Capt Scott O'Grady from Bosnia in June 1995. After Capt O'Grady was shot down, the 24th Marine Expeditionary Unit (Special Operations Capable) afloat in the Adriatic was placed on alert to conduct a tactical recovery of aircraft and personnel (TRAP) mission. Upon notification that a signal had been received from Capt O'Grady's recovery beacon, the MEU commander designated three priority intelligence requirements: determine Capt O'Grady's exact location, update and reassess air defense threats to the TRAP force, and identify and describe flight hazards to the TRAP force. The clear identification of the critical intelligence needed to execute the mission enabled the MEU intelligence section to concentrate its effort on satisfying those requirements in the few hours it had available.[12]

SOURCES OF INTELLIGENCE

Intelligence information comes from a wide variety of information sources, ranging from a reconnaissance Marine with a

pair of binoculars to a sophisticated electronic sensor. Intelligence information may be derived from any Marine, other human sources, imagery, radar, signals, other emissions or signatures, and open-source references. Effective intelligence operations employ all information sources, whether organic or external. The value of a source is not necessarily related to the sophistication or cost of that source. Sources of information must be appropriate to the nature of the particular intelligence requirement; that is, the collection method or capability used must be appropriate to the aspect of the enemy or the environment about which information is needed. For example, electronic intelligence will likely be of little use against a technologically unsophisticated enemy; human intelligence sources will generally be more valuable. We must tailor the sources to the requirement, ensuring that we exploit both the observations of units in direct contact with the enemy and our more sophisticated sensors.

FUNCTIONS OF INTELLIGENCE

Intelligence performs six specific functions in order to provide knowledge of the threat and the surrounding environment as well as to deny that same knowledge to the enemy.

The first function of intelligence is to *support the formulation of the commander's estimate of the situation* by providing as accurate an image of the hostile situation as possible.

Through this function, intelligence helps the commander gain an initial appreciation for the terrain, weather, and other aspects of the operational environment. Intelligence personnel use techniques (such as intelligence preparation of the battlespace) to estimate enemy capabilities, intentions, vulnerabilities, and possible courses of action. In this manner, intelligence supports initial decisionmaking and planning.

The second function of intelligence is to *aid in situation development*—to provide continuing knowledge of unfolding events to help update the commander's image of the hostile situation. While the commander's initial estimate of the situation takes place before execution and provides the basis for the plan, situation development occurs during execution and provides the basis for adjusting plans to adapt to new circumstances or to exploit opportunities as they arise.

The third function of intelligence is to *provide indications and warnings*. Indications and warnings serve a protective purpose, namely to provide early warning of potential hostile action and thereby lessen the chance of being surprised. Properly used, indications and warnings act as alarms. They alert us to developments that run counter to the commander's planning assumptions and understanding of the situation in time to take necessary actions or precautions.

A fourth function of intelligence is to *provide support to force protection*. Force protection includes defensive operations, security measures, and collection activities undertaken

by a commander to guard the force against the effects of enemy action. Intelligence supports the commander's force protection needs by estimating an enemy's intelligence, terrorism, espionage, sabotage, and subversion capabilities as well as recommending countermeasures against those capabilities. Support to force protection requires detailed assessments of both the capabilities and intentions of the enemy. A successful program of force protection lessens the enemy's ability to take offensive action against us.

The fifth intelligence function is to *support targeting*, a function that intelligence shares with operations. Targeting is the process of acquiring information about targets and choosing the best method for attacking those targets. Intelligence supports this process by locating and portraying targets for attack and by estimating the vulnerability and relative importance of those targets. Targets may be physical targets such as a bridge or enemy position, or they may be functional targets such as the enemy's command and control system.

The final role of intelligence is to *support combat assessment*. Combat assessment is the process used to determine the effects of friendly actions on the enemy. It includes battle damage assessment which refers specifically to the effects of friendly fires on enemy targets. It also applies more broadly the overall effects of friendly actions on enemy capabilities and intentions. Combat assessment provides the basis for future friendly actions as well as a dynamic link back to the first step of the intelligence cycle.

SECURITY

Safeguarding intelligence is an essential consideration. Intelligence is normally less valuable if the enemy is aware of what we know. If the enemy concludes that we are in possession of a key piece of intelligence, he will likely change his plans and thus invalidate the intelligence. Security is important not only because it protects a specific piece of intelligence but also because it protects the sources upon which the intelligence is based. Thus, in the interests of security, the dissemination of and access to intelligence is often restricted.

A tension exists between the legitimate need for security and the essential need for dissemination. On the one hand, we must protect not only the value of individual pieces of intelligence but also the sources which we depend upon to provide additional valuable intelligence in the future. On the other hand, intelligence is useless unless it can be acted upon; to be of value, intelligence must be in the hands of the decision-makers who plan and execute military operations. Finding the proper balance between greater security and wider dissemination is a matter of reasoned judgment based upon the situation, the nature of the intelligence, and the sources involved.[13]

An example of the judgments involved in balancing security and dissemination can be seen in the use of signals intelligence during World War II. The Allies had significant

success in breaking both German and Japanese codes during the war. Because of the sensitivity of the intelligence derived from communications intercepts, the desire to ensure continued availability of this source of intelligence, and the ease with which the enemy could have taken measures to protect their communications, access and dissemination were tightly controlled. Commanders were faced with difficult choices in deciding when and how to use this intelligence, weighing the potential gain against the risk of compromising the source of intelligence. For example, when U.S. cryptologists intercepted advance notification of an inspection tour of the forward area by the commander in chief of the Japanese imperial combined fleet, Admiral Isoroku Yamamoto, American commanders had to decide whether or not to ambush Yamamoto's plane. In this case, they deemed the potential gain of eliminating Japan's best military leader worth the risk of compromising the source of the intelligence. U.S. forces were able to shoot down Yamamoto's plane, resulting in his death—without compromising any U.S. intelligence sources.[14]

THE INTELLIGENCE CYCLE

The intelligence cycle describes the general sequence of activities involved in developing intelligence. The cycle is not meant to prescribe a procedure to be followed, but simply to describe a process which generally occurs. The intelligence

cycle has six phases through which information is planned, obtained, assembled, converted into intelligence, provided to decisionmakers, and, ultimately, used in making decisions. (See figure 2.)

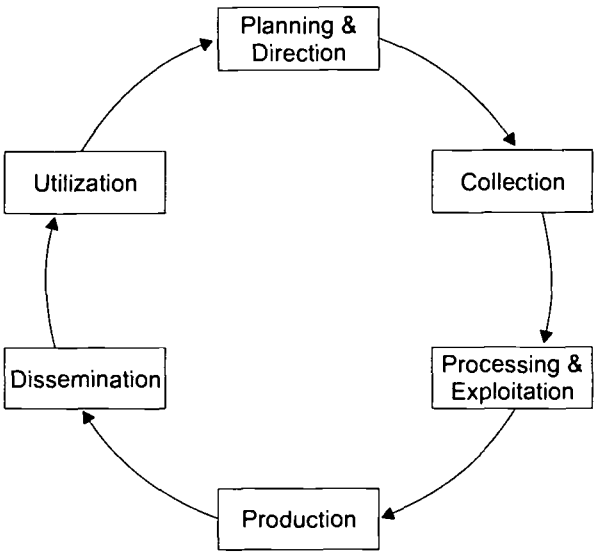

Figure 2.

The first phase in the intelligence cycle is *planning and direction*. This phase consists of the identification of intelligence requirements and the planning of intelligence operations and activities to satisfy those requirements. The

commander directs the intelligence effort; the intelligence officer manages this effort for the commander. In so doing, the intelligence officer is guided by the commander's intent, the established priority intelligence requirements, and specific guidance provided by the commander for the conduct of the intelligence effort. Planning and direction encompasses the supervision of collection, processing, production, and dissemination operations as well as developing the intelligence structure necessary to support planned or ongoing operations.

Collection is the second phase of the intelligence cycle. During collection, organic, attached, and supporting intelligence sources collect and deliver information to the appropriate processing or production unit—or, in some instances, directly to the appropriate commander for immediate action. Effective collection depends upon the use of a variety of mutually reinforcing sources. Necessary, planned redundancy and overlap of sources increase the reliability of information and can reduce the effectiveness of enemy deception or denial efforts.

Processing and exploitation is the third phase of the intelligence cycle, the conversion of raw data into a form suitable for the production of intelligence. Largely a technical function, processing and exploitation converts the data into an understandable form and enhances its presentation. Examples of processing and exploitation include developing and interpreting a piece of film, translating a foreign-language text, or decoding an encrypted radio report. Not all information requires processing; some is collected in a form already suitable for

production. Sometimes processing and exploitation occurs automatically during collection.

The fourth phase of the intelligence cycle is *production*, the activities by which processed data is converted into intelligence. Production involves evaluating the pertinence, reliability, and accuracy of information. It involves analyzing information to isolate significant elements. It includes integrating all relevant information to combine and compare those elements of information with other known information. Finally, production involves interpreting the information to form logical conclusions that bear on the situation and that support the commander's plan to engage the enemy. *Production is a process of synthesis—the most important action in developing usable intelligence for the commander.* Production arranges the intelligence pieces to form coherent images. It is this step which adds meaning to these pieces, creating *knowledge*. Synthesis does not generally create a complete image—totally filling in the gaps and eliminating uncertainty—but it should provide an image from which the commander can reach an acceptable level of understanding. In the end, synthesis answers the all-important question: *"What effect does all of this have on our ability to accomplish the mission?"*

The fifth phase of the intelligence cycle is *dissemination*, the timely conveyance of intelligence in an appropriate form and by a suitable means to those who need it. Depending on

its importance and time-sensitivity, intelligence may be disseminated—*"pushed"*—directly to users, or it can be sent to an accessible data base from which commanders can *"pull"* that intelligence which they need (see figure 3). Intelligence flows by any number of channels or methods. The form intelligence takes can influence dissemination. Some intelligence can be transmitted almost instantaneously to multiple users via a digital communications link, while other intelligence must be physically delivered by courier. The channel or means of dissemination is less important than the arrival of the intelligence at the proper destination on time and in a form readily usable to the commander. Depending on the urgency and time-sensitivity of the intelligence, it may follow established communications channels, or it may be broadcast to the entire force simultaneously as an alert or alarm.

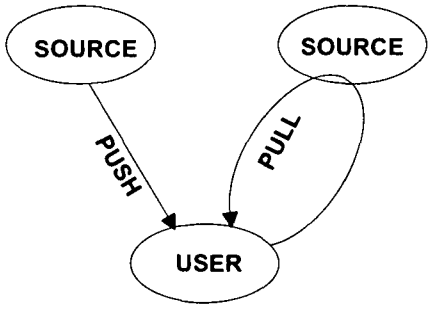

Figure 3.

The final phase in the intelligence cycle is *utilization*. The commander may provide direction, information may be collected and converted into intelligence, and the intelligence may be disseminated, but unless that intelligence is exploited through decision and action, it has served no purpose. Utilization is not a function of intelligence per se, but rather of command and control—making the decision and then carrying it out. This reinforces two important points made earlier: first, intelligence has no value for its own sake but assumes value only when acted upon; and secondly, intelligence is inextricably linked to command and control.

No one phase of the intelligence cycle is more important than the others—they are interdependent. Without proper direction, the other phases will be uncoordinated and ineffective. Without effective collection, there may be too much or too little information, and the information obtained may prove irrelevant. Without processing and production, the resulting mass of information may appear meaningless. Lengthening production time will delay dissemination. The first four phases of the intelligence cycle offer marginal value unless the intelligence arrives to the right person in time and in a useful form to support decisionmaking. Finally, intelligence operations are wasted if commanders fail to understand and act upon the knowledge intelligence offers. For simplicity, the intelligence cycle is described as a sequential method; however, in practice, it is a dynamic process responsive to changes in the situation and the commander's evolving intelligence needs.

A CASE STUDY: VIETNAM 1972

The method used to produce the U.S.'s intelligence assessment of North Vietnam's intentions for 1972 provides an example of the intelligence concepts discussed in this chapter.[15] Forecasting the scope and intensity of the North Vietnamese Army (NVA) and Viet Cong (VC) operations within South Vietnam after the southwest monsoon season ended was the intelligence challenge.[16]

In seeking answers to these questions, intelligence analysts focused on a few key aspects of NVA and VC capabilities. The NVA logistics system often provided a reliable indicator of future activity. The level of NVA resupply activity usually reflected the scope and intensity of planned military operations. A related question was to determine the number of North Vietnamese soldiers moving into South Vietnam and, more specifically, to find out whether these were reinforcements or merely replacements for combat losses of the previous year.

Although there were weaknesses, by 1971 the overall quality of intelligence concerning NVA operations was good. The workings of the enemy's supply system, which had remained relatively unchanged for two decades, were well understood (see figure 4, page 66). Aerial infrared and radar imagery

identified "hot-spots" of activity along the principal NVA resupply route, the Ho Chi Minh trail, and provided indications of the intensity of that activity. Remote ground sensors placed alongside key chokepoints transmitted data on the density and type of vehicular traffic. Long-range ground reconnaissance patrols, signals intelligence, translation of captured documents, and enemy prisoner of war interrogations all helped verify the accuracy of information collected by technical means and improved the overall intelligence picture. There were some problems in the intelligence system as well, one of which was the inability of U.S. intelligence agencies to process, analyze, and synthesize the huge volume of information collected by the technical sensors and other sources.

Analysis of the NVA logistics system did not uncover anything unusual or ominous. As for personnel, they appeared to be predominantly individual replacements with no new NVA or VC units identified. The bottom line of the estimate completed in November 1971 was that 1972 would be "business as usual" without any significant surprises.

By late December, however, new information began to challenge this estimate. The first clues resulted from the analysis of captured documents. A single analyst had detected subtle differences in the tone of South Vietnamese Communist Party documents (which were often filled with hidden messages since the enemy knew some of the documents would be captured) hinting at something big afoot. Shortly thereafter another analyst noted a sudden increase in the flow

of personnel into the south. Further projections showed that if this higher level continued through January, it would greatly exceed numbers needed to replace combat losses.

These two indicators cued new collection operations and a renewed analytical effort. Particularly troubling was a photograph of a tank park located in North Vietnam near the South Vietnamese border. Such a concentration of combat vehicles had never been seen that far south. Finally, additional all-source analysis not only verified continued, unprecedented personnel replacements but also uncovered evidence that two new NVA divisions were headed south and would arrive by late February or early March.

The new intelligence caused a complete overhaul of the previous estimate. The new estimate was published in early January 1972. It concluded that the enemy had the capability to initiate a major escalation of the war during the 1972 dry season, beginning any time after the last week in February, using the equivalent of three new divisions and extensive armor forces. Additional hard intelligence indicated that major attacks would occur from the highlands of central Vietnam south to the delta region.

This revised intelligence estimate provided a minimum of 7 weeks' warning of impending enemy actions. This led to another challenge, one routinely faced by the intelligence professional: the more the user is told, the more the user wants to know. The new intelligence requirement was to determine

more precisely the date the attack would begin. At the same time, operational commanders used the new intelligence to immediately launch an all-out bombing offensive to impede, weaken, or, if possible, destroy the NVA reinforcements. This had the effect of further complicating the intelligence task, as it was impossible to determine what effect the bombing would have on the enemy's plans. The predicted time for the offensive came and went, and the credibility of the estimate began to be challenged.

The bombing had only delayed the attack. On March 30, the NVA and VC launched an unprecedented offensive. Although not as widespread as the 1968 Tet offensive, it brought the commitment of division-sized regular units accompanied by armor and artillery units, some with weapons that outranged those of the U.S. and South Vietnamese. Even with the advance warning, combat actions were prolonged and intense.

Specific indications of the attack were much clearer for the south and central regions of the country and resulted in more effective defensive operations in those regions. Due primarily to the enemy's ability to better conceal his activities in the border region, intelligence did not adequately detect preparations for offensive operations in the northern region. The estimate did not predict major attacks on the north, and the NVA achieved significant successes in the border provinces.

The accuracy and timeliness of the updated January intelligence estimate was a key factor in ultimately repulsing

attacks in the south and central portions of the country. Continuous evaluation of the standing estimate and a willingness on the part of two analysts in particular to challenge conventional wisdom led to this updated assessment. Once initiated, the collection of information from a variety of sources, coupled with in-depth knowledge of the enemy and detailed analysis, provided commanders timely and relevant intelligence they were able to apply to significant advantage.

CONCLUSION

Intelligence strives to build as complete a picture of both the enemy and the area of operations as possible. Such a picture is made up of a variety of factors—the concrete and measurable, the intangible and subjective, the environmental and cultural, the military and political—all of which must be assessed in order to develop the knowledge needed to support the commander's decisionmaking. Building this complete picture requires that we understand and apply the characteristics of good intelligence. Our intelligence picture must be comprehensive; it should combine relevant basic, current, and estimative intelligence from all levels of intelligence. It must include estimates of both capabilities and intentions. Finally, developing an understanding of the situation requires that we be able to distinguish between signals and noise—that we

avoid the pitfalls of bias and preconception while interpreting collected information as objectively as possible.

We employ a variety of conceptual tools to help us in achieving our intelligence objectives. Properly defined intelligence requirements are crucial to providing focus to the intelligence effort. The six intelligence functions outline related tasks which, when accomplished, ensure comprehensive intelligence support to all phases of operational planning and execution. The intelligence cycle provides a process for the development of intelligence. The six steps in the cycle describe a coordinated sequence of activities which results in the production, dissemination, and utilization of accurate, timely, and relevant intelligence.

The object of the intelligence cycle is not to prescribe a procedure which, if successfully applied, will ensure the quality of the intelligence product. The criterion for good intelligence is not whether the different phases have been properly adhered to and whether an accurate, complete, and polished intelligence product has emerged. Likewise, the discussion of the characteristics of good intelligence is not meant as a checklist. These discussions are meant to emphasize that *the sole criterion for good intelligence is whether it provides sufficient knowledge regarding the environment and an understanding of the enemy's capabilities, limitations, and intentions to effectively support the commander's planning and decisionmaking.*

Chapter 3

Creating Effective Intelligence

"To lack intelligence is to be in the ring blindfolded."[1]

—David M. Shoup

"It is refreshing to see things in their proper order—intelligence driving operations, instead of operations driving intelligence . . . As a consequence, we have been able to maintain a constantly high tempo of productive operations."[2]

—Charles E. Wilhelm

Having reached a common understanding of the nature of intelligence and having laid out the main elements of intelligence theory, we can describe the characteristics of effective intelligence. How do we create it within in the Marine Corps?

THE CHALLENGE TO INTELLIGENCE

Before discussing our approach to intelligence, it might be helpful to review the challenges that intelligence faces. What obstacles must intelligence overcome, and what must it accomplish?

Our fundamental premise is that intelligence is not knowledge for its own sake, but instead knowledge for the sole purpose of supporting the commander's decisionmaking needs. Knowledge that cannot be acted upon or that commanders choose to ignore is of little value. Consequently, the Marine Corps recognizes that because intelligence is directly connected to action, it is therefore inseparable from command and operations.

Intelligence attempts to reduce uncertainty about a particular hostile situation. Intelligence is fundamentally an imprecise activity, dealing in estimates and probabilities rather than

certainties. Intelligence must extract meaning from information that is ambiguous, unclear, and sometimes of unknown reliability. It must synthesize disparate information, attempting to create a coherent picture of the enemy and the area of operations. Intelligence should strive to identify enemy centers of gravity and critical vulnerabilities that commanders can exploit. At the same time, it should provide warning of threats to friendly forces.

Intelligence not only provides knowledge of quantitative factors but also, more importantly, affords insight into intangible aspects of the enemy situation such as his goals and motivations. It should not only describe existing conditions and identify enemy capabilities but should also attempt to estimate likely future conditions and enemy intentions. In addition, it should present that knowledge in the form of coherent, meaningful images that are easily assimilated rather than in the form of accumulated lists or texts.

Intelligence strives to answer three basic sets of questions. The first relates to current capabilities and conditions: "What *can* the enemy do? What conditions currently exist?" The second relates to intentions or future conditions: "What *might* the enemy do? What is the enemy *likely* to do? What is the most dangerous thing he may do? What conditions might or are likely to exist in the future?" And the third—and most important—relates to any implications: "What effect might all of this have on our ability to accomplish the mission?"

In short, intelligence must provide the commander with the *practical knowledge that offers exploitable advantages* over the opposition.

INTELLIGENCE IS A COMMAND RESPONSIBILITY

Creating effective intelligence is an inherent and essential responsibility of command. Intelligence failures are failures of command—just as operations failures are command failures.

The Marine Corps' approach to intelligence demands that commanders be personally involved in the conduct of intelligence activities. The commander must specify requirements and provide guidance to ensure a timely and useful product. Commanders must develop an appreciation for the capabilities and limitations of intelligence. This awareness does not mean just an understanding of concepts and theory, but an understanding of the *practical* capabilities and limitations of intelligence personnel, systems, procedures, and products.

The commander begins the process by providing the guidance and direction necessary for the effective conduct of intelligence operations. The commander establishes the priority intelligence requirements that drive collection, production, and dissemination operations. If a commander does not effectively define and prioritize intelligence requirements, the

entire effort may falter. The commander is also required to make the final synthesis of intelligence, arriving at the estimate of the situation which, in turn, serves as the basis for the decision. This is the responsibility of the commander and no one else; while the intelligence officer will provide a recommendation, it is the commander who ultimately determines the meaning of the intelligence provided and how to use it. Additionally, the commander supervises the overall intelligence effort to ensure that the product is timely, relevant, and useful.

Importantly, the commander ensures that intelligence activities support not just the intelligence requirements of the parent unit but the requirements of subordinate commanders as well. The commander should intervene personally when the unit's collection requests or other intelligence support requirements go unsatisfied. Finally, the commander must view the intelligence training of all personnel as a personal command responsibility. This training includes the intelligence awareness of all members of the command as well as the professional development and training of intelligence personnel.

THE COMMAND-INTELLIGENCE CONNECTION

The relationship between the commander and the intelligence officer should be as close as that between the commander and

operations officer. Personal involvement in intelligence does not imply that the commander micromanages the intelligence section or assumes the job of the intelligence officer any more than involvement in operations means that the commander takes over as operations officer. Instead, commanders must provide the guidance and supervision necessary for the intelligence officer to support them while at the same time allowing the intelligence officer sufficient latitude for initiative.

In reality, however, the relationship between a commander and intelligence officer is often more difficult to establish and maintain. One reason is that the commander and operations officer usually have more in common in terms of grade, military occupational specialty, age, and experience. In the perspective of some officers, an operations billet is a prelude to command, and many commanders have previously served tours of duty as operations officers in the very same type of unit they now command. Commanders rarely have had the same sort of practical experience in intelligence billets. Consequently, commanders must promote an environment of cooperation, professional support, and mutual respect between themselves and their intelligence officers in which operations and intelligence officers can work together to execute their commanders' intent.

Intelligence requirements are the commander's requirements and not those of the intelligence officer. The commanding officer must provide early and adequate guidance and revise it when necessary. The commander identifies what

intelligence is needed while the intelligence officer helps in stating the priority intelligence requirements to meet those needs.

The intelligence officer is not simply a researcher waiting for a task from the commanding officer. *An intelligence officer is an operator who understands the intelligence needs of the unit.* The intelligence officer is knowledgeable of the tactical situation and can anticipate the commander's intelligence requirements based on an understanding of the commander's intent and the commander's thought processes. The intelligence officer actively advises the commander on just what intelligence may contribute to success and aggressively carries out intelligence operations to fulfill the intelligence needs of the command.

While the relationship between commander and intelligence officer should be close, they must be careful not to lose their objectivity. The commander and intelligence officer may not always agree on their respective estimates of the hostile situation—this is natural and to be expected. Once the intelligence officer has provided a candid, objective estimate, the commander will assess it and make an independent judgment. Once the commander has made a decision, the intelligence officer must support it fully—while maintaining the detachment necessary to advise the commander if the situation changes or if new evidence indicates that the commander's estimate appears wrong.

During planning and wargaming, the commander will often instruct the intelligence officer to assume the role of an adversary—to attempt to think like the enemy commander—as a means of gaining insights into possible enemy intentions, actions, and reactions. Thus, the intelligence officer often plays the role of devil's advocate, identifying possible ways that the enemy or the environment may interfere with or even defeat friendly plans. In this manner, the intelligence officer helps the commander analyze possibilities and prepare responses to possible developments.

Commanders must exercise caution so as not to judge the effectiveness of intelligence by how accurately it has predicted reality. Commanders must realize that intelligence is the business of estimates, not certainties. A commander harboring unrealistic expectations may discover that the intelligence officer is reluctant to risk any predictions for fear of being wrong. The commander must encourage the intelligence officer to estimate enemy possibilities frankly and not merely provide "safe" facts and figures. Far from being merely a provider of facts and figures—or even a provider of estimates on enemy courses of action—*the intelligence officer should offer trusted advice on friendly courses of action based on knowledge of the hostile situation.*

THE INTELLIGENCE-OPERATIONS CONNECTION

The relationship between intelligence and operations should be as close and direct as that between intelligence and command. In addition to intelligence's influence on the conduct of operations by identifying enemy capabilities and estimating enemy courses of action and possible reactions to friendly courses of action, intelligence also provides important support to operations by helping to identify *friendly critical vulnerabilities* that the enemy may exploit. Thus, the intelligence and operations sections must function in close cooperation throughout the planning and execution of an operation. Neither section can perform effectively without the continuous cooperation of the other.

As in the relationship with the commander, the intelligence officer should cooperate fully with the operations officer but should not develop a personal stake in a particular course of action. Based on knowledge of the hostile situation, the intelligence officer must maintain the freedom to offer advice which disagrees with the advice of the operations staff.[3]

Intelligence officers are themselves operators. The intelligence officer does everything the operations officer does, only in red ink—meaning from the enemy, rather than friendly perspective. The intelligence officer must possess an intimate knowledge of the enemy's methods, capabilities, organizations, and tendencies. At the same time, in order to

effectively plan, coordinate, and execute intelligence operations, the intelligence officer requires an in-depth understanding of friendly tactics, capabilities, and intentions.

The relationship between operations and intelligence necessitates mutual support. Just as intelligence identifies opportunities for exploitation through operations, so can operations provide the stimulus for intelligence. Regardless of the primary mission, all operations have an additional object of gaining information about the enemy and the environment. Some operations possess this goal as the primary mission. For example, the objective of a tactical maneuver such as a reconnaissance in force may be to learn more about enemy capabilities and disposition or to solicit the enemy's reaction to a specific situation.

The importance of the intelligence-operations connection is seen in the contrasting approaches to intelligence used by the Luftwaffe and the Royal Air Force (RAF) during the Battle of Britain. The RAF placed intelligence officers throughout the organization down to the squadron level. Thus aircrews received the latest intelligence during tailored premission briefings, and information collected during combat was immediately available for analysis, dissemination, and utilization. In contrast, the Luftwaffe placed intelligence officers at the wing level only. Intelligence support to flying groups and squadrons was marginal throughout the battle, and its lack contributed to the German defeat.[4]

The direct connection between intelligence and operations results in intelligence shaping or even driving the course of operations. Intelligence operations seek to uncover enemy vulnerabilities we can exploit. Opportunities identified by the intelligence effort are used to develop the concept of operations during planning and to initiate specific tactical actions during execution. Effective intelligence guides us towards enemy weaknesses rather than forcing us to operate against an enemy strength.

The invasion of Tinian during World War II provides an illustration of how intelligence shapes operations. Initial intelligence studies of Tinian identified only one suitable landing area for the amphibious assault. This area was located immediately in front of the island's major settlement, Tinian Town, and was heavily defended by the Japanese. The studies noted the existence of two small inlets on the northern tip of the island but discounted their suitability for a major landing (see figure 5). As planning progressed, new intelligence identified major disadvantages in attacking across the Tinian Town beaches. At the same time, additional studies indicated that a landing on the undefended northern beaches was a viable option. Preassault reconnaissance confirmed the suitability of these beaches. The concept of operations called for regimental-sized landings to be conducted on two small northern beaches (White 1 and White 2) that totaled in width only about 220 yards. The main landing would be supported by an amphibious demonstration conducted near Tinian Town.

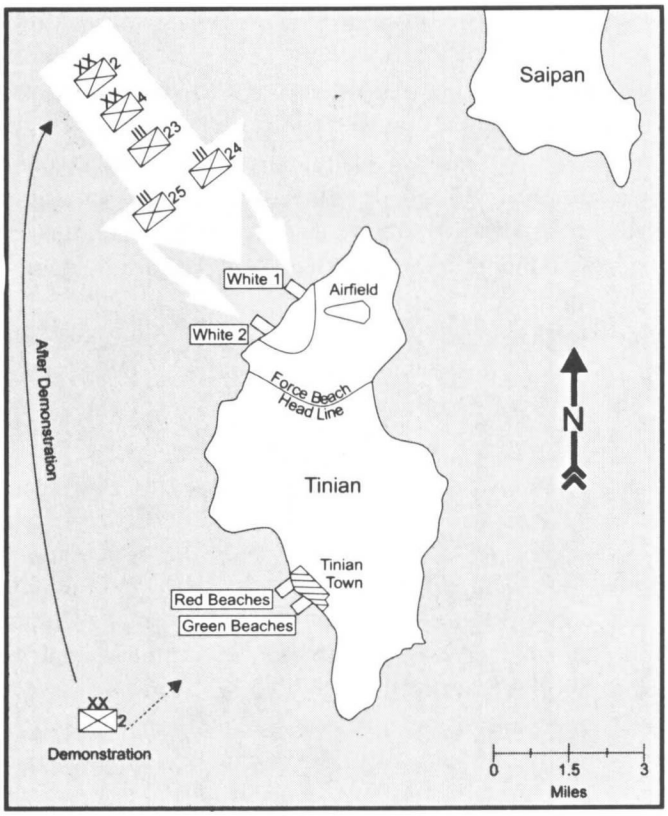

Figure 5.

The amphibious assault achieved complete tactical surprise. Landing against minimal opposition on the northern

beaches, the entire 4th Marine Division was established ashore by the end of the first day. The island was secured in 9 days with minimal casualties suffered by the landing force. The Tinian operation was described by Admiral Raymond Spruance as, "probably the most brilliantly conceived and executed amphibious operation in World War II." Intelligence contributed significantly to the success of this operation, providing commanders with knowledge of a critical vulnerability—the undefended northern beaches—which they exploited to achieve success.[5]

INTELLIGENCE AS A TEAM EFFORT

Intelligence is the commander's responsibility and the intelligence officer's primary duty, but it is also definitely the concern of every Marine. All Marines in the command contribute in one way or another to the intelligence effort. Nearly every Marine, regardless of occupational specialty, has occasion to observe significant facts about the enemy or the environment. Units in contact with the enemy are a particularly valuable source of information. All Marines should consider themselves as potential intelligence sources and, equally important, as counterintelligence assets. Everyone on the battlefield should be alert for important information and bring that information to the attention of the person who needs it by the most direct and expeditious means available.

INTELLIGENCE IS A PRODUCT, NOT A PROVISION

Intelligence is something generated through our own efforts, rather than something provided by some outside source. While we may say that in principle we should have ready access to external sources like satellite imagery, basing our actions on the timely availability of such information is dangerous. Commanders should aim, to the greatest extent possible, to become self-sufficient in satisfying their own intelligence requirements. This approach is particularly important once an operation has commenced. Before operations begin, intelligence from higher echelons may appear to be available in unlimited quantities. However, once execution starts, our organic intelligence and reconnaissance assets generally provide the most reliable and responsive support to Marine units. Marines cannot forget that intelligence is the result of solid headwork and legwork, and it is not provided from some omniscient source of knowledge. Requirements for critical intelligence should be satisfied through organic means whenever possible.

A BALANCED APPROACH

The approach of the Marine Corps to intelligence calls for balance in a number of areas. First is the capability to gather information from a variety of sources. Each source provides a

different type of information. These different sources can compensate for, complement, and confirm one another. Depending on the situation, certain sources will be more valuable than others. Which source we most depend upon in a particular situation is less a matter of our own preference than a matter of the nature and sophistication of the enemy.

Next, balance means that commanders emphasize equally all phases of the intelligence cycle. For example, an overemphasis on collection may result in an overload of information that overwhelms processing and production capacity, thus preventing rapid dissemination. Balance also means that commanders emphasize the development of both classes of intelligence—descriptive and estimative. Balance requires that intelligence personnel work at uncovering both the enemy's capabilities and the enemy's intentions. Balance means that we take into account both quantitative factors—such as numbers, locations, equipment specifications—and qualitative factors—morale, motives, leadership, and cultural values.

Finally, our approach to intelligence should achieve balance in its support to commanders at all levels. At any particular level, the intelligence officer's first duty is to serve the commander's intelligence requirements. However, since questions about the enemy situation and area of operations are practically limitless, an intelligence section can easily spend all its time satisfying intelligence requirements of its own staff or higher headquarters—to the neglect and detriment of subordinate commanders' intelligence needs.

Commanders must provide the necessary guidance to ensure that balance is achieved. Intelligence personnel must remain conscious of the intelligence requirements of all elements of the force with the objective of creating satisfactory intelligence for all supported commanders.

FOCUSING THE INTELLIGENCE EFFORT

Focus, as embodied in the concept of main effort, is central to maneuver warfare. It is particularly critical for intelligence since possible questions about the enemy situation are nearly infinite, while intelligence assets are limited. Commanders must concentrate intelligence operations on those critical requirements upon which mission success depends and prioritize accordingly. *The intelligence effort must support the main effort.* In fact, intelligence is responsible for identifying the enemy's centers of gravity and critical vulnerabilities that are used to determine the main effort.

Focus is a product of direction, which means it is a function of command. The commander provides focus to the intelligence effort by prioritizing intelligence requirements. These requirements establish priorities for all intelligence activities—not only for collection but also for processing, production, and dissemination. The earlier the commander

establishes this guidance, the more focused, timely, and complete the final intelligence product will be.

GENERATING TEMPO THROUGH INTELLIGENCE

Tempo is central to maneuver warfare and our command and control doctrine. We seek to generate a higher operating tempo than that of the enemy. Effective intelligence supports this accelerated tempo. We help create this rapid tempo through a variety of techniques.

First, we generate tempo through *prioritization*. We establish a limited number of priority intelligence requirements that are understood clearly throughout the force. Collection, processing, production, and dissemination operations are conducted in accordance with these priorities. By concentrating on the truly essential requirements, we avoid diluting intelligence operations and clogging dissemination channels with nonessential intelligence.

Another way we use intelligence to accelerate tempo is through *decentralization*—establishing command relationships or task-organizing intelligence assets to directly support subordinate commanders. Decentralizing intelligence resources applies not only to collection assets but to production and dissemination assets as well. Decentralization provides

subordinate elements with the intelligence resources needed to recognize and exploit opportunities as they arise in the battlespace. It also helps ensure intelligence products are tailored to the requirements of commanders at lower echelons. However, decentralization does not mean that intelligence assets will be fully dispersed throughout the force or that each unit will have an equal share of the available intelligence units, systems, or personnel. Since intelligence assets are limited, it is virtually impossible to provide each unit with all the intelligence capabilities its commander may desire. Assets will be allocated based on the commander's intent, the designation of the main effort, and the priority intelligence requirements.

The third technique by which we generate intelligence tempo entails a conscious command decision *to disseminate certain information before it has been fully integrated, analyzed, evaluated, and interpreted*—in other words, before it becomes a comprehensive intelligence product. This approach recognizes that at times a piece of information may be so critical and time-sensitive that it should be disseminated immediately with minimal evaluation and analysis. In a sense, this amounts to decentralizing intelligence production by requiring subordinate units to perform immediate intelligence production. Immediate production rapidly identifies, evaluates, and disseminates intelligence that may have an impact on ongoing operations in order to exploit opportunities and generate tempo. For example, the commander may establish criteria that require the immediate dissemination of any reporting on certain critical enemy targets. The dilemma, which

we must resolve on a case-by-case basis, is between the desire to provide as complete and accurate an intelligence product as possible and the requirement to support the urgency of tactical decisionmaking.

Accessibility is a fourth mechanism by which we may accelerate tempo. Accessibility increases tempo by making intelligence available to commanders for use in decisionmaking. Here we make another conscious command decision—in this case to make intelligence more accessible to users by *minimizing security restrictions or by relying more on open sources*. We can do this by "sanitizing" classified intelligence to protect sources without materially decreasing the value of the intelligence. More important, we should make a conscious effort to ensure that intelligence is classified only to the minimum degree essential to the interests of security.

A fifth way of generating tempo is by ensuring that intelligence products take the *form* most readily understandable by users. This generally means that *intelligence should be presented as meaningful images, rather than reports or lists which require more time to assimilate.* For example, displaying a possible enemy course of action in a graphic with supporting text annotated on the graphic is generally more useful than providing only a text report.

Finally, we can enhance tempo through effective *information management*—taking advantage of all available communication channels and means for disseminating intelligence.

Intelligence, like any other information product, flows not only through established hierarchical channels but also by alarm channels, flowing laterally and diagonally as well as vertically (see figure 6). In other words, rather than simply forwarding information or intelligence via standard channels, we must ask ourselves, "Who really needs this information most?" and transmit that information by the most direct and readily accessible means.

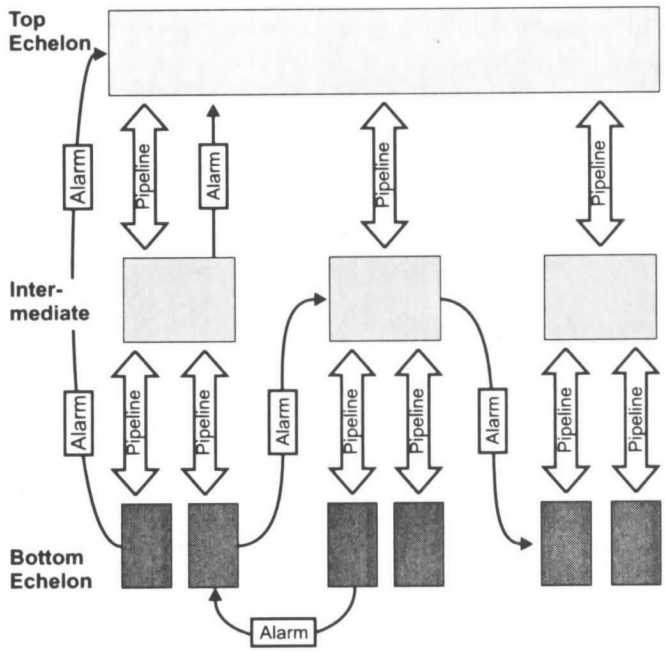

Figure 6.

The ability to generate tempo through intelligence was vividly demonstrated in a series of combat actions during the early years of the Vietnam war. A small number of documents recovered from a Viet Cong commander killed by a Marine ambush patrol identified a likely enemy training base. Using this intelligence, the next day a Marine combined arms assault surprised and effectively destroyed five enemy companies. Immediate searches of the area led to additional intelligence locating another enemy battalion, which was also quickly attacked, causing heavy personnel and material losses. Follow-on all-source intelligence analysis of both engagements swiftly identified the most likely infiltration routes used by these enemy units, allowing a Marine infantry company a few nights later to successfully ambush a reinforced enemy battalion. A few captured documents combined with rapid dissemination and utilization of the resulting intelligence led directly to a series of successful tactical actions.[6]

INTELLIGENCE EDUCATION AND TRAINING

Intelligence education and training are a command responsibility. Professional development programs must give all Marines an understanding of the capabilities and limitations of intelligence as well as the employment of intelligence assets. Education and training should likewise provide intelligence personnel with an in-depth understanding of operations

so that they may better support operations with intelligence. Moreover, education and training programs should seek to strengthen the relationship between intelligence officers and commanders by increasing their mutual understanding.

Commanders must demonstrate personal involvement in intelligence training. They must dedicate adequate training time to it and ensure that intelligence is realistically integrated and balanced with other warfighting activities. The commander is responsible for ensuring that all the unit's Marines have a basic understanding of the threat and the environment in likely areas of deployment. Classroom instruction, professional reading, discussion groups, and use of wargames with realistic scenarios and threat forces are ways to build such knowledge.

Exercises must be used to reinforce and increase the intelligence awareness of the unit. Exercises should incorporate realistic intelligence to the maximum extent possible. This provides participants with the opportunity to identify their intelligence requirements, allows them to see how intelligence is collected, produced, and disseminated, and exposes them to the type and quantity of intelligence support they can expect to receive during actual operations.

The value of incorporating realistic intelligence into exercises was demonstrated during Operation Praying Mantis in

1988. The commander of a Special Purpose Marine Air-Ground Task Force (MAGTF) based his training scenarios on actual intelligence studies of potential raid sites in the Persian Gulf. For the execution of the operation, the MAGTF was directed to attack the "Sassan" gas-oil platform, a target the MAGTF had used in its training exercise the week before. The use of realistic intelligence during training gave the MAGTF commander the necessary background knowledge and situational awareness to rapidly complete the plan.[7]

Opposed, free-play exercises are especially valuable, providing the opportunity to conduct intelligence operations in realistic conditions. To use an intelligence staff to create an exercise scenario, with all the pertinent intelligence already generated in advance, is a misuse of assets. Such a scheme robs an exercise of all-important realism in the development and use of intelligence to support decisionmaking. Within the practical limitations of available resources, "scripted" exercise intelligence should be minimized in favor of intelligence generated during the actual exercise.

In the training and education of intelligence personnel, we seek to achieve a balance between specialization and generalization. *Intelligence officers must possess a broad operational orientation*—an understanding of just how intelligence supports operations in general terms—while also developing the specialized skills required by many intelligence disciplines. We should nurture intelligence officers who can synthesize as well as analyze—who can answer the "So what?" question.

Finally, we should stress the importance of foreign area and foreign language training in order to build our understanding of potential enemies and operating environments.

A CASE STUDY: SOMALIA 1992–1993

In December 1992, lead elements of the 15th Marine Expeditionary Unit landed in Mogadishu, Somalia, initiating Operation Restore Hope, a multinational humanitarian assistance operation. Remaining elements of Marine Forces (MARFOR) Somalia followed shortly thereafter. MARFOR intelligence operations illustrate the importance of a commander's involvement in the intelligence effort and of close coordination between intelligence and operations.[8]

The intelligence situation at the start of Operation Restore Hope was typical of what can be anticipated for most military operations other than war, particularly from the tactical perspective: outdated basic intelligence, sketchy current intelligence regarding the order of battle, capabilities, intentions, and vulnerabilities of potential threat forces, and limited understanding of possible reactions from either the civilian populace or the many nongovernmental organizations long operating in the country.

From the beginning, the commander ensured that MARFOR intelligence and operations elements worked as a team. The commander set the direction for MARFOR intelligence operations by focusing the collection and production efforts. During the initial stabilization phase of operations, intelligence requirements were focused on the organization and leadership of the Somalian clans, boundaries between the clans, and the locations of meeting places, weapons caches, and arms markets. Both intelligence and operations personnel worked to acquire information and develop understanding of the nongovernmental organizations, the status of the local infrastructure, and the cultural aspects of the local population. During the subsequent normalization phase of the operation, intelligence priorities shifted to requirements in support of the civil affairs effort: preserving freedom of movement and commerce throughout the country, determining the effectiveness of civilian authorities, and estimating the attitudes of the clans and the average Somali to U.S. and U.N. efforts.

Collection operations reflected the unique challenges of the humanitarian assistance mission. A considerable amount of information was acquired from foot, motorized, and mechanized patrols. Helicopter visual reconnaissance missions and postmisson debriefs typically provided timely confirmation of information acquired during patrols. The MARFOR's principal human intelligence resources, its counterintelligence and interrogator-translator teams, were exceptionally effective in this environment.

Counterintelligence specialists and interrogator-translators were routinely attached to or placed in direct support of units down to battalion and regimental level. Their immediate availability and integration into unit intelligence collection and other operational activities allowed intelligence officers to rapidly develop pertinent tactical intelligence. In most instances, intelligence was immediately provided to and acted upon by MARFOR operational elements. When more complex targets were identified, intelligence was used to plan and execute sophisticated direct action missions. The effective development and use of intelligence led to the capture of hundreds of weapons and tons of ammunition and supplies. Intelligence contributed directly to the establishment of a secure environment for the conduct of relief activities.

The MARFOR commander characterized human intelligence operations as "providing in-by-nine, out-by-five service on priority intelligence requirements. As a consequence, we have been able to maintain a constantly high tempo of productive operations. The key word here is productive. Patrols, checkpoints, and direct action missions have, for the most part, been directed against clearly defined targets—there have been remarkably few dry holes."[9]

CONCLUSION

The Marine Corps' philosophy of intelligence recognizes that intelligence is an inherent responsibility of command. The commander's direct involvement is required to provide appropriate guidance to the intelligence effort and ensure the full utilization of the intelligence product. Our philosophy also acknowledges that intelligence is inseparable from operations and that effective intelligence shapes or even drives operations. Without close and continuous cooperation, neither intelligence nor operations can function effectively.

Our intelligence philosophy relies on a variety of sources, does not emphasize one phase of intelligence activity at the expense of another, and provides support to all levels of the force. This approach recognizes the importance of qualitative as well as quantitative information requirements. It focuses on priority intelligence requirements, seeking to avoid diffusion of effort. The Marine Corps' intelligence philosophy acknowledges the importance of tempo and uses effective intelligence operations to develop and maintain tempo. Finally, this approach to intelligence recognizes that the obtaining of useful information about an adversary is a team effort and requires that all Marines see themselves as intelligence and counterintelligence resources contributing actively to the intelligence effort.

Forward

The future for our Army is challenging. In order to prepare for an unknowable future, the Army must be ready to conduct the full range of military operations, with a focus on large-scale combat operations. The Army will operate across multiple domains with unified action partners. We must deploy and transition rapidly to large-scale combat operations, present multiple dilemmas to the enemy, operate dispersed while maintaining decisive effects, and consolidate gains.

Intelligence, especially warning intelligence and other aspects of setting the theater of operations, is integral to operations, as the theater army competes with peer threats below the level of armed conflict. Friendly forces attempt to maintain an enduring initiative during operations to shape and prevent. However, enemies are likely to initiate hostilities against friendly forces from initial positions of relative advantage.

Therefore, Army forces will conduct operations across multiple domains to gain freedom of action for other members of the joint force. Units must be prepared to fight for intelligence against a range of threats, enemy formations, and unknowns. These challenges include integrated air defense systems and long-range fires, counterreconnaissance, cyberspace and electronic warfare operations, deception operations, and camouflage.

These complexities place a significant demand on intelligence professionals for real-time detailed intelligence to develop situational understanding and answer the commander's priority intelligence requirements. Intelligence enables mission command, facilitates initiative, and allows commanders and staffs to execute tailored solutions for complex problems in the fast-paced environments of the future. From this understanding, commanders can better identify windows of opportunity during operations to converge capabilities for best effect. Ready access to the intelligence networks facilitates timely decision making and provides commanders the flexibility to successfully shape and execute operations.

ADP 2-0, Intelligence, provides a common construct for intelligence support in complex operational environments and a framework to support unified land operations across the range of military operations. This publication serves as the intelligence doctrinal foundation for our Army. Every Army professional must understand the doctrinal principles of Army intelligence.

Preface

ADP 2-0 is the Army's most fundamental publication for Army intelligence. ADP 2-0 provides a common construct for intelligence doctrine from which Army forces adapt to conduct operations. ADP 2-0 augments and is nested with the capstone doctrine from both ADRP 3-0 and FM 3-0.

The principal audience for ADP 2-0 is every Soldier and Department of the Army Civilian who interact with the intelligence warfighting function. This publication is the foundation for the intelligence warfighting function and subsequent doctrine development. It also serves as a reference for personnel who are developing doctrine, leader development, materiel and force structure, and institutional and unit training for intelligence.

Note. The Army does not have a specific military occupational specialty for open-source intelligence; it does not have base tables of organization and equipment for open-source intelligence units or staff elements.

Commanders, staffs, and subordinates ensure their decisions and actions comply with applicable United States (U.S.), international, and, in some cases, host-nation laws and regulations. Commanders at all levels ensure their Soldiers operate in accordance with the law of war and the rules of engagement. (See the Department of Defense [DOD] Law of War Manual, CJCSI 3121.01B, and FM 27-10.)

This publication contains copyrighted material.

ADP 2-0 uses joint terms where applicable. Selected joint and Army terms and definitions appear in both the glossary and the text. Terms for which ADP 2-0 is the proponent publication (the authority) are marked with an asterisk (*) in the glossary. Definitions for which ADP 2-0 is the proponent publication are boldfaced in the text. For other definitions shown in the text, the term is italicized and the number of the proponent publication follows the definition.

ADP 2-0 applies to the Active Army, the Army National Guard/Army National Guard of the United States, and the U.S. Army Reserve unless otherwise stated.

The proponent of ADP 2-0 is the U.S. Army Intelligence Center of Excellence. The preparing agency is the Directorate of Doctrine and Intelligence Systems Training, U.S. Army Intelligence Center of Excellence, Fort Huachuca, Arizona. Send comments and recommendations on a DA Form 2028 (Recommended Changes to Publications and Blank Forms) to Commander, U.S. Army Intelligence Center of Excellence, ATTN: ATZS-DST-D (ADP 2-0), 550 Cibeque, Fort Huachuca, AZ, 85613-7017; by e-mail to usarmy.huachuca.icoe.mbx.doctrine@mail.mil; or submit an electronic DA Form 2028.

Introduction

KEY DOCTRINAL CONCEPTS

Operations and intelligence are closely linked. The intelligence process is continuous and directly drives and supports the operations process. This principle will remain true well into the future. Intelligence will continue to be a critical part of the conduct—planning, preparing, executing, and assessing—of operations. Future operations will be difficult. They will occur in complex operational environments against capable peer threats, who most likely will start from positions of relative advantage. U.S. forces will require effective intelligence to prevail during these operations.

Intelligence supports joint and Army operations across unified action, the Army's strategic roles, unified land operations, and decisive action at each echelon—from the geographic combatant command down to the battalion level. Specifically, intelligence supports commanders and staffs (through mission command) by facilitating situational understanding across all domains and the information environment. Commanders and staffs use situational understanding to identify and exploit multi-domain windows of opportunity and to achieve and exploit positions of relative advantage.

Intelligence is inherently joint, interagency, intergovernmental, and multinational. Every aspect of intelligence is synchronized, networked, and collaborative across all unified action partners. This synchronization occurs through national to tactical intelligence support. The Army both benefits from and contributes to national to tactical intelligence and focuses the Army intelligence effort through the intelligence warfighting function, which is larger than military intelligence. Critical participants within the function include commanders and staffs, decision makers, collection managers, and intelligence leaders.

Despite a thorough understanding of intelligence fundamentals and a proficient staff, an effective intelligence effort is not assured. Large-scale combat operations are characterized by complexity, chaos, fear, violence, fatigue, and uncertainty. The fluid and chaotic nature of large-scale combat operations causes the greatest degree of fog, friction, and stress on the intelligence warfighting function. Threat forces will attempt to counter friendly collection capabilities by using integrated air defense systems, long-range fires, counterreconnaissance, cyberspace and electronic warfare operations, camouflage and concealment, and deception.

Ensuring an effective intelligence effort is a challenge described as fighting for intelligence. The following aspects of fighting for intelligence are critical:

- Effective intelligence requires developing an effective intelligence architecture well before large-scale combat operations.
- The commander must own the intelligence effort.
- The commander and staff—
  - Must forge an effective relationship and excel in staff integration.
  - Must understand intelligence limitations, especially collection gaps, at their echelon and overcome or mitigate those limitations through effective information collection.
  - At times, may have to conduct combat operations or find creative solutions to enable information collection.
- The unit must adjust the information collection plan, adapt to threat counter-collection measures, and maintain a layered and aggressive information collection effort.

The introductory figure on pages viii and ix illustrates the nesting of intelligence with operations.

EXECUTIVE SUMMARY

This version of ADP 2-0 marks a significant departure from the August 2012 versions of ADP and ADRP 2-0. The publication was deliberately changed to nest ADP 2-0 with FM 3-0 and to help focus the Army on the new challenges associated with large-scale combat operations. Despite the change in focus, the intelligence fundamental concepts remain but with some modifications.

This executive summary highlights the most important aspects of each chapter and the most significant changes from the last version. Additionally, each bullet includes the page number (in parenthesis) where that topic is discussed in this publication.

ADP 2-0 contains five chapters:

Chapter 1 discusses how intelligence nests with the most fundamental operational doctrinal concepts. In order to understand Army intelligence, it is important to understand intelligence within the larger context of FM 3-0. From national and DOD levels down to the Army battalion level, intelligence is an activity that is never at rest. Army forces are globally engaged, always executing operations and preparing for future operations as part of a joint team.

This chapter—

- Provides an overview of—
  - Large-scale combat operations. (1-1)
  - Unified action and joint operations. (1-5)
  - The Army's strategic roles. (1-6)
  - Unified land operations. (1-6)
  - Decisive action with subordinate discussions on the offense, defense, stability, and defense support of civil authorities. (1-7)
- Updates discussion of the operational environment. (1-2)
- Updates the discussion of the threat. (1-4)
- Discusses intelligence support within *multi-domain operations*. (1-10)

Chapter 2 discusses the most fundamental intelligence doctrinal concepts. Intelligence support is critical to operations and occurs at each echelon, from theater army down to the battalion level. In order to drive intelligence, the commander and staff must understand the intelligence warfighting function, the intelligence core competencies, national to tactical intelligence, setting the theater, and establishing the intelligence architecture.

This chapter—

- Discusses the *purpose of intelligence.* (2-1)
- Updates the discussion of the *intelligence warfighting function.* (2-2)
- Updates the description of the *intelligence core competencies* and introduces *intelligence processing, exploitation, and dissemination (PED)* as a fourth intelligence core competency. (2-4)
- Introduces PED as a term and updates the PED discussion to include intelligence PED. (2-5)
- Introduces *national to tactical intelligence*, which replaces the discussion of *intelligence enterprise* from the August 2012 version of ADRP 2-0. (2-6)
- Introduces and discusses *regionally aligned forces* and *setting the theater* for intelligence in Army forces. (2-8)
- Introduces and discusses *establishing the intelligence architecture* as a capability. (2-8)

Chapter 3 discusses the most important intelligence doctrinal construct—the intelligence process. The intelligence process is a model that describes how the intelligence warfighting function facilitates situational understanding and supports decision making. This process provides a common framework for Army professionals to guide their thoughts, discussions, plans, and assessments.

This chapter—

- Discusses how the *operations process* and *intelligence process* nest. (3-1)
- Discusses the *plan and direct* step. (3-3)

- Modifies the *collect* step to the *collect and process* step, and includes a new figure depicting the revision of the intelligence process. (3-5)
- Discusses the *produce* step. (3-6)
- Discusses the *disseminate* step. (3-6)
- Discusses the *analyze* continuing activity. (3-8)
- Discusses the *assess* continuing activity. (3-8)

Chapter 4 discusses the key capabilities by which the intelligence warfighting function facilitates situational understanding and supports decision making. The intelligence warfighting function executes the intelligence process by employing intelligence capabilities. These key capabilities (building blocks) are all-source intelligence and single-source intelligence. Single-source intelligence comprises the intelligence disciplines, complementary intelligence capabilities, and PED capabilities.

This chapter—

- Updates the discussion of *all-source intelligence* and introduces *identity activities* as an all-source effort. (4-1)
- Updates the discussion of the *intelligence disciplines.* (4-2)
- Updates the discussion of the *complementary intelligence capabilities.* (4-10)
- Replaces the discussion of *PED* with new material found in chapter 2. (2-5)
- Discusses *intelligence PED capabilities* that support information collection. (4-12)

Chapter 5 culminates this publication with an important discussion of fighting for intelligence. Intelligence is never perfect, information collection is never easy, and a single collection capability is never persistent and accurate enough to provide all of the answers. The fluid and chaotic nature of large-scale combat operations will cause the greatest degree of fog, friction, and stress on the intelligence warfighting function. Units must be prepared to fight for intelligence against enemy formations, a range of sophisticated threat capabilities, and many unknown conditions within the operational environment.

This chapter—

- Discusses *fighting for intelligence* during large-scale combat operations, with emphasis on the intelligence challenge. (5-1)
- Updates the description of the *commander's role in intelligence,* including *intelligence and the integrating processes and continuing activities.* (5-2)
- Discusses *planning considerations* and *information requirements* to support the defense and offense, reconnaissance, security operations, and deep operations. (5-4)
- Discusses unique aspects of *developing a flexible information collection plan* and *establishing an effective intelligence architecture.* (5-8)
- Updates the discussion on the continuous nature of information collection. (5-9)

NEW, RESCINDED, AND MODIFIED TERMS

ADP 2-0 becomes the proponent of one Army term, introduces two new Army terms, and modifies three Army terms. (See introductory table 1.)

Introductory table 1. New and modified Army terms

Term	*Remarks*
human intelligence	ADP 2-0 becomes the proponent.
intelligence enterprise	Replaced by national to tactical intelligence.
intelligence processing, exploitation, and dissemination	Modified description.
intelligence operations	Modified definition.
intelligence reach	Modified definition.
intelligence synchronization	Modified definition.
processing, exploitation, and dissemination	New term.

Notes. This publication uses the term *commander's critical information requirements and other requirements* when referring to information collection activities. When referring to the intelligence warfighting function or intelligence analysis, the more specific term, *priority intelligence requirements and other requirements* applies.

Acronyms are introduced at their first use in the front matter of this publication (preface and introduction), and again in the body of the publication (chapters 1 through 5).

ADP 2-0 introduces G-*X* and S-*X* (such as G-2 and S-2) acronyms at their first use without defining them as it hinders readability. Definitions for these acronyms can be found in the glossary of this publication.

Chapter 1

Operations and Intelligence

Throughout modern history, intelligence has been and remains an inherent part of military operations. From national and Department of Defense (DOD) levels down to the Army battalion level, intelligence is an activity that never stops. Army forces are globally engaged, always executing operations and preparing for future operations as part of a joint team. A key part of global engagement is the continuous use of intelligence, the collection and analysis of information, and the production of intelligence. This constant activity, referred to as intelligence, is never at rest. To understand Army intelligence, it is important to understand intelligence within the larger context of large-scale combat operations, the operational environment, unified action, the Army strategic roles, and unified land operations.

> ***Intelligence***
>
> Intelligence is (1) the product resulting from the collection, processing, integration, evaluation, analysis, and interpretation of available information concerning foreign nations, hostile or potentially hostile forces or elements, or areas of actual or potential operations; (2) the activities that result in the product; and (3) the organizations engaged in such activities (JP 2-0).

LARGE-SCALE COMBAT OPERATIONS

1-1. Threats to United States (U.S.) interests worldwide are countered by the U.S. forces' ability to respond to a variety of challenges along a conflict continuum that spans from peace to war as shown in figure 1-1. U.S. forces conduct a range of military operations to respond to these challenges. The conflict continuum does not proceed smoothly from stable peace to general war and back.

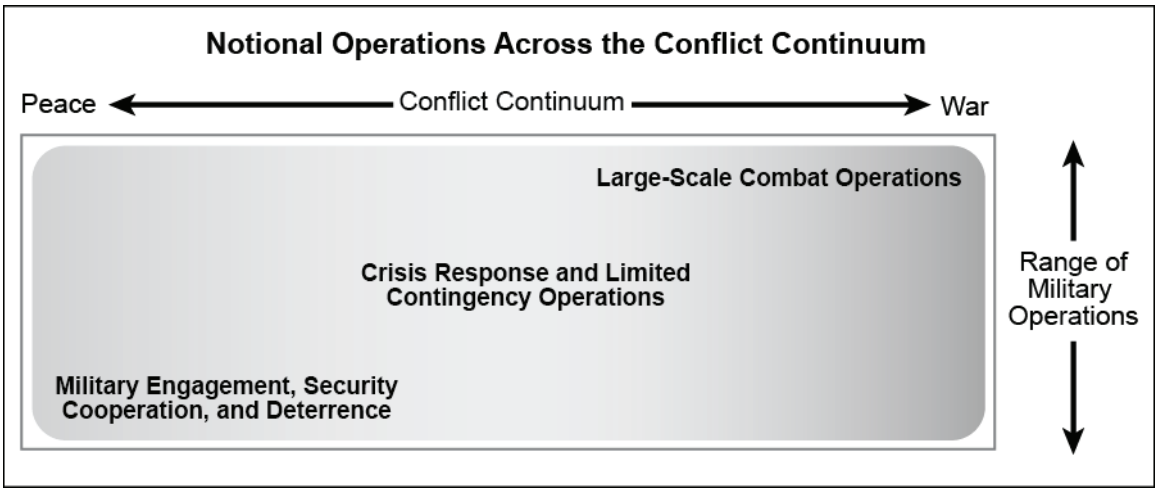

Figure 1-1. The conflict continuum and the range of military operations

1-2. The range of military operations is a fundamental construct that helps relate military activities and operations in scope and purpose within a backdrop of the conflict continuum. All operations along this range share a common fundamental purpose—to achieve or contribute to national objectives. Military engagement, security cooperation, and deterrence activities build networks and relationships with partners, shape regions, keep day-to-day tensions between nations or groups below the threshold of armed conflict, and maintain U.S. global influence. Typically, crisis response and limited contingency operations are focused in scope and scale and conducted to achieve a specific strategic- or operational-level objective in an operational area. Large-scale combat operations are at the far right of the conflict continuum and associated with war. These operations occur in the form of major operations and campaigns aimed at defeating an enemy's armed forces and military capabilities to support national objectives.

1-3. While the Army must be manned, equipped, and trained to operate across the range of military operations, large-scale combat operations present the greatest challenge for Army forces. Large-scale combat operations are intense, lethal, and brutal. Their conditions include complexity, chaos, fear, violence, fatigue, and uncertainty. Future battlefields will include noncombatants, and they will be crowded in and around large and densely populated cities. Enemies will employ a combination of conventional tactics, terrorism, criminal activity, and information warfare to complicate operations. To an ever-increasing degree, activities in the information environment are inseparable from land operations. Large-scale combat operations entail significant operational risk, synchronization, capabilities convergence, and a high operational tempo. These characteristics present a significant challenge for intelligence as a warfighting function. (See FM 3-0 for a more information about large-scale combat operations.)

THE OPERATIONAL ENVIRONMENT

1-4. An *operational environment* is a composite of the conditions, circumstances, and influences that affect the employment of capabilities and bear on the decisions of the commander (JP 3-0). Commanders at all levels have their own operational environment for their particular operation. An operational environment for a specific operation comprises more than the interacting variables that exist within a specific physical area. It also involves interconnected influences (for example, politics and economics)—globally or regionally—that impact the conditions and operations within that physical area. Thus, each commander's operational environment is part of a higher commander's operational environment.

1-5. An operational environment is complex and dynamic and consists of many relationships and interactions among interrelated variables. Today's information technology makes the information environment, which includes cyberspace and the electromagnetic spectrum (EMS), indispensable to military operations. The information environment is a key part of any operational environment and will remain congested and contested simultaneously during operations. All groups in the information environment—enemy, friendly, or neutral—remain vulnerable to attack by physical, psychological, cyber, or electronic means. Each complex aspect of the operational environment makes intelligence support that much more complex. (See FM 3-12 for more information on cyberspace operations and the EMS.)

OPERATIONAL AND MISSION VARIABLES

1-6. Analysis of the broad aspects of an operational environment in terms of the operational variables provides relevant information that senior commanders use to understand, visualize, and describe the operational environment. The operational variables are political, military, economic, social, information, infrastructure, physical environment, and time (PMESII-PT). Upon receipt of a warning order or mission, Army leaders filter relevant information and narrow their focus to six mission variables—mission, enemy, terrain and weather, troops and support available, time available, and civil considerations (METT-TC). Extensive analysis of the operational and mission variables involves significant intelligence support as intelligence often provides the critical context and cultural understanding necessary to support staff planning and facilitate situational understanding.

Terrain

1-7. Terrain aspects and weather conditions are inseparable, directly influence each other, and impact military operations based on the mission variables (METT-TC). Terrain analysis, also referred to as

geospatial analysis, involves the study and interpretation of an area's natural and man-made features, their effects on military operations, and the effects of weather and climate on these features. Terrain analysis is a continuous process. The staff geospatial engineer normally analyzes the military aspects of terrain, which include the collection, analysis, evaluation, and interpretation of geospatial information on the terrain's natural and man-made features. Analysts combine other relevant factors with the terrain and weather to predict their effects on military operations. (For more information, see ATP 2-01.3.)

Weather

1-8. Weather analysis is more than just generating weather forecasts. Weather analysis focuses on detailed assessments of weather effects on friendly and threat operations and various systems. Analysts evaluate the effects of each military aspect of weather and focus on the aspects that have the most bearing on operations and decision making. The evaluation of each aspect should begin with operational climatology and current weather forecasts. Analysts fine-tune the evaluation to determine effects based on specific weather sensitivity thresholds for friendly and threat forces and systems. (For more information, see ATP 2-01.3.)

Civil Considerations

1-9. As part of generating intelligence knowledge before receipt of mission, the staff can database and describe civil considerations using the joint systems perspective (see JP 3-0), the operational variables (PMESII-PT), or the ASCOPE (areas, structures, capabilities, organizations, people, and events) characteristics. However, after the receipt of the mission, Army forces use ASCOPE characteristics as part of the mission variables (METT-TC) during intelligence preparation of the battlefield (IPB). The staff and intelligence analysts leverage information from many different sources, including publicly available information, to provide predictive, specific intelligence on ASCOPE characteristics that are significant to the mission. Lower echelon intelligence staffs may have to depend on higher echelon organizations, such as the Defense Intelligence Agency, to provide detailed information and analysis pertaining to civil considerations and sociocultural factors during some types of operations. (For more on ASCOPE and IPB, see ATP 2-01.3.)

MULTI-DOMAIN EXTENDED BATTLEFIELD

1-10. The interrelationship of the air, land, maritime, space, and cyberspace domains, the information environment, and the EMS requires cross-domain situational understanding of the operational environment. Commanders and staffs must understand the friendly and enemy capabilities and vulnerabilities that reside in each domain. From this understanding, commanders can better identify windows of opportunity during operations to converge capabilities for the best effects. Since many capabilities are not organic to Army forces, commanders and staffs plan, coordinate for, and integrate joint and other unified action partner capabilities in a multi-domain approach to operations. Intelligence plays an important role in facilitating situational understanding across all domains. This type of intelligence effort requires time, significant intelligence capabilities, and an analytical focus.

1-11. Since the Army conducts operations across all domains and the information environment, a multi-domain approach to operations is neither new to the Army nor to national to tactical intelligence. Rapid and continued advances in technologies and the military's use of new technologies within the space domain, the EMS, and the information environment (particularly cyberspace) will drive new requirements for special considerations for intelligence, planning, and converging effects from across all domains.

TRENDS

1-12. Several trends will continue to affect future operational environments. The competition for resources, water access, declining birthrates in traditionally allied nations, and disenfranchised groups in many nations contribute to the likelihood of future conflict. Populations will continue to migrate across borders and to urban areas in search of the employment and services urban areas offer. The adversarial use of media platforms to disperse misinformation and propaganda and malign narratives enables adversaries to shape operational environments to their advantage and ferment dissention, unrest, violence, or at the very least, uncertainty.

THREATS AND HAZARDS

1-13. Although threats are a fundamental part of an operational environment for any operation, they are discussed separately here for emphasis; hazard is an important related term that also affects operations:

- A *threat* is any combination of actors, entities, or forces that have the capability and intent to harm United States forces, United States national interests, or the homeland (ADRP 3-0). Threats may include individuals, groups of individuals (organized or not organized), paramilitary or military forces, nation-states, or national alliances. In general, a threat can be categorized as an enemy or an adversary.
- An *enemy* is a party identified as hostile against which the use of force is authorized (ADRP 3-0).
- An *adversary* is a party acknowledged as potentially hostile to a friendly party and against which the use of force may be envisaged (JP 3-0).
- A *hazard* is a condition with the potential to cause injury, illness, or death of personnel; damage to or loss of equipment or property; or mission degradation (JP 3-33).

1-14. While ADRP 3-0 addresses various threats across the range of military operations, FM 3-0 focuses on peer threats in large-scale combat operations. A peer threat is an adversary or enemy with capabilities and capacity to oppose U.S. forces across multiple domains worldwide or in a specific region where they enjoy a position of relative advantage. Peer threats possess roughly equal combat power in geographical proximity to a conflict area with U.S. forces. A peer threat may also have a cultural affinity to specific regions, providing them relative advantages in terms of time, space, and sanctuary. Peer threats generate tactical, operational, and strategic challenges that are an order of magnitude more challenging militarily than those the Army has faced since the end of the Cold War.

1-15. Peer threats employ their resources across multiple domains to attack U.S. vulnerabilities. They use their capabilities to create lethal and nonlethal effects throughout an operational environment. During combat operations, threats seek to inflict significant damage across multiple domains in a short period of time. They seek to delay friendly forces long enough to achieve their goals and end hostilities before friendly forces reach culmination. Peer threats will use various methods to employ their national elements of power to render U.S. military power irrelevant. Five broad peer threat methods, often used in combination, are—

- **Information warfare:** The threat's orchestrated use of information activities (such as cyberspace operations, electronic warfare (EW), and psychological operations) to gain advantage in the information environment.
- **Preclusion:** The threat's use of a wide variety of capabilities to preclude a friendly force's ability to shape the operational environment and mass and sustain combat power. Antiaccess and area denial are two such activities.
- **Isolation:** The threat's containment of a friendly force so the friendly force cannot accomplish its mission. Peer threats will attempt to isolate U.S. forces in several ways. For example, the threat might prevent a friendly force from effectively communicating while also decisively fixing a friendly unit with long-range fires and close combat capabilities.
- **Sanctuary:** The threat's ability to put its forces beyond the reach of friendly forces. It is a form of protection derived by some combination of political, legal, and physical boundaries that restrict freedom of action by a friendly force commander.
- **Systems warfare:** The threat's analysis of the operational environment (including its forces and friendly forces) to identify specific friendly critical capabilities for disruption or destruction in order to cause failure of a larger friendly system.

1-16. The intelligence warfighting function analyzes nation-states, organizations, people, or groups to determine their ability to damage or destroy life, vital resources, and institutions, or to prevent mission accomplishment. Threats are sometimes categorized as traditional, irregular, disruptive, and catastrophic. While helpful in generally describing the nature of the threat, these categories do not precisely describe the threat's goals, organizations, and methods of operating.

1-17. Intelligence provides a deep understanding of the threat and how the threat can affect mission accomplishment, which is essential to conducting operations. Commanders and staffs must understand how current and potential threats organize, equip, train, employ, and control their forces. Therefore, the

intelligence warfighting function must continually identify, monitor, and assess threats as they adapt and change over time. (For more information on threats and hazards see ADRP 3-0 and FM 3-0.)

UNIFIED ACTION AND JOINT OPERATIONS

1-18. *Unified action* is the synchronization, coordination, and/or integration of the activities of governmental and nongovernmental entities with military operations to achieve unity of effort (JP 1). *Unified action partners* are those military forces, governmental and nongovernmental organizations, and elements of the private sector with whom Army forces plan, coordinate, synchronize, and integrate during the conduct of operations (ADRP 3-0). Army contributions to unified action are called unified land operations (see paragraph 1-26). (For more information, see ADRP 3-0.)

1-19. Intelligence is inherently joint, interagency, intergovernmental, and multinational; it flows up and down through the echelons to provide the most complete, timely, accurate, and detailed intelligence possible. The Army provides adaptable intelligence capabilities that are dedicated to both joint and Army forces operating as a part of the joint team. This intelligence effort is synchronized, networked, and includes collaboration with unified action partners to achieve unity of effort and to meet the commander's intent. Intelligence unity of effort is critical to accomplish the mission. Multinational and interagency partners provide unique capabilities that reinforce and complement Army intelligence capabilities, as well as invaluable cultural awareness and different perspectives on the operational environment. Using the appropriate procedures, foreign disclosure guidance, and established policy, Army intelligence leaders provide information and intelligence support to multinational forces against an array of threats across multiple domains.

1-20. *Joint operations* are military actions conducted by joint forces and those Service forces employed in specific command relationships with each other, which of themselves, do not establish joint forces (JP 3-0). Traditionally, campaigns are the most extensive joint operations. In terms of large-scale combat operations, a campaign is a series of related major operations achieving strategic and operational objectives within a given time and space. A major operation is a series of tactical actions, such as battles, engagements, and strikes and it is the primary building block of a campaign. Army forces conduct supporting operations as part of a joint campaign.

1-21. Most joint operations share certain activities or actions in common. There are six general groups of military activities that typically occur in preparation for and during a large-scale combat operation. These six groups are shape, deter, seize initiative, dominate, stabilize, and enable civil authorities. These six general groups of activities provide a basis for thinking about a joint operation in notional phases. These phases often overlap, and they are not necessarily sequential.

1-22. As a part of joint operations, the Army is the dominant fighting force in the land domain. Across the globe, mission-tailored Army units build partnerships, deter adversaries, and overcome challenges to defeat enemies using simultaneous actions integrated in time, space, and purpose. Army forces both depend on and enable joint forces across all domains and the information environment. This mutual interdependence creates powerful synergies and reflects that all operations have multi-domain components. The Army depends on the other Services for strategic and operational mobility, joint fires, and other key enabling capabilities like information collection in the deep area. The Army supports other Services, combatant commands, and unified action partners with ground-based indirect fires and ballistic missile defense, defensive cyberspace operations, electronic protection, communications, intelligence, rotary-wing aircraft, logistics, and engineering.

1-23. Joint and Army intelligence staffs, units, and organizations within the theater intelligence architecture operate as mutually supporting entities that ensure information and intelligence are shared across echelons to support commanders at all levels. Intelligence, surveillance, and reconnaissance is an important construct in both joint and Army intelligence. Consistent with joint doctrine, *intelligence, surveillance, and reconnaissance* is an integrated operations and intelligence activity that synchronizes and integrates the planning and operation of sensors, assets, and processing, exploitation, and dissemination systems in direct support of current and future operations (JP 2-01). The Army continually executes intelligence, surveillance, and reconnaissance worldwide through the operations and intelligence processes (with an emphasis on intelligence analysis and leveraging intelligence at each echelon) and information collection.

THE ARMY'S STRATEGIC ROLES

1-24. The Army's primary mission is to organize, train, and equip its forces to conduct prompt and sustained land combat to defeat enemy ground forces and seize, occupy, and defend land areas. The Army accomplishes its missions by supporting the joint force through the Army's four strategic roles: shape operational environments, prevent conflict, prevail in large-scale ground combat, and consolidate gains. The strategic roles clarify the enduring reasons for which the Army is organized, trained, and equipped. Figure 1-2 shows the Army's strategic roles in a general relationship to the joint phasing model.

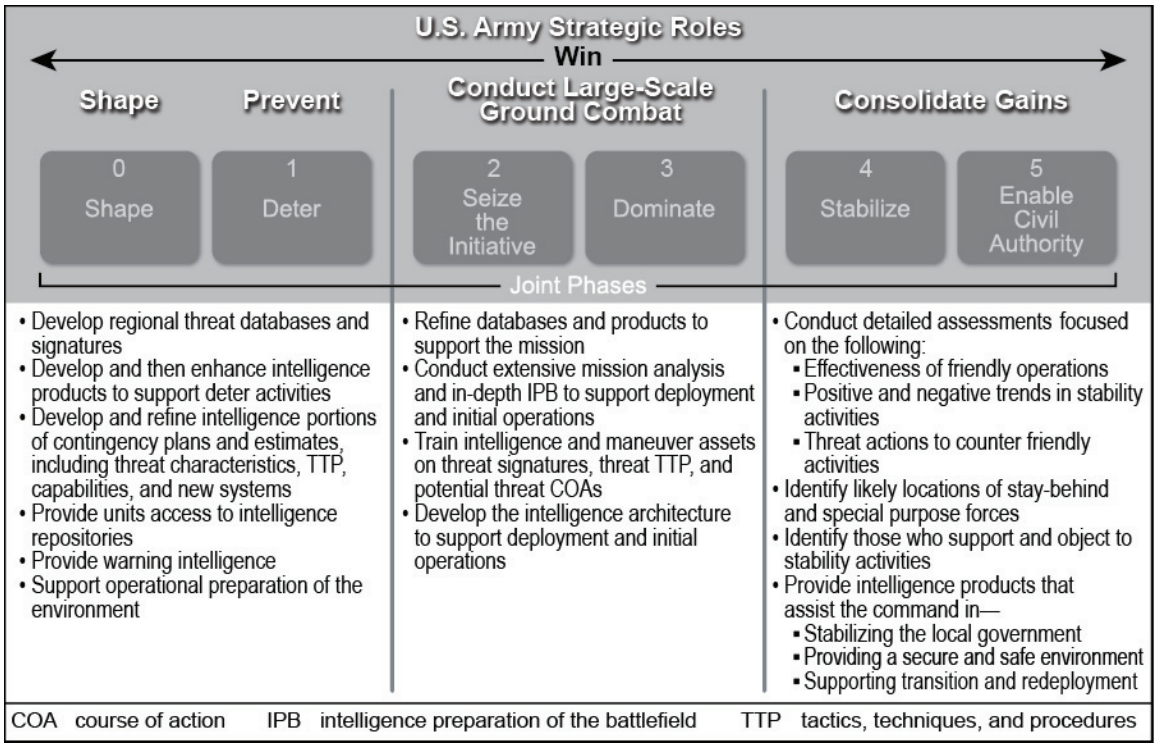

Figure 1-2. The Army's strategic roles and their relationship to the joint phases

1-25. There are requirements for intelligence during each strategic role. Some intelligence activities are specific to certain strategic roles, while others span multiple roles. (See figure 1-2 for some of the most important intelligence tasks for each strategic role.) Commanders and leaders ensure adequate planning for; collection; storage; processing, exploitation, and dissemination (PED); and analysis of information and intelligence during each strategic role. Ideally, regionally aligned forces build on and enhance existing threat data, information, and intelligence during the shaping activities. However, during the shape role, there may be instances in which regionally aligned forces must develop and populate an authoritative database of threat signatures and associated contextual information, in conjunction with joint forces and the Defense Intelligence Agency. This allows units to access, maintain, populate, and continually update the database throughout all subsequent activities. Commands prepare to establish localized intelligence databases during all activities. It is critical for commands to update the intelligence database continually with actual and potential adversaries to maximize the value of intelligence products and reports.

UNIFIED LAND OPERATIONS

1-26. An *operation* is a sequence of tactical actions with a common purpose of unifying theme (JP 1). Army forces, as part of the joint and multinational force, contribute to the joint mission through the conduct of unified land operations. Unified land operations is the Army's operational concept and contribution to unified action; it is how the Army applies combat power. *Unified land operations* are simultaneous offensive, defensive, and stability or defense support of civil authorities tasks to seize, retain, and exploit the initiative to shape the operational environment, prevent conflict, consolidate gains, and win our Nation's wars as part

of unified action (ADRP 3-0). The goal of unified land operations is to establish conditions that achieve the joint force commander's end state by applying landpower as part of a unified action to defeat the enemy. Military forces seek to prevent or deter threats through unified action, and, when necessary, execute operations to defeat aggression.

1-27. Land operations, particularly large-scale combat operations, focus on destroying or dislocating enemy forces or securing key land objectives that reduce the enemy's ability to conduct operations. Five characteristics distinguish land operations: scope, duration, terrain, permanence, and civilian presence. The characteristics of land operations contribute to the complexity and uncertainty of the environment in which Army forces conduct operations. Land operations against a peer threat (highly adaptive and technologically advanced) are especially challenging. At the beginning of a conflict, peer threats often occupy a position that greatly complicates Army forces' ability to conduct operations.

1-28. Peer threats are developing the capability to mass effects across multiple domains at a speed that will impact ongoing operations. They will most likely attempt to deny U.S. and multinational forces access to their territory. Once Army forces achieve access, the threat will attempt to deny them freedom of maneuver. Future adversaries are likely to use offensive cyberspace operations and counter-space measures to deny and degrade U.S. forces' maneuver, communications, intelligence collection, and targeting capabilities. Land-based threats will impede joint force freedom of movement and action across all domains and the information environment.

DECISIVE ACTION

1-29. Within unified land operations, Army forces conduct decisive action. *Decisive action* is the continuous, simultaneous combinations of offensive, defensive, and stability or defense support of civil authorities tasks (ADRP 3-0). In unified land operations, commanders seek to seize, retain, and exploit the initiative while synchronizing their actions to achieve the best effects possible. Operations conducted outside the United States and its territories simultaneously combine three elements—offense, defense, and stability. Within the United States and its territories, decisive action combines the elements of defense support of civil authorities (DSCA) and, as required, offense and defense to support homeland defense. (See table 1-1 on page 1-8.)

1-30. Commanders and staffs at all levels synchronize intelligence with the other warfighting functions to maximize their ability to visualize the operational environment and disrupt the threat simultaneously throughout the area of operations (AO) or perform the necessary stability tasks to consolidate gains. Collecting the intelligence required is often more complex and requires leveraging national to tactical intelligence capabilities. Commanders must be more involved in and knowledgeable of the intelligence warfighting function due to the complexity of operations. The following list provides some basic aspects of intelligence (discussed in more detail in subsequent chapters):

- The Army recognizes the function of intelligence as an element of combat power through the designation of the intelligence warfighting function.
- Intelligence is requirement-driven, and the commander drives intelligence primarily through clear, feasible, and focused requirements.
- The collection of information to support the production of intelligence is called information collection.
- There are many different intelligence analytical tasks such as generate intelligence knowledge, IPB, situation development, and intelligence support to targeting and information operations.
- The general intelligence capabilities employed by the commander and staff are: intelligence analysis elements, PED elements, and military intelligence (MI) units. These general capabilities consist of specific collectors or platforms with specific technical capabilities or sensors.

1-31. It is critical for the intelligence staff to support the commander's ability to visualize threats and relevant aspects of the operational environment during the conduct of decisive operations. However, information requirements, information collection tactics and techniques, the theater intelligence architecture, the nature of intelligence analysis, the employment of MI units, and specific tactics and techniques differ significantly depending on the specific decisive action task.

Table 1-1. Decisive action

Offense	*Defense*
Tasks:	**Tasks:**
• Movement to contact • Attack • Exploitation • Pursuit	• Mobile defense • Area defense • Retrograde
Purposes:	**Purposes:**
• Dislocate, isolate, disrupt, and destroy enemy forces • Seize key terrain • Deprive the enemy of resources • Refine intelligence • Deceive and divert the enemy • Provide a secure environment for stability tasks	• Deter or defeat enemy offense • Gain time • Achieve economy of force • Retain key terrain • Protect the population, critical assets, and infrastructure • Refine intelligence
Stability	***Defense support of civil authorities***
Tasks:	**Tasks:**
• Establish civil security • Establish civil control • Restore essential services • Support to governance • Support to economic and infrastructure development • Conduct security cooperation	• Provide support to domestic disasters • Provide support for domestic, chemical, biological, radiological, and nuclear incidents • Provide support for domestic civilian law enforcement agencies • Provide other designated support
Purposes:	**Purposes:**
• Provide a secure environment • Secure land areas • Meet the critical needs of the population • Gain support for host-nation government • Shape the environment for interagency and host-nation success • Promote security, build partner capacity, and provide access • Refine intelligence	• Save lives • Restore essential services • Maintain or restore law and order • Protect infrastructure and property • Support maintenance or restoration of local government • Shape the environment for intergovernmental success

Offense

1-33. An *offensive task* is a task conducted to defeat and destroy enemy forces and seize terrain, resources, and population centers (ADRP 3-0). Offensive tasks impose the commander's will on the enemy. The offense is the most direct means of seizing, retaining, and exploiting the initiative to gain a physical and psychological advantage. In the offense, the decisive operation is a sudden action directed toward enemy vulnerabilities and capitalizing on speed, surprise, and shock. If that operation fails to destroy the enemy, operations continue until enemy forces are defeated. Executing offensive tasks compels the enemy to react, creating new or larger vulnerabilities the attacking force can exploit. (See ADRP 3-90 for a detailed discussion of offensive tasks.)

1-34. Offensive tasks at all levels require effective intelligence to assist the commander in avoiding the threat's main strength and to deceive and surprise the threat. The entire staff, led by the intelligence staff, develops IPB products to assist the commander in identifying all aspects in the area of interest that can affect mission accomplishment within all domains. The IPB process is collaborative and requires information from all staff elements and some subordinate units that use IPB results and products for planning.

1-35. The intelligence staff supports the commander's use of information collection assets to visualize the terrain, determine threat strengths and dispositions, and confirm or deny threat courses of action (COAs). These assets also collect information concerning the civil considerations within the AO. The G-2/S-2 and G-3/S-3, in coordination with the rest of the staff, develop a synchronized and integrated information collection plan that satisfies the commander's information requirements.

Defense

1-36. A *defensive task* is a task conducted to defeat an enemy attack, gain time, economize forces, and develop conditions favorable for offensive or stability tasks (ADRP 3-0). Normally, the defense cannot achieve a decisive victory. However, it sets conditions for a counteroffensive or a counterattack that enables forces to regain the initiative. Defensive tasks are a counter to an enemy offensive action. They defeat attacks, destroying as much of the attacking enemy as possible. They also preserve control over land, resources, and populations. The purpose of defensive tasks is to retain key terrain, guard populations, protect lines of communications, and protect critical capabilities against enemy attacks. Commanders can conduct defensive tasks to gain time and economize forces so offensive tasks can be executed elsewhere. (See ADRP 3-90 for a detailed discussion of defensive tasks.)

1-37. The intelligence staff supports the commander's use of information collection assets to visualize the terrain, determine threat strengths and dispositions, and confirm or deny threat COAs. Defending commanders can then decide where to arrange their forces in an economy-of-force role to defend and shape the battlefield. Intelligence analysis assists commanders in deciding on the precise time and place to counterattack. The G-2/S-2 and G-3/S-3, in coordination with the rest of the staff, develop a synchronized and integrated information collection plan that satisfies the commander's information requirements.

Stability

1-38. *Stability tasks* are tasks conducted as part of operations outside the United States in coordination with other instruments of national power to maintain or reestablish a safe and secure environment and provide essential governmental services, emergency infrastructure reconstruction, and humanitarian relief (ADRP 3-07). These tasks support governance, whether it is imposed by a host nation, an interim government, or a military government. Stability tasks involve coercive and constructive actions. They assist in establishing or maintaining a safe and secure environment and facilitate reconciliation among local or regional adversaries. Therefore, diverse and detailed intelligence products are important to support stability tasks.

1-39. For stability tasks, commanders often require more detailed intelligence and IPB products to determine how best to conduct operations and influence the local populace to enhance stability. The identification and analysis of threats, terrain and weather, and civil considerations are critical in determining the most effective missions, tasks, and locations to conduct stability tasks. A lack of knowledge concerning insurgents, local politics, customs, culture, and how to differentiate between local combatants often leads to U.S. actions that can result in unintended and disadvantageous consequences. Consequences can include attacking unsuitable targets or offending or causing mistrust among the local population. This lack of knowledge could potentially threaten mission accomplishment. The G-2/S-2 and G-3/S-3, in coordination with the rest of the staff, develop a synchronized and integrated information collection plan that satisfies the commander's information requirements. (For more information on stability tasks, see ADP 3-07 and ADRP 3-07.)

Defense Support of Civil Authorities

1-40. *Defense support of civil authorities* is support provided by United States Federal military forces, Department of Defense civilians, Department of Defense contract personnel, Department of Defense component assets, and National Guard forces (when the Secretary of Defense, in coordination with the governors of the affected states, elects and requests to use those forces in Title 32, United States Code, status) in response to requests for assistance from civil authorities for domestic emergencies, law enforcement support, and other domestic activities, or from qualifying entities for special events (DODD 3025.18).

1-41. DSCA is a task executed in the homeland and U.S. territories. It is conducted to support another primary agency, lead federal agency, or local authority. When DCSA is authorized, it consists of four tasks (see table 1-1 on page 1-8). (See DODD 3025.18 for the full name and discussion of each task.) National Guard forces—Title 32 or state active forces under the command and control of the governor and adjutant general—are usually the first forces to respond on behalf of state authorities. When Federal military forces are employed for DCSA activities, they remain under Federal military command and control at all times. (See JP 3-28 and ADRP 3-28 for detailed DSCA discussions.)

1-42. The concepts and basic processes used to produce intelligence to support decision making for DSCA are no different from those used during offensive, defensive, and stability tasks. However, the operational environment is significantly different, and all commanders must ensure intelligence support in DSCA remains within the guidelines of U.S. law and applicable policies.

1-43. Following DODM 5240.01, for procedures 1 through 10; DOD 5240.1-R, procedures 11 through 15; and AR 381-10 procedures ensures adherence to regulations, statutes, and laws concerning intelligence activities. In particular, intelligence operations must adhere to regulations and directives that implement restrictions in compliance with intelligence oversight requirements. Further, any use of intelligence capabilities for purposes other than those designated in the Chairman, Joint Chiefs of Staff Standing DSCA Execute Order must be expressly approved by the Secretary of Defense. Information collection conducted to support the commander focuses on saving lives and reducing risk to Army forces. Commanders and intelligence professionals consult with staff judge advocates concerning any unclear areas of intelligence activities.

1-44. The intelligence process, some information collection units and systems, and intelligence analysis may assist in supporting the four DSCA core tasks. Army National Guard activities in Title 32, United States Code (USC), status and Regular Army and Army Reserve intelligence activities in Title 10, USC, status can perform intelligence tasks that support DSCA. (See ATP 2-91.7 for more information.)

INTELLIGENCE SUPPORT WITHIN MULTI-DOMAIN OPERATIONS

1-45. Army operations and battles will invariably involve challenges across multiple domains. All Army operations are multi-domain operations and all battles are multi-domain battles. Examples of Army multi-domain operations and activities include airborne and air assault operations, air and missile defense, fires, aviation, cyberspace electromagnetic activities, information operations, space operations, military deception, and information collection. Key considerations for operating in multiple domains are—

- Mission command.
- Reconnaissance in depth.
- Mobility.
- Cross-domain fires.
- Tempo and convergence of effects.
- Protection.
- Sustainment.
- Information operations.
- Cyberspace electromagnetic activities.

1-46. Army forces may be required to conduct operations across multiple domains to gain freedom of action for other members of the joint force. This is similar to other members of the joint force operating across multiple domains to assist in providing land forces with positions of relative advantage. Examples of these operations include neutralizing enemy integrated air defenses, destroying long-range surface-to-surface fires systems, denying enemy access to an AO, disrupting enemy command and control, protecting friendly networks, conducting tactical deception, or disrupting an enemy's ability to conduct information warfare.

1-47. Every echelon is affected by the multi-domain extended battlefield; each should consider time, geography, decision making, the EMS, and the other domains differently. However, not every echelon is able to effectively conduct operations across multiple domains. Brigade combat teams (BCTs) and lower echelons focused on fighting in the close area generally lack the time and ability to effectively plan and employ multi-domain capabilities other than those already under their control. These echelons focus on fundamental operational aspects such as mobility, lethality, and protection. The division is the first echelon able to effectively plan and coordinate for the employment of all multi-domain capabilities across the operational framework (including the considerations—physical, temporal, virtual, cognitive). Theater army and corps echelons have a broader perspective, better focus, and far more capabilities to orchestrate and converge multi-domain activities and operations in time and space. Through these activities and operations, intelligence is critical in assisting friendly forces to effectively identify and exploit windows of opportunity across the

domains to create and exploit temporary windows of superiority. (See FM 3-0 for more information on the multi-domain extended battlefield and operational framework.)

1-48. These operations require a significant amount of detailed intelligence to facilitate the commander's visualization of the threat, threat capabilities, and relevant aspects of the operational environment in time and space. This intelligence support assists commanders and staffs in deciding when and where to concentrate sufficient combat power to defeat the threat while mitigating risk.

This page intentionally left blank.

Chapter 2
Intelligence Support

Army intelligence as a function supports operations by accomplishing various intelligence tasks and activities for commanders and staffs. To provide this support, the intelligence staff, augmented with an analysis element and capabilities, performs intelligence analysis to support the commander and mission command, including the staff integrating processes. MI units collect information from across the operational environment and in each domain and the information environment. The results from this information collection effort provide information for analysis and production into intelligence. This intelligence support occurs at each echelon, from theater army down to the battalion level, within an overarching national to tactical intelligence architecture. Together with the commander, staff, and all units, this functional system is known as the Army intelligence warfighting function.

THE PURPOSE OF INTELLIGENCE

2-1. Intelligence is a product, a process, and a function that enables the Army to conduct operations by supporting the commander and mission command (which is accomplished by supporting the rest of the staff). Commanders and staffs rely on many different types of intelligence products. The intelligence process is continuous and directly supports the operations process by developing information requirements, collecting on those requirements, processing data into information, analyzing information and intelligence from all sources, producing intelligence, and when necessary, developing the situation through operations. Intelligence is also a complex function.

2-2. Intelligence supports commanders (and in some cases other decision makers) and staffs by providing situational understanding of the threat, terrain and weather, civil considerations, and other aspects of the operational environment. Intelligence supports the commander and staff with analysis and production of effective timely, relevant, accurate, and predictive assessments and products tailored to the commander's and staff's specific needs.

2-3. Intelligence drives operations and operations enable intelligence; this relationship is continuous. Intelligence supports the planning, preparing, execution, and assessment of operations by supporting mission command. The mission command warfighting function integrates the elements of combat power across the warfighting functions. To ensure effective intelligence support, commanders and staffs must understand the interrelationship of mission command, the intelligence warfighting function, and fundamental intelligence doctrine. (See ADRP 6-0.)

2-4. Commanders require intelligence about the threat and other aspects of the operational environment before and during operations to effectively accomplish their missions. Intelligence assists commanders in visualizing the operational environment, organizing their forces, and controlling operations to achieve their objectives by answering specific requirements focused in time and space. These intelligence products enable commanders to make decisions based on all available information, identify and assess potential COAs, plan operations, properly direct their forces, and employ ethical, effective, and efficient tactics and techniques. Additionally, intelligence supports protection by alerting commanders to threats and assisting in preserving and protecting the force.

2-5. Supporting mission command and the staff integrating functions is complex. Operations, targeting, intelligence, and communications are inextricably linked. Therefore, the commander must drive the operations process partially by enabling the intelligence warfighting function. Commanders use their staff to synchronize intelligence with the other warfighting functions to visualize the operations and disrupt the threat simultaneously throughout an AO. Successful intelligence is the result of carefully developed requirements, staff integration and synchronization, continuous information collection, and, when necessary, the willingness to fight for intelligence.

2-6. Intelligence leaders (both in the intelligence staff and in MI units) ensure that the intelligence warfighting function operates effectively and efficiently. They are the commander's primary advisors on information requirements, intelligence analysis, employing information collection assets, and fighting for intelligence. Intelligence analysis is a thorough and deliberate process. Intelligence leaders provide the commander with predictive assessments that consider all aspects of the threat, terrain and weather, and civil considerations, and should provide the commander with an estimate about the degree of confidence the intelligence leader places on each analytic assessment.

THE INTELLIGENCE WARFIGHTING FUNCTION

2-7. The intelligence warfighting function is the Army's contribution to the joint intelligence effort. The *intelligence warfighting function* is the related tasks and systems that facilitate understanding the enemy, terrain, weather, civil considerations, and other significant aspects of the operational environment (ADRP 3-0). Specifically, other significant aspects of the operational environment include threats, adversaries, the operational variables, and can include other aspects depending on the nature of operations.

2-8. The intelligence warfighting function encompasses more than the MI branch:

- The commander drives the operations process and focuses the intelligence effort that supports it.
- Intelligence is commander-centric. The commander performs the central role within intelligence and enables the intelligence warfighting function.
- The entire staff is important to the intelligence warfighting function and each staff member contributes to intelligence in a different way.
- During combat operations, the G-2/S-2, G-3/S-3, G-6/S-6, and fire support coordinator form the staff core that is essential to synchronize and integrate intelligence.
- Every Soldier contributes to information collection.

INTELLIGENCE WARFIGHTING FUNCTION TASKS

2-9. The intelligence warfighting function facilitates support to the commander and staff through a broad range of supporting Army Universal Task List (AUTL) tasks. (See ADRP 1-03.) These tasks are interrelated, require the participation of the commander and staff, and are often conducted simultaneously. The intelligence warfighting function tasks facilitate the commander's visualization and understanding of the threat and other relevant aspects of the operational environment. Army units at the Army Service component command (ASCC) level or formed as a joint task force use the Universal Joint Task List (also called UJTL). The intelligence warfighting function includes the following tasks:

- **Provide intelligence support to force generation**—the task of generating intelligence knowledge concerning an operational environment, facilitating future intelligence operations, and tailoring the force.
- **Provide support to situational understanding**—the task of providing information and intelligence to commanders to assist them in achieving a clear understanding of the force's current state with relation to the threat and other relevant aspects of the operational environment.
- **Conduct information collection**—the task that synchronizes and integrates the planning and employment of sensors and assets as well as the PED systems in direct support of current and future operations.
- **Provide intelligence support to targeting and information operations**—the task of providing the commander information and intelligence support for targeting to achieve lethal and nonlethal effects.

2-10. Table 2-1 illustrates how the intelligence warfighting function tasks support the commander. (See ADRP 1-03 for the complete list of tasks and their measures of performance.)

Table 2-1. Overview of intelligence warfighting function tasks

Intelligence tasks ►	*Commander's focus ►*	*Commander's decisions*
Provide intelligence support to force generation: • Provide intelligence readiness. • Establish an intelligence architecture. • Provide intelligence overwatch. • Generate intelligence knowledge. • Tailor the intelligence force.	Orient on contingencies.	• Should the unit's level of readiness be increased? • Should the operation plan be implemented?
Provide support to situational understanding: • Perform IPB. • Perform situation development. • ~~Provide intelligence support to protection.~~ • Provide tactical intelligence overwatch. • Conduct police intelligence operations. • Provide intelligence support to civil affairs operations.	• Plan an operation. • Prepare. • Execute. • Assess. • Secure the force. • Determine 2d and 3d order effects on operations and the populace.	• Which COA will be implemented? • Which enemy actions are expected? • What mitigation strategies should be developed and implemented to reduce the potential impact of operations on the population?
Conduct information collection: • Collection management. • Direct information collection. • Execute collection. • Conduct intelligence-related missions and operations.	• Plan information collection for an operation, including PED requirements. • Prepare. • Execute. • Assess.	• Which DPs, HPTs, and HVTs are linked to the threat's actions? • Are the assets available and in position to collect on the DPs, HPTs, and HVTs? • Have the assets been repositioned for branches or sequels?
Provide intelligence support to targeting and information operations: • Provide intelligence support to targeting. • Provide intelligence support to information operations. • Provide intelligence support to combat assessment.	• Create lethal or nonlethal effects against targets. • Destroy, suppress, disrupt, or neutralize targets. • Reposition intelligence or attack assets.	• Are the unit's lethal and nonlethal actions and maneuver effective? • Which targets should be re-engaged? • Are the unit's information operations effective?

COA	course of action	HVT	high-value target
DP	decision point	IPB	intelligence preparation of the battlefield
HPT	high-payoff target	PED	processing, exploitation, and dissemination

2-11. There are intelligence-related AUTL tasks beyond the four most significant intelligence warfighting tasks in table 2-1. Soldiers, systems, and units from all branches conduct intelligence-related AUTL tasks. Every Soldier, as a part of a small unit, is a potential information collector. Soldiers develop a special awareness simply due to exposure to events occurring in the AO, and they can collect and report information based on their observations and interactions with the local population. The increased awareness that Soldiers develop through personal contact and observation is a critical element of the unit's ability to understand the operational environment more fully.

2-12. Therefore, the Army established the *every Soldier is a sensor* (known as ES2) program, which is accomplished through information collection operations among populations. The AUTL task to establish a mission intelligence briefing and debriefing program is designed to assist units in collecting useful information in their AO more effectively. This task is critical because units often operate in an AO characterized by violence, uncertainty, and complex threats. (See ATP 3-55.4.)

2-13. Commanders, staffs, and subordinates ensure their decisions and actions comply with applicable U.S., international, and, in some cases, host-nation laws and regulations. Commanders at all levels ensure their Soldiers operate in accordance with the law of war and the rules of engagement. (See the DOD Law of War Manual and CJCSI 3121.01B [classified].) In some cases, there are certain sensitivities, ethical considerations, and limitations to personnel conducting information collection—for example, civil affairs and medical Soldiers. Medical personnel cannot be assigned information collection tasks due to their Geneva Convention category status. If medical personnel do gain information through casual observation of activities

in plain sight while conducting their duties, they will report the information to their chain of command. In all cases, Army professionals base their decisions and actions on the moral principles of the Army Ethic, ensuring the protection of the inalienable rights of all people.

INTELLIGENCE CORE COMPETENCIES

2-14. The intelligence core competencies are the most basic activities and tasks the Army uses to describe and drive the intelligence warfighting function and leverage national to tactical intelligence. At the most basic level, the intelligence warfighting function makes observations about the threat and relevant aspects of the operational environment through **collection** resulting in data that it **processes and exploits** into useable information for **analysis and production**. This results in intelligence. Because of the complexity of this undertaking, the entire effort must be **synchronized** carefully. The four aspects (in bold) capture the intelligence core competencies. Commanders and staffs must thoroughly understand the core competencies to apply the intelligence process and leverage national to tactical intelligence. The intelligence core competencies are—

- Intelligence synchronization (**synchronized**).
- Intelligence operations (**collection**).
- Intelligence PED (**processes and exploits**).
- Intelligence analysis (**analysis and production**).

2-15. The intelligence core competencies also serve as those areas that all MI units and Soldiers must continuously train on to maintain a high degree of proficiency. Intelligence professionals have unique technical training, intelligence oversight, and other oversight requirements in order to operate as part of the DOD intelligence effort. MI Soldiers must continuously and rigorously train to thoroughly understand unique authorities and guidelines, terms, and technical channel procedures.

Intelligence Synchronization

2-16. ***Intelligence synchronization*** **is the art of integrating information collection; intelligence processing, exploitation, and dissemination; and intelligence analysis with operations to effectively and efficiently fight for intelligence in support of decision making.** This core competency ensures the intelligence warfighting function supports mission command. Intelligence synchronization balances time with collection, production, required accuracy, and specificity to meet the commander's intent and other requirements.

2-17. Intelligence synchronization requires an effective relationship with the commander, focused information collection, effective dissemination of predictive assessments, and adaptability to changing situations. Some critical aspects of effective intelligence synchronization include—

- Early and continuous teamwork with the commander and across the staff.
- Expertise and proficiency in information collection, PED, and leveraging national to tactical intelligence.
- Mastery of the intelligence process.
- A collaborative environment for flexible, creative analysts to solve complex problems.

Intelligence Operations

2-18. Intelligence operations is one of the four primary means for information collection. The other three are reconnaissance, surveillance, and security operations. ***Intelligence operations*** **are the tasks undertaken by military intelligence units through the intelligence disciplines to obtain information to satisfy validated requirements.** These requirements are normally specified in the information collection plan. Intelligence operations collect information about the intent, activities, and capabilities of threats and relevant aspects of the operational environment to support commanders' decision making.

2-19. Intelligence operations, like reconnaissance, surveillance, and security operations, are shaping operations used by the commander for decisive action. MI units use the operations process to conduct intelligence operations. Intelligence operations are conducted using mission orders and standard command and support relationships. Flexibility and adaptability to changing situations are critical for conducting

effective intelligence operations. To plan and then remain flexible and adaptable, MI units and the intelligence staff must carefully deconflict and coordinate intelligence operations.

2-20. Deconfliction and coordination require a series of related activities that facilitate operations in another unit's AO. These activities facilitate successful intelligence operations and fratricide avoidance. At a minimum, MI units coordinate for and report their presence and request information on any conditions or ongoing situations that may affect how they conduct their mission. When possible, MI units and the intelligence staff should conduct a thorough face-to-face coordination.

2-21. MI units must also coordinate with the appropriate staff elements to establish fire support coordination measures around information collection assets, airspace control measures, and the appropriate weapons control status (in reference to aerial information collection assets). Failure to conduct proper deconfliction and coordination may result in mission failure or unnecessary risk to personnel. MI units' leadership also coordinates with the supported unit's intelligence section for debriefings of returning members, convoy leaders, and others.

2-22. Intelligence coordination is also conducted by the intelligence staff to facilitate active collaboration, laterally and vertically. It includes establishing and maintaining technical channels to direct, refine, and focus intelligence operations. (See paragraphs 4-11 through 4-13 and FM 2-0 for more on technical channels.)

Intelligence Processing, Exploitation, and Dissemination

2-23. Army doctrine has long recognized the functions of processing, initial analysis, and reporting, and the requirement for providing combat information. Joint and Army doctrine currently recognizes these functions under the concept of PED and the core capability of intelligence PED. In joint doctrine, PED is an intelligence concept that facilitates the allocation of assets to support intelligence operations. Under the joint PED concept, planners examine all collection assets and determine if allocation of additional personnel and resources is required to exploit the collected information.

2-24. Beyond doctrine, PED plays an important role in the development of DOD intelligence capabilities. PED began as processing and intelligence exploitation support for unique systems and capabilities—for example, full motion video from unmanned aircraft systems. Unlike previous geospatial intelligence (GEOINT) collection capabilities, full motion video did not have an automated capability to process raw data into a useable format and supporting personnel to perform initial exploitation. Therefore, a separate PED capability was required. Since 2006, PED requirements across multiple disciplines have grown significantly, and DOD has created many different PED capabilities across various echelons.

2-25. ***Processing, exploitation, and dissemination*** **is the execution of the related functions that converts and refines collected data into usable information, distributes the information for further analysis, and, when appropriate, provides combat information to commanders and staffs**. PED is not exclusive to MI organizations; other branches employ sensor collection capabilities. Therefore, PED conducted by intelligence personnel or units is called *intelligence PED*. Intelligence PED facilitates efficient use and distribution of information following collection. In essence, intelligence PED is the way the intelligence warfighting function processes collected data and information, performs an initial analysis (exploitation), and provides information in a useable form for further analysis. During intelligence PED, some information will be identified as combat information. In those cases, the combat information will be disseminated to commanders and staffs.

2-26. An important part of intelligence PED is ensuring information is distributed with adequate context and formatted to facilitate understanding or make subsequent analysis easier. Another important aspect of PED is providing feedback on the effectiveness of collection relative to the information collection plan and expected results. All PED methods are related closely to planning, information collection, control via technical channels, and intelligence analysis and production requirements. Receiving feedback gives leaders and staffs the information needed to maintain synchronization of intelligence operations with the overall operation. This synchronization may include retasking MI collection assets or cueing other MI collection capabilities.

2-27. The current approach to intelligence PED reflects a deliberate solution to the increased complexity of intelligence operations and the explosion of available data and information resulting from information collection. This approach is part of meeting the enduring challenge to get the right information to the right

place at the right time. The amount of available data and information will continue to grow exponentially. In response, the Army is emphasizing PED resourcing, planning, and execution, and maintaining a continuous assessment of its usefulness. This approach is resourced with and executed by a variety of intelligence PED capabilities leveraged throughout the Army and intelligence community.

Intelligence Analysis

2-28. Analysis is the basis for planning and staff activities. Analysis facilitates commanders' and other decision makers' ability to visualize the operational environment, organize their forces, and control operations in order to achieve their objectives.

2-29. Intelligence analysis is specific to the intelligence warfighting function and results in the production of timely, accurate, relevant, and predictive intelligence. ***Intelligence analysis*** **is the process by which collected information is evaluated and integrated with existing information to facilitate intelligence production**. The purpose of intelligence analysis is to describe the current—and attempt to proactively assess—threats, terrain and weather, and civil considerations. Intelligence analysis sets the stage for the development of information collection requirements, which result in information collection and then more intelligence analysis; this relationship is continuous. (See ATP 2-33.4 for more on intelligence analysis.)

2-30. Intelligence analysis is continuous, complements intelligence synchronization, and enables operations. Some aspects that enable effective staff support and intelligence analysis include—

- **Critical thinking.** Critical thinking is essential to analysis. Using critical thinking, which is disciplined and self-reflective, provides more holistic, logical, ethical, and unbiased analysis and conclusions. Applying critical thinking ensures analysts fully account for the elements of thought, the standards of thought, and the traits of a critical thinker.
- **Embracing ambiguity.** Well-trained analysts are critical due to the nature of changing threats and operational environments. They must embrace ambiguity, and recognize and mitigate their own or others' biases, challenge their assumptions, and continually learn during analysis.
- **Collaboration.** Commanders, intelligence and other staffs, and intelligence analysts collaborate. They actively share and question information, perceptions, and ideas to better understand situations and produce intelligence. Collaboration is essential to analysis; it ensures analysts work together to effectively and efficiently achieve a common goal. Often analytical collaboration is enabled by DOD intelligence capabilities.

NATIONAL TO TACTICAL INTELLIGENCE

2-31. National to tactical intelligence comprises all U.S. intelligence professionals, sensors, systems, federated organizations, information, and processes supported by a network-enabled architecture. While there are many aspects to national to tactical intelligence, the most important element of the intelligence effort is the people that make it work. The intelligence warfighting function is the Army's contribution to national intelligence.

2-32. The value of the national to tactical intelligence effort is the ability it provides to leverage information from all unified action partners, including access to national capabilities, as well as nonintelligence information, larger volumes of information and intelligence, and specialized analysis by unified action partners. Collaboration is the central principle of conducting analysis. Army units provide accurate and detailed intelligence on the threats and relevant aspects of the operational environment (especially those related to Army activities), while other portions of the DOD intelligence effort provide expertise and access not readily available to the Army. Additionally, DOD agencies provide governance over certain intelligence methods and activities. Cooperation benefits everyone.

2-33. Analysts leverage higher-level intelligence organizations to create a more comprehensive and detailed assessment of threats and relevant aspects of the operational environment (such as the multi-domain extended battlefield, civil considerations, and sociocultural factors) to facilitate mission command. An example of achieving greater efficiency between the intelligence and mission command warfighting functions is the creation of fusion centers. Fusion centers are ad hoc cells designed to enable targeting, facilitate current or future operations, and inform decision making. (See FM 2-0 for more information on fusion centers.)

2-34. The effectiveness of the intelligence warfighting function hinges directly on collaboration and unity of effort within the intelligence community. Numerous DOD and non-DOD agencies and organizations in the intelligence community support Army operations by providing specific intelligence products and services. The intelligence community has become increasingly important as new technologies facilitate collaborative analysis and production. DOD members include the Defense Intelligence Agency, National Security Agency, National Geospatial-Intelligence Agency, National Reconnaissance Office, and Army, Navy, Air Force, and Marine Corps Intelligence. Non-DOD members include the Central Intelligence Agency, Department of State, Department of Energy, Federal Bureau of Investigation, Department of the Treasury, U.S. Coast Guard Intelligence, Department of Homeland Security, the Drug Enforcement Administration, and the Office of Director of National Intelligence. Intelligence community members establish standards in their respective specialties. Effective intelligence staffs are familiar with these organizations and the methods of obtaining information from them as necessary. (See JP 2-0.)

Note. *Intelligence community* is all departments or agencies of a government that are concerned with intelligence activity, either in an oversight, managerial, support, or participatory role (JP 2-0).

NATIONAL AND JOINT INTELLIGENCE

2-35. National intelligence organizations employ specialized resources and dedicated personnel to collect intelligence worldwide about trends, threats and threat capabilities, events and activities, and other national intelligence requirements. National intelligence organizations primarily support national decision makers, while also routinely providing support to the joint force commander. However, depending on the situation, the focus of this national-level intelligence collection and production may meet some Army service needs.

2-36. The United States Army Intelligence and Security Command (INSCOM) is a direct reporting unit to the Army Deputy Chief of Staff for Intelligence, who conducts and synchronizes worldwide intelligence collection across all disciplines and all-source analysis activities. The Army, in response to validated requirements, may provide the theater and joint force with intelligence capabilities resident within INSCOM. INSCOM also delivers linguist support and intelligence-related advanced skills training, acquisition support, logistics, communications, and other specialized capabilities to support Army, joint, unified action partners, and the U.S. intelligence community.

2-37. There are two types of units assigned to INSCOM: military intelligence brigades-theater (MIB-Ts) and functional commands. There are seven MIB-Ts, each one tailored for the combatant command it supports. These brigades provide collection, processing, analysis, and dissemination support to the ASCCs, combatant commanders, and the intelligence community. INSCOM MIB-Ts are assigned through the appropriate joint documentation process to geographic combatant commands (GCCs). GCCs routinely provide these brigades in an operational control relationship to the supporting ASCCs.

2-38. INSCOM's functional brigades and groups may provide general support, general support reinforcing, or direct support to theaters of operations through intelligence reach, or they may be force tailored for deployment to support the joint force. These brigades and groups, while not regionally aligned, work in coordination with INSCOM's MIB-Ts to effectively create a seamlessly integrated tactical to national intelligence architecture. Functional commands within INSCOM have missions and capabilities focused on a single discipline or operational function. Examples of this type of command include the—

- 902d MI Group (counterintelligence [CI]).
- Army GEOINT Battalion.
- Army Operations Group (human intelligence [HUMINT]) operating in direct support of Army requirements.
- 704th MI Brigade providing signals intelligence (SIGINT) functional capabilities to support national and Army requirements.
- 116th Aerial Intelligence Brigade (aerial intelligence, surveillance, and reconnaissance and associated PED) to support combatant command and Army requirements.

- National Ground Intelligence Center (NGIC), which is the Army's service intelligence production center in response to national and Army requirements.
- Army Field Support Center.

REGIONALLY ALIGNED FORCES AND SETTING THE THEATER

2-39. *Regionally aligned forces* are those forces that provide a combatant commander at up to joint task force capable headquarters with scalable, tailorable capabilities to enable the combatant commander to shape the environment. They are those Army units assigned to combatant commands, those Army units allocated to a combatant command, and those Army capabilities distributed and prepared by the Army for combatant command regional missions (FM 3-22). Regionally aligned forces also include capabilities that are Service-retained but aligned with a combatant command. Regional missions include theater security cooperation and other shaping efforts. A large portion of joint and Army intelligence is regionally aligned.

2-40. Regionally aligned forces and other specified Army units require ready access to and seamless interaction with their associated combatant command's intelligence architecture. When an Army headquarters enters a GCC theater as a joint force command, joint task force, or combined joint task force, it primarily receives intelligence support through the joint intelligence architecture. Specifically, the GCC joint intelligence center/joint intelligence operations center (also called JIC/JIOC) provides all-source intelligence support unless another support relationship is established. Other Army units within the GCC depend on the combatant command's MIB-T for situational awareness throughout the area of responsibility. This relationship allows units to tailor mission planning and training, establish an effective intelligence architecture, and leverage DOD intelligence effectively. This concept refers to the MIB-T as the anchor point within that specific theater.

2-41. The intelligence warfighting function must constantly set the theater for all Army forces across all echelons of a deployed force in theater. Intelligence staffs and MI units must carefully transition intelligence capabilities and activities to support all engagements and operations as the Army moves from shape to prevent to prevail in large-scale ground combat and to consolidate gains. There are three core tasks involved in setting the theater:

- The intelligence staff plans, builds, and evolves an intelligence architecture based on the information collection, PED, and analysis capabilities allocated or requested to support operations.
- The intelligence staff builds the knowledge needed to understand the operational environment through coordination and collaboration with regionally aligned forces, using the MIB-T as the anchor point. This task includes connecting the intelligence architecture to and incorporating reports and products into the mission command information systems.
- The intelligence staff supports theater security cooperation and engagements that develop context and build relationships with unified action partners through the successful conduct of intelligence operations, intelligence analysis, and intelligence PED.

ESTABLISHING THE INTELLIGENCE ARCHITECTURE

2-42. The intelligence architecture is the compilation and interrelationship of all relevant intelligence and communications capabilities, data centers, organizations, supporting capabilities, concepts of operations, and personnel necessary to ensure the successful execution of the intelligence process. It connects the units, capabilities, PED activities, and analysts whose products and assessments inform decision makers. The architecture consists of more than a unit's organic intelligence capabilities, systems, and personnel. It includes all elements of the intelligence network and associated communications architectures required to enable intelligence operations to support mission requirements. (See FM 2-0 for more on intelligence units, general capabilities, collectors and platforms, and specific technical capabilities and sensors.)

2-43. Planning the intelligence architecture is inseparable from long-range planning for future intelligence operations. It is tied directly to the types and methods of support the commander directs. It is roughly equivalent to developing a blueprint for a house and gathering the materials to build the house. The unit cannot count on support from intelligence capabilities unless they are included in the intelligence architecture and supported by interoperable communications.

2-44. The intelligence staff portrays the intelligence architecture in a series of planning products that map the operational and technical aspects of the interoperability between the many components of the architecture. The architecture includes but is more encompassing than the different intelligence, communications, and technical networks. (Technical networks are those information management and information system connections that allow sharing of resources and information.) Intelligence architecture products capture not only networks and their technical specifications but also how the elements of the architecture relate and interoperate with each other. These products should address mission tasks, technical control, tipping and cueing, maintenance, security measures, medical evacuation, and force protection, among other considerations. General intelligence collection capabilities are captured in detail, including specific collectors or platforms and their specific technical sensors or capabilities, to avoid gaps in collection capabilities.

2-45. Planning and coordinating the intelligence architecture is critical during all types of operations. When developing the intelligence architecture, the intelligence staff considers all personnel, organizations, systems, and procedures necessary for developing intelligence, including those needed for intelligence operations. The architecture must address bandwidth requirements, preparing for operations, collecting the required information and analyzing it, producing the required products, disseminating the resulting intelligence, and assessing both the intelligence produced and the process that produced it. It is critical for the intelligence staff to work with the commander and the staff as early as possible and throughout planning to ensure the intelligence architecture is addressed adequately. The G-2/S-2 also ensures the unit or organization and its subordinates are adequately integrated into their intelligence architecture to enable effective information collection, PED, and analysis to support mission requirements. This ensures the intelligence architecture supports the necessary operational and technical connections between collection assets, control elements, PED nodes, analytical cells, and headquarters to enable an effective and efficient information flow of intelligence to decision makers and the rest of DOD.

2-46. Effective communications connectivity, automation, and interoperability are essential components of the intelligence architecture. These components are especially difficult to establish during large-scale combat operations when tactical forces will not have fixed sites and a robust communications infrastructure is not in place or are severely impacted by an adversary. Establishing the communications network involves many complex technical issues. The intelligence staff collaborates closely with the signal staff to arrange the required communications links. The intelligence staff requires classified and unclassified network connectivity for its equipment. If elements of the intelligence staff will be working outside the range of the unit's communications systems, intelligence architecture planning must include coordination for global or extended-range capabilities.

INTELLIGENCE ACROSS ARMY ECHELONS

2-47. Army intelligence supports decisive action at all echelons. Specifically, the intelligence warfighting function supports operations from the theater army down to the battalion level. The commander and staff need accurate, relevant, and predictive intelligence to understand threat centers of gravity, goals and objectives, and COAs. The commander and staff must also have detailed knowledge of threat strengths, vulnerabilities, organizations, equipment, capabilities, and tactics to plan for and execute friendly operations. Precise intelligence is critical to target threat capabilities at the right time and place and to open windows of opportunity to achieve positions of relative advantage.

2-48. The basic intelligence support provided by the G-2/S-2 and intelligence staff at each echelon is the same. What differs is the size, composition, and number of supporting capabilities for the intelligence staff; access to higher-level information and intelligence; number and complexity of the requirements; and time available to answer those requirements. In general, the higher the echelon, the greater the volume, depth, and complexity (for example, detailed intelligence products about threat cyberspace activities) of analysis and intelligence production the intelligence staff can perform. Lower-echelon G-2/S-2s and intelligence staffs often must depend on the higher echelon for certain intelligence products and support. Therefore, the commander and staff must understand the intricacies or specifics of the intelligence warfighting function across each echelon.

2-49. MI unit structures and capabilities differ significantly across theaters and echelons. For example—

- Each theater army MIB-T is structured differently and has different capabilities and capacities.
- The corps expeditionary-military intelligence brigade (E-MIB) is the lowest level with organic CI teams and HUMINT units specifically designated for detainee facility interrogations.
- The theater army, corps, and BCT have organic MI units—the MIB-T, E-MIB, and MI company respectively—but the division and battalion do not have an organic MI unit. ***Note.*** Some of the corps E-MIBs can be task-organized to support the division or even some BCTs.

2-50. These aspects of the intelligence warfighting function matter to the success of operations. Figure 2-1 provides a quick summary of the operations, intelligence staffs, and organic MI units at each level. (For more information on the Army echelons, see FM 3-0; for more on intelligence units and capabilities from theater army to the battalion level, see FM 2-0.)

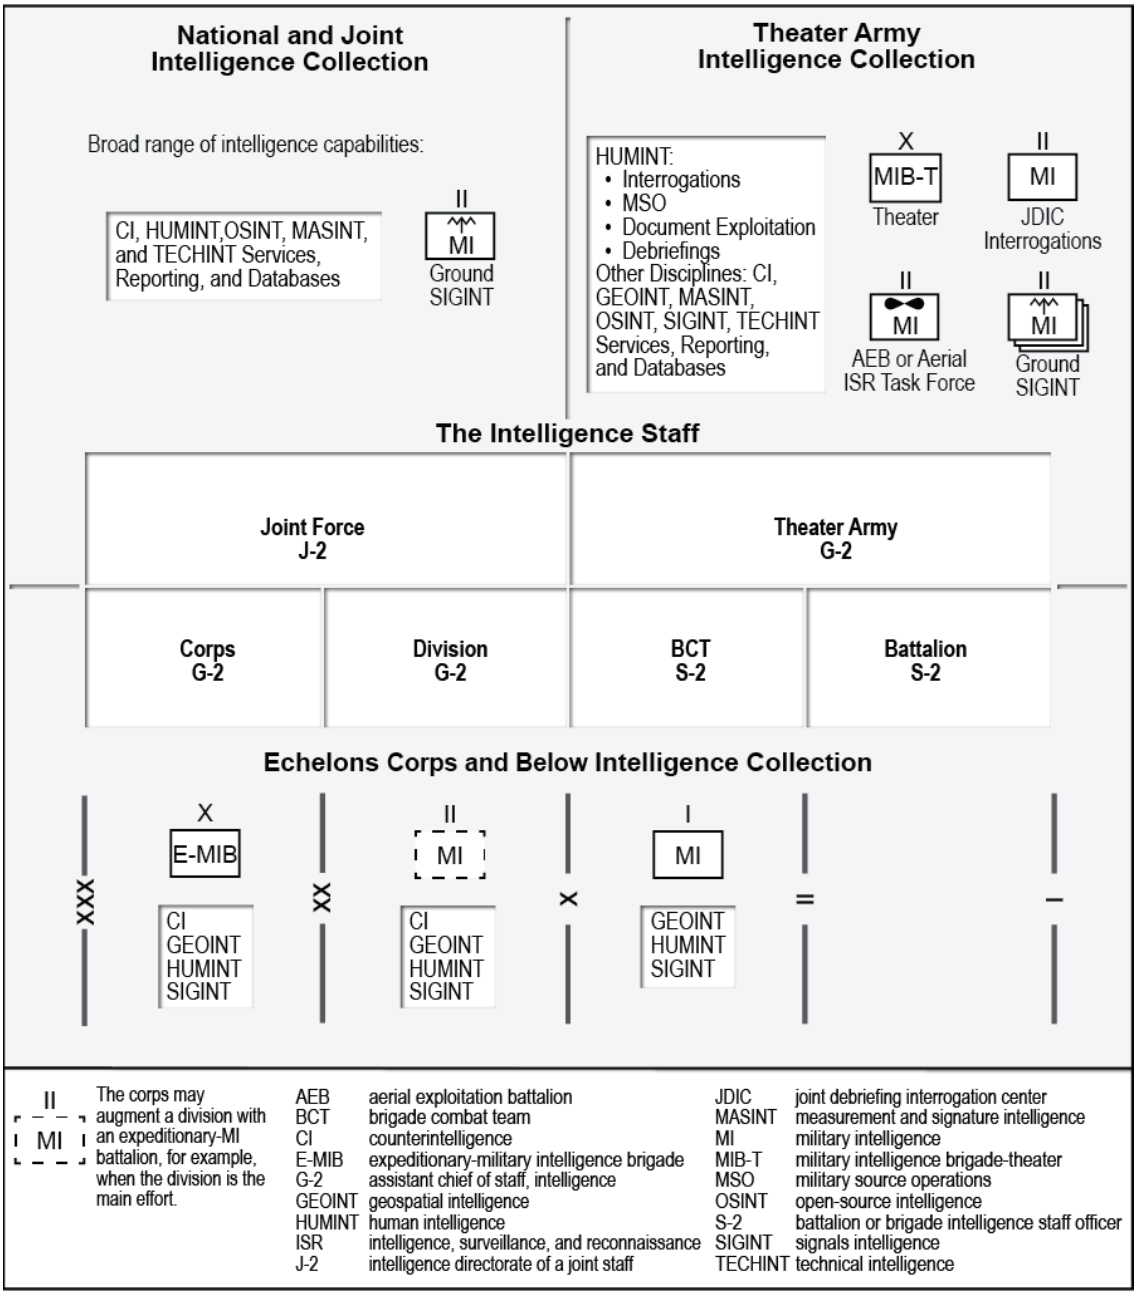

Figure 2-1. Intelligence across the echelons

Chapter 3

The Intelligence Process

The Army views the intelligence process as a model that describes how the intelligence warfighting function facilitates situational understanding and supports decision making. This process provides a common framework for Army professionals to guide their thoughts, discussions, plans, and assessments. Effective execution of the intelligence process depends on commander and staff involvement and effective information collection.

THE OPERATIONS PROCESS AND THE INTELLIGENCE PROCESS

3-1. Commanders use the operations process to drive the planning necessary to understand, visualize, and describe their operational environment; make and articulate decisions; and direct, lead, and assess military operations. Commanders successfully drive the operations process by using information and intelligence. The design and structure of the intelligence process support commanders by providing intelligence needed to support mission command and the commander's situational understanding. The commander provides guidance and focus by defining operational priorities and establishing decision points and commander's critical information requirements (CCIRs).

3-2. The joint intelligence process provides the basis for common intelligence terminology and procedures. (See JP 2-0.) It consists of six interrelated categories of intelligence operations:

- Planning and direction.
- Collection.
- Processing and exploitation.
- Analysis and production.
- Dissemination and integration.
- Evaluation and feedback.

3-3. Due to the unique characteristics of Army operations, the Army intelligence process differs from the joint process in a few subtle ways while accounting for each category of the joint intelligence process. The Army intelligence process consists of four steps (plan and direct, collect and process, produce, and disseminate) and two continuing activities (analyze and assess).

3-4. The commander's guidance drives the intelligence process. This process generates information, products, and knowledge about threats, terrain and weather, and civil considerations for the commander and staff. The intelligence process supports all of the activities of the operations process (plan, prepare, execute, and assess). Although the intelligence process includes unique aspects and activities, it is designed similarly to the operations process:

- The *plan and direct* step of the intelligence process closely corresponds with the *plan* activity of the operations process.
- The *collect and process*, *produce*, and *disseminate* steps of the intelligence process together correspond to the *execute* activity of the operations process.
- *Assess* and *analyze* are continuous. These activities form part of the overall *assessment* activity of the operations process.

3-5. Intelligence support to operations requires leveraging national to tactical intelligence. This support is coordinated through the intelligence staff at each echelon by using the intelligence process. Figure 3-1 on page 3-2 illustrates the intelligence process.

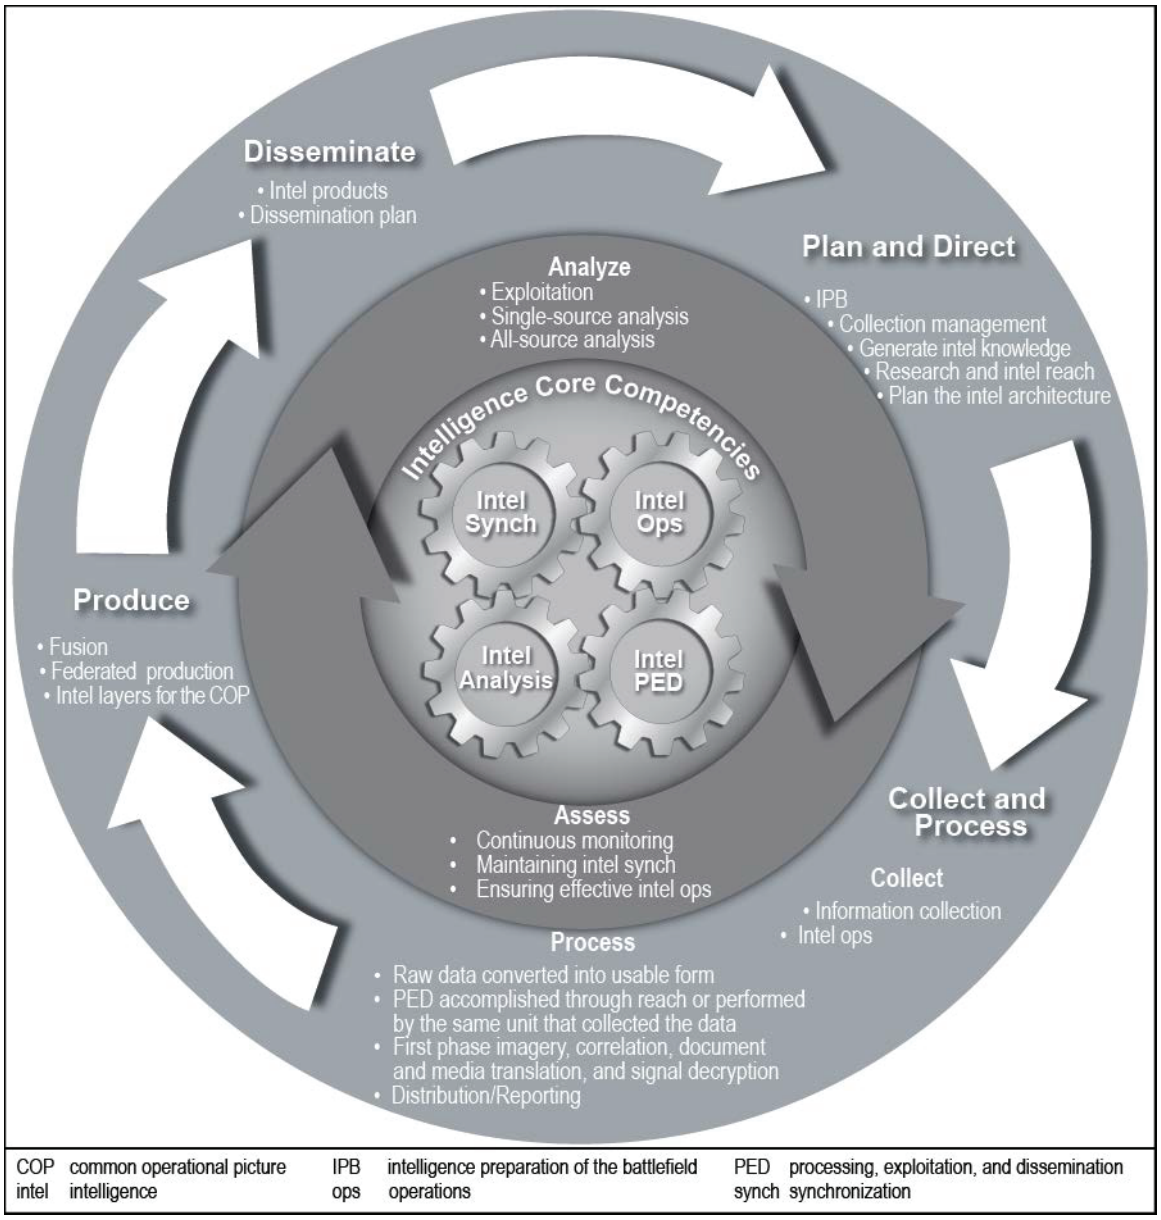

Figure 3-1. The intelligence process

3-6. The G-2/S-2 produces intelligence for the commander as part of a collaborative process. The commander drives the G-2/S-2's intelligence production effort by establishing intelligence and information requirements with clearly defined goals and criteria. Differing unit missions and operational environments dictate numerous and varied production requirements to the G-2/S-2 and staff.

3-7. The G-2/S-2 and staff provide intelligence products that enable the commander to—

- Plan operations and employ maneuver forces effectively.
- Recognize potential COAs.
- Conduct mission preparation.
- Employ effective tactics, techniques, and procedures.
- Take appropriate security measures.
- Focus information collection.
- Conduct effective targeting.

COMMANDER'S GUIDANCE

3-8. Commanders drive the intelligence process by providing commander's guidance and approving priority intelligence requirements (PIRs). While it is not part of the intelligence process, commander's guidance is one of the primary mechanisms used to focus the intelligence process. When approving their PIRs, commanders should limit the number of PIRs so the staff can focus its efforts and allocate sufficient resources. Each commander dictates which intelligence products are required, when they are required, and in what format.

INTELLIGENCE PROCESS STEPS

3-9. The intelligence process leverages all sources of information and expertise, including the intelligence community and nonintelligence entities, to provide situational awareness to the commander and staff. The intelligence warfighting function uses the intelligence process as a management tool to ensure the right information gets to the right users at the right time in a useable format without inundating users. Just as the activities of the operations process overlap and recur as the mission demands, so do the steps of the intelligence process.

3-10. Intelligence activities are enabled by and subject to laws, regulations, and policies to ensure the proper conduct of intelligence operations. While there are too many to list, legal authorities include the USCs, executive orders (EOs), National Security Council and DOD directives, Army regulations, U.S. SIGINT directives, status-of-forces agreements (also called SOFAs), rules of engagement, and other relevant international laws. Commanders will request assistance from their servicing judge advocate to interpret or deconflict these legal authorities.

PLAN AND DIRECT

3-11. Each staff element must conduct analysis before operational planning can begin. Planning consists of two separate but closely related components—conceptual and detailed planning. Conceptual planning involves understanding the operational environment and the problem, determining the operation's end state, and visualizing an operational approach. Detailed planning translates the broad operational approach into a complete and practical plan. (For more information on conceptual and detailed planning, see ADRP 5-0.)

3-12. The initial generation of intelligence knowledge about the operational environment occurs far in advance of detailed planning and orders production. This intelligence assists in focusing information collection once a mission is received or in anticipation of a mission. Commanders and staffs often begin planning in the absence of a complete and approved higher headquarters' operation plan or operation order. In these instances, the headquarters begins a new planning effort based on a warning order and other directives, such as a planning order or an alert order from their higher headquarters.

3-13. Intelligence planning is also an inherent part of the Army design methodology and the military decision-making process. Intelligence analysts must prepare detailed planning products for the commander and staff for orders production and the conduct of operations. Through thorough and accurate planning, the staff allows the commander to focus the unit's combat power to achieve mission success.

3-14. The plan and direct step also includes activities that identify key information requirements and develops the means for satisfying those requirements. The intelligence staff collaborates with the operations and signal staffs to plan the intelligence architecture. Collaboration facilitates parallel planning and enhances all aspects of the intelligence process by enriching analysis, incorporating different points of view, and broadening situational understanding. The staffs produce a synchronized and integrated information collection plan focused on answering PIRs and other requirements. PIRs and other requirements drive the information collection effort.

3-15. Commanders must employ organic collection assets as well as plan, coordinate, and articulate requirements to leverage DOD intelligence capabilities. Commanders and staffs cannot expect higher echelons to automatically provide all of the information and intelligence they need. While intelligence reach is a valuable tool, the push of intelligence products from higher echelons does not relieve subordinate staffs from developing specific and detailed requirements. Commanders and staffs must focus requests for intelligence support by clearly articulating requirements.

3-16. The staff focuses information collection plans on answering CCIRs and other requirements and enables the quick retasking of units and assets as the situation changes. Collection management includes continually identifying intelligence gaps. This ensures the developing threat situation and civil considerations—not only the operation order—drive information collection. Specifically, G-2/S-2s—

- Evaluate information collection assets for suitability (availability, capability, vulnerability, and performance history) to execute information collection tasks and make appropriate recommendations on asset tasking to the primary operations staff officers.
- Assess information collection against CCIRs and other requirements to determine the effectiveness of the information collection plan. They maintain awareness to identify gaps in coverage and identify the need to cue or recommend redirecting information collection assets to the primary operations staff officers.
- Update the collection management tools as requirements are satisfied, added, modified, or deleted. They remove satisfied requirements and recommend new requirements as necessary.

Requirements

3-17. For collection managers, there are three types of requirements resulting from collection management. The following three types of validated information requirements are prioritized for purposes of assigning information collection tasks:

- PIRs.
- Intelligence requirements.
- Information requirements.

3-18. Collection managers must understand how collection and PED assets are distributed as they develop and validate requirements. They must also understand that some requirements can be answered through intelligence reach. Figure 3-2 shows the process of developing requirements and integrating them into the information collection process. (See FM 3-55 and ATP 2-01 for more details on requirements and indicators.)

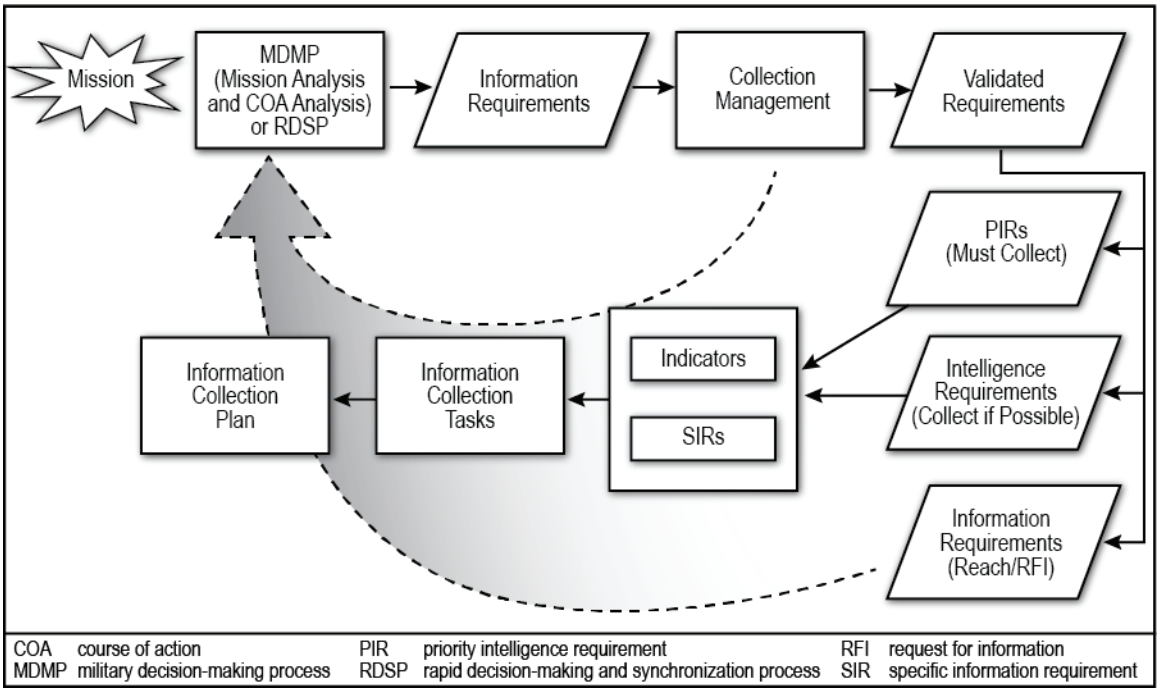

Figure 3-2. Requirements development

Intelligence Reach

3-19. ***Intelligence reach*** **is the activity by which intelligence organizations proactively and rapidly access information from, receive support from, and conduct direct collaboration and information sharing with other units and agencies, both within and outside the area of operations, unconstrained by geographic proximity, echelon, or command**. Information can be acquired through the push and pull of information, databases, homepages, collaborative tools, and broadcast services. Intelligence reach also supports reach PED and distributed analysis. (Reach PED refers to PED capabilities at centralized locations where sensor data is disseminated for intelligence PED support.) Three important aspects of intelligence reach are searches and queries, data mining, and collaboration. (See FM 2-0 for more information on intelligence reach.)

COLLECT AND PROCESS

3-20. The intelligence staff synchronizes collection and processing to provide critical information at key times throughout the phases of an operation. Collection and processing are mutually dependent. Staffs should never allow a seam to emerge between collection and processing, even when elements conducting those functions are separated geographically. The intelligence staff continuously monitors the results not only of information collection but also of processing to continuously assess the effectiveness of the overall information collection effort.

3-21. Information collection and processing activities transition when requirements change, the unit mission changes, the unit proceeds through the phases of an operation, or the unit prepares for future operations. Successful information collection and processing results in timely collection and reporting of relevant and accurate information, which supports the production of intelligence. The intelligence staff coordinates with other unit staffs, subordinate and lateral commands, and higher echelon units to ensure specific units, capabilities, personnel, equipment (especially communications), and procedures are in place.

3-22. *Collection* is, in intelligence usage, the acquisition of information and the provision of this information to processing elements (JP 2-01). Different units and systems collect information and data about threats, terrain and weather, and civil considerations through the four primary means of information collection: reconnaissance, surveillance, security operations, and intelligence operations. Collection includes the maneuver or movement of units and systems to effective locations and the associated force protection measures based on an order or tasking.

3-23. Successfully collecting timely, relevant, and useful information against an adaptive threat is difficult. It is critical for the staff to plan for and use well-developed procedures and flexible planning to track emerging targets, adapt to changing operational requirements, and meet the requirement for combat assessment. A successful collection and processing effort requires the intelligence staff, intelligence analysts, and collectors to form an efficient assessment and feedback loop. Success also requires the staff, analysts, and collectors to watch for threat countermeasures, denial activities, and threat deception. The last step of the feedback loop involves the intelligence staff evaluating reported information for its accuracy and responsiveness to information collection tasks and providing feedback to control elements and collectors.

3-24. Intelligence personnel distribute collected data and information via appropriately classified means and networks for further processing and analysis. During processing, intelligence personnel and systems convert raw data into forms of information commanders, staffs, intelligence analysts, and other consumers can use. Processing may occur immediately within the brain of the data collector, due to the collector's operational knowledge, experience, and situational understanding. However, intelligence personnel and systems often perform processing as a separate but associated function, either at the point of collection or at a separate location.

3-25. Processing includes first-phase imagery exploitation, data conversion and correlation, document and media translation, and signal decryption. For example, processing occurs when the technical parameters (frequency, pulse repetition frequency, and bandwidth) detected by an electronic intelligence (ELINT) collection system are compared and associated with the known parameters of a particular radar system. Rather than providing an analyst with an overwhelming mass of raw ELINT data, the system provides the analyst with the specific type of radar detected.

3-26. Different types of data require different degrees of processing before recipients can understand them. Within SIGINT, processing is increasingly automated and quickly performed by collection systems. Similarly, captured enemy documents may only require translation before an analyst can exploit the information they contain. On the other hand, technical exploitation of an item of enemy equipment may require months of intensive effort to determine its full capabilities. Following established guidelines, analysts must ensure data passes to standardized databases as soon as possible. In some situations, data requires processing to convert it into a format compatible with certain storage means.

3-27. At any point in the intelligence process, intelligence and time-sensitive combat information that affect the current operation are disseminated immediately upon recognition. *Combat information* is unevaluated data, gathered by or provided directly to the tactical commander which, due to its highly perishable nature or the criticality of the situation, cannot be processed into tactical intelligence in time to satisfy the user's tactical intelligence requirements (JP 2-01). The routing of combat information proceeds immediately in two directions—directly to the commander and through routine reporting channels for use by intelligence analysis and production elements.

3-28. Generally, intelligence PED capabilities execute processing for intelligence operations. Intelligence PED involves performing initial analysis to provide context, passing the information on for further analysis or reporting of combat information, and providing feedback on the effectiveness of the collection effort. These closely related PED functions are an inherent part of the collection effort. By performing them faster, more efficiently, and more accurately, intelligence personnel improve the entire intelligence process.

PRODUCE

3-29. Production is the development of intelligence through the analysis of collected information and existing intelligence. Analysts create intelligence products, conclusions, or projections regarding threats and relevant aspects of the operational environment to answer known or anticipated requirements in an effective format. The intelligence staff processes and analyzes information from single or multiple sources, disciplines, and complementary intelligence capabilities, and integrates the information with existing intelligence to create finished intelligence products.

3-30. Intelligence products must be timely, relevant, accurate, predictive, and tailored to facilitate situational understanding and support decision making. The accuracy and detail of intelligence products have a direct effect on operational success. Due to time constraints, analysts sometimes develop intelligence products that are not as detailed as they prefer. However, a timely, accurate answer that meets the commander's requirements is better than a more detailed answer that is late.

3-31. The intelligence staff prioritizes and synchronizes the unit's information processing and intelligence production efforts. The intelligence staff addresses numerous and varied production requirements based on PIRs and other requirements; diverse missions, environments, and situations; and user-format requirements. Through analysis, collaboration, and intelligence reach, the G-2/S-2 and staff use the intelligence capability of higher, lateral, and subordinate echelons to meet processing and production requirements.

3-32. Analysis occurs to ensure the information is relevant, to isolate significant elements of information, and to integrate the information into an intelligence product. Additionally, analysis of information and intelligence is important to ensure the focus, prioritization, and synchronization of the unit's intelligence production effort is in accordance with the PIRs and other requirements.

DISSEMINATE

3-33. Commanders and unified action partners must receive combat information and intelligence products in time and in an appropriate format to facilitate situational understanding and support decision making. Central to the successful dissemination to unified action partners is the early and continuous involvement of the foreign disclosure officer and supporting foreign disclosure representatives. Timely dissemination of intelligence and finished intelligence products is critical to the success of operations. Dissemination is deliberate and ensures consumers receive intelligence to support operations.

3-34. This step does not include the normal reporting and technical channels otherwise conducted by intelligence warfighting function organizations and units during the intelligence process. Each echelon with access to relevant information may perform analysis on that information. Thus, each echelon ensures that resulting intelligence products are properly disseminated. Determining the product format and selecting the means to deliver it are key aspects of dissemination.

3-35. The commander and staff must establish and support a seamless intelligence architecture including an effective dissemination plan. A dissemination plan can be a separate product or integrated into existing products, such as the collection management tools. The plan must include provisions for dissemination to unified action partners.

3-36. Intelligence and communications systems continue to evolve in their sophistication, application of technology, and accessibility to the commander, staff, and unified action partners. Their increasing capabilities also create an unprecedented volume of information available to commanders at all echelons. The commander and staff must have a basic understanding of intelligence dissemination systems and their contribution to the intelligence warfighting function.

Dissemination Methods and Techniques

3-37. There are numerous methods and techniques for disseminating information and intelligence. The appropriate technique in any particular situation depends on many factors, such as capabilities and mission requirements. Information presentation may be in a verbal, written, interactive, or graphic format. The type of information, time allocated, and commander's preferences all influence the information format. Answers to PIRs require direct dissemination to the commander, subordinate commanders, and staff. Direct dissemination is conducted person-to-person, by voice communications, or electronic means. Other dissemination methods and techniques include—

- Direct electronic dissemination (a messaging program).
- Instant messaging.
- Web posting (with notification procedures for users).
- Printing or putting the information on a compact disk and sending it.

3-38. Disseminating intelligence simultaneously to multiple recipients is one of the most effective, efficient, and timely methods, and can be accomplished through various means—for example, push or broadcast.

3-39. G-2/S-2s must plan methods and techniques to disseminate information and intelligence when normal methods and techniques are unavailable. For example, information and intelligence can be disseminated using liaisons or regularly scheduled logistic packages as long as any classified information is properly protected and individuals are issued courier orders.

Dissemination Channels

3-40. Intelligence leaders at all levels assess the dissemination of intelligence and intelligence products. Reports and other intelligence products move along specific channels within the intelligence architecture. The staff assists in streamlining information distribution within these channels by ensuring dissemination of the right information in a timely manner to the right person or element. The three channels through which commanders and their staffs communicate are command channels, staff channels, and technical channels.

Presentation Techniques and Procedures

3-41. Presentation is important and serves as the conclusion of the intelligence process. One of the most difficult challenges within mission command is effectively visualizing the operational environment. The intelligence staff must provide the commander with relevant information that supports the commander's visualization, facilitates situational understanding, and enables decision making. The presentation method is based on the commander's guidance but often requires creative solutions to most effectively and efficiently present the intelligence and other information.

3-42. Presentations can be formal or informal. The three general methods the staff uses to present information are written narrative, verbal narrative, and graphic format. Intelligence systems contain standard report formats, maps, and mapping tools that assist the staff in presenting information. Audio and video systems,

such as large format displays and teleconferencing systems, enable the staff to use a combination of these methods in multimedia presentations.

INTELLIGENCE PROCESS CONTINUING ACTIVITIES

3-43. Analyze and assess are two continuing activities that shape the intelligence process. Analyze and assess form part of the overall assessment activity of the operations process and occur continually throughout the intelligence process.

ANALYZE

3-44. Analysis assists commanders, staffs, and intelligence leaders in framing the problem, stating the problem, and solving it. Leaders at all levels conduct analysis to assist in making many types of decisions. Analysis occurs at various stages throughout the intelligence process and is inherent throughout intelligence support to situational understanding and decision making. Collectors and analysts perform initial analysis—often referred to within intelligence as exploitation during the collect and process step—before reporting or otherwise distributing the information to single and all-source analysis elements. For example, a collector may add context to information (analysis) based on previously acquired experience and knowledge, prior to dissemination.

3-45. Analysis in collection management is critical to ensuring information requirements receive the appropriate priority for collection. The intelligence staff analyzes each requirement to determine—

- The requirement's feasibility and whether it supports the commander's guidance.
- The best method of satisfying the requirement (for example, what unit or capability and where to position that capability).
- If the collected information satisfies the requirement.

3-46. Analysis is used in situation development to determine the significance of collected information and its significance relative to predicted threat COAs and PIRs and other requirements. Through predictive analysis, staffs attempt to identify threat activity or trends that present opportunities or risks to the friendly force. They often use indicators developed for each threat COA as the basis for their analysis and conclusions.

ASSESS

3-47. Assess is part of the overall assessment activity of the operations process. For intelligence purposes, assessment is the continuous monitoring and evaluation of the current situation, particularly significant threat activities and changes in the operational environment. Assessing the situation begins upon receipt of the mission and continues throughout the intelligence process. This assessment allows commanders, staffs, and intelligence leaders to ensure intelligence synchronization. Friendly actions, threat actions, civil considerations, and events in the area of interest interact to form a dynamic operational environment. Continuous assessment of the effects of each element on the others, especially the overall effect of threat actions on friendly operations, is essential to situational understanding.

3-48. The intelligence staff continuously produces assessments based on operations, the information collection effort, the threat situation, and the status of relevant aspects of the operational environment. These assessments are critical to—

- Ensure PIRs are answered.
- Ensure intelligence requirements are met.
- Redirect collection assets to support changing requirements.
- Ensure operations run effectively and efficiently.
- Ensure proper use of information and intelligence.
- Identify threat efforts at deception and denial.

3-49. The intelligence staff continuously assesses the effectiveness of the information collection effort. This type of assessment requires sound judgment and a thorough knowledge of friendly military operations; characteristics of the area of interest; and the threat situation, doctrine, patterns, and projected COAs.

Chapter 4
Army Intelligence Capabilities

The intelligence warfighting function executes the intelligence process by employing intelligence capabilities. All-source intelligence and single-source intelligence are the building blocks by which the intelligence warfighting function facilitates situational understanding and supports decision making. The intelligence warfighting function receives information from a variety of capabilities. Some of these capabilities are commonly referred to as single-source capabilities. Single-source capabilities are employed through intelligence operations with the other means of information collection (reconnaissance, surveillance, and security operations). PED capabilities are also necessary to process information and prepare it for subsequent analysis. The intelligence produced based on all of those capabilities is called all-source intelligence.

ALL-SOURCE INTELLIGENCE

4-1. Army forces conduct operations based on all-source intelligence assessments and products developed by the intelligence staff. ***All-source intelligence*** **is the integration of intelligence and information from all relevant sources in order to analyze situations or conditions that impact operations.** In joint doctrine, *all-source intelligence* is intelligence products and/or organizations and activities that incorporate all sources of information in the production of finished intelligence (JP 2-0).

ALL-SOURCE ANALYSIS

4-2. The fundamentals of all-source intelligence analysis comprise intelligence analysis techniques and the all-source analytical tasks: situation development, generating intelligence knowledge, IPB, and support to targeting and information operations.

4-3. Through the receipt and processing of incoming reports and messages, the intelligence staff determines the significance and reliability of incoming information, integrates incoming information with current intelligence holdings, and through analysis and evaluation determines changes in threat capabilities, vulnerabilities, and probable COAs. The intelligence staff supports the integrating processes (IPB, targeting, and risk management) and continuing activities (information collection) by providing all-source analysis of threats, terrain and weather, and civil considerations.

4-4. All-source intelligence is used to develop the intelligence products necessary to aid situational understanding, support the development of plans and orders, and answer information requirements. Although all-source intelligence normally takes longer to produce, it is more reliable and less susceptible to deception than single-source intelligence.

ALL-SOURCE PRODUCTION

4-5. Fusion facilitates all-source production. For Army purposes, ***fusion*** **is consolidating, combining, and correlating information together**. Fusion occurs as an iterative activity to refine information as an integral part of all-source analysis.

4-6. All-source intelligence production is continuous and occurs throughout the intelligence and operations processes. Most of the products from all-source intelligence are initially developed during planning and updated, as needed, throughout preparation and execution based on information gained from continuous assessment.

ALL-SOURCE AND IDENTITY ACTIVITIES

4-7. Joint doctrine describes identity activities as a collection of functions and actions that appropriately recognize and differentiate one person from another to support decision making. They include the collection of identity attributes and physical materials; their processing and exploitation; all-source analytic efforts, production of identity intelligence and DOD law enforcement criminal intelligence products; and dissemination of those products to inform policy and strategy development, operational planning and assessment, and the appropriate action at the point of encounter. These functions and actions are conducted by maneuver, intelligence, and law enforcement components.

4-8. Within intelligence, identity activities are the responsibility of the personnel within the all-source elements of the intelligence staff. Within all-source, identity activities combine the synchronized application of the complementary intelligence capabilities (biometrics, forensics, and document and media exploitation [DOMEX]) with intelligence and identity management processes. This establishes identity, affiliations, and authorizations in order to deny anonymity to the adversary and protect U.S. and partner nation assets, facilities, and forces. These all-source activities result in the discovery of true identities; link identities to events, locations, and networks; and reveal hostile intent. These outputs enable tasks, missions, and actions that span the range of military operations.

SINGLE-SOURCE INTELLIGENCE

4-9. Single-source intelligence includes the joint intelligence disciplines and complementary intelligence capabilities. Intelligence PED capabilities are a critical aspect of single-source intelligence activities that ensure the results of collection inform single- and all-source analysis. MI units can conduct intelligence operations with a single intelligence discipline or complementary intelligence capability or as a multifunction intelligence operation, which combines activities from two or more intelligence disciplines or complementary intelligence capabilities.

4-10. Information moves throughout various echelons along specific transmission paths or channels. Establishing command and support relationships directs the flow of reported information during intelligence operations. Channels assist in streamlining information dissemination by ensuring the right information passes promptly to the right people. Commanders and staffs normally communicate through three channels: command, staff, and technical. (See ADRP 6-0 and FM 6-02.71.)

TECHNICAL CHANNELS

4-11. Technical channels, while not a command or support relationship, often affect intelligence operations. For intelligence operations, technical channels are the transmission paths between intelligence units (including sections) performing a technical function requiring special expertise. Technical channels control the performance of technical functions. They neither constitute nor bypass command authorities; rather, they serve as the mechanism for ensuring the execution of clearly delineated technical tasks, functions, and capabilities to meet the dynamic requirements of unified land operations.

4-12. Commanders direct operations but often rely on technical expertise to plan, prepare, execute, and assess the unit's collection effort. Technical channels also involve translating information collection tasks into the specific parameters used to focus highly technical or legally sensitive aspects of the information collection effort. Technical channels include but are not limited to—

- Defining, managing, or prescribing specific employment techniques.
- Identifying critical technical collection criteria such as technical indicators.
- Recommending collection techniques, procedures, or assets.
- Conducting operational reviews.
- Conducting operational coordination.
- Conducting specialized intelligence training.

4-13. Through technical channels, commanders and staffs ensure adherence to applicable laws and policies, ensure proper use of doctrinal techniques, and provide technical support and guidance. Applicable laws and policies include all relevant U.S. law, the law of war, international law, DOD directives and instructions, and

orders. For specific intelligence discipline collection, regulatory authority is maintained by national and DOD intelligence agencies and is passed through technical channels. (See FM 2-0 for more on technical channels.)

THE INTELLIGENCE DISCIPLINES

4-14. In joint operations, intelligence collection and activities are commonly organized around the intelligence disciplines, which include—

- CI.
- GEOINT.
- HUMINT.
- Measurement and signature intelligence (MASINT).
- Open-source intelligence (OSINT).
- SIGINT.
- Technical intelligence (TECHINT).

4-15. The intelligence disciplines are integrated to ensure a multidiscipline approach to intelligence analysis, and ultimately, all-source intelligence facilitates situational understanding and supports decision making. Each discipline applies unique aspects of support and guidance through technical channels. (See JP 2-0.)

Counterintelligence

4-16. Army CI counters or neutralizes foreign intelligence collection efforts through collection, CI investigations, operations, analysis, production, and technical services and support. CI includes all actions taken to detect, identify, disrupt, neutralize, or exploit foreign intelligence entity collection efforts directed against DOD and Army personnel, operations, information, material, facilities, technology, and networks. It is the key intelligence community contributor to protecting U.S. interests and equities.

4-17. *Foreign intelligence entity* is any known or suspected foreign organization, person, or group (public, private, or governmental) that conducts intelligence activities to acquire United States information, block or impair United States intelligence collection, influence United States policy, or disrupt United States systems and programs. The term includes foreign intelligence and security services and international terrorists (JP 2-01.2). It also includes insurgents, other adversary intelligence threats, and insider threats targeting or suspected of targeting U.S. forces personnel, operations, facilities, networks, information, and technology for intelligence gathering or planning and preparation for an attack or exploitation. (See ATP 2-22.2-1.)

4-18. The role of Army CI is to conduct aggressive, comprehensive, and coordinated investigations, operations, collection, intelligence PED, analysis and production, and technical services. These functions are conducted worldwide to detect, identify, assess, counter, exploit, or neutralize the foreign intelligence entity collection threat. Army CI has four primary mission areas:

- **Counterespionage.** Counterespionage refers to those CI defensive and offensive endeavors to detect, identify, assess, counter, neutralize, or exploit the foreign intelligence entity threat.
- **CI support to force protection.** While force protection is the responsibility of commanders at all levels, Army CI contributes to protection of the force. CI collection, analysis, investigations, and operations are designed to identify foreign intelligence and international terrorist activities that threaten military personnel, civilian employees, and units. Army CI exercises every available authority to support the force protection plans of Army and supported DOD commanders worldwide in accordance with AR 381-20 (classified), DODM 5240.01 for procedures 1-10, DOD 5240.1-R for procedures 11-15, and AR 381-10. In the performance of this function, CI will collect and report information that satisfies standing CI collection requirements.
- **CI support to research, development, and acquisition.** This support is accomplished to prevent the illegal diversion or loss of critical technology essential to the strategic advantage of the United States in future conflicts.
- **CI-cyber.** CI-cyber refers to the use of techniques and measures to identify, exploit, or neutralize adversary cyberspace espionage that uses the internet, information resources, and digital media as the primary tradecraft methodology.

4-19. CI core functions are interrelated, mutually supporting, and can be derived from one another. No single function can defeat the foreign intelligence entity collection threat. The CI core functions are—

- **Operations.** CI operations are broadly executed CI activities that support a program or specific mission. CI operations use one or more of the CI functions. CI operations can be offensive or defensive, and they are derived from, transitioned to, or used simultaneously—depending on the scope, objective, or continued possibility for operational exploitation.
- **Investigations.** Army CI will conduct aggressive and comprehensive investigations worldwide to detect, identify, assess, and counter, neutralize, or exploit the foreign intelligence entity, foreign and insider threat (as defined in DODI 5240.26) to the Army and DOD whenever such threat is within CI jurisdiction.
- **Collection.** CI collection is the systematic acquisition of information concerning the foreign intelligence entity collection threat. CI elements conduct collection activities to support the overall CI mission. CI collection is conducted by using sources, elicitation, official liaison contacts, debriefings, screenings, and OSINT to obtain information that answers standing CI collection requirements or other collection requirements.
- **Technical services and support.** CI technical services are used to assist the CI core functions of investigations, collections, and operations or to provide specialized technical support to a program or activity. The proliferation of sophisticated collection technology, surveillance, and "eaves-dropping" devices available in commercial markets enable any foreign intelligence entity with the ability to increase its capability and effectiveness.
- **Analysis and production.** CI analysis is used to satisfy the supported commander's intelligence requirements and provide focus and guidance to CI operations. CI analysis and production can be accomplished at any level in which Army CI assets are assigned to support any of the four primary mission areas.

4-20. CI organizations and force structure are designed to support Army forces through scalable team, operations management, and technical channel packages. The CI and HUMINT staff officer (also called G-2X/S-2X) structure supports decentralized CI operations. The establishment of the CI and HUMINT staff element (also called 2X) and the CI coordinating authority throughout the Army ensures a trained and experienced cadre of CI professionals to support operations. (See ATP 2-22.2-1 for more information on CI.)

Geospatial Intelligence

4-21. *Geospatial intelligence* is the exploitation and analysis of imagery and geospatial information to describe, assess, and visually depict physical features and geographically referenced activities on the Earth. Geospatial intelligence consists of imagery, imagery intelligence, and geospatial information (JP 2-03). (Section 467, Title 10, USC, establishes GEOINT.)

Note. GEOINT consists of any combination of the following components: imagery, and/or imagery intelligence with geospatial information.

4-22. *Imagery* is a likeness or presentation of any natural or man-made feature or related object or activity, and the positional data acquired at the same time the likeness or representation was acquired, including: products produced by space-based national intelligence reconnaissance systems; and likenesses and presentations produced by satellites, aircraft platforms, unmanned aircraft systems, or other similar means (except that such term does not include handheld or clandestine photography taken by or on behalf of human intelligence collection organizations) (JP 2-03).

4-23. *Imagery intelligence* is the technical, geographic, and intelligence information derived through the interpretation or analysis of imagery and collateral materials (JP 2-03).

4-24. *Geospatial information* is information that identifies the geographic location and characteristics of natural or constructed features and boundaries on the Earth, including: statistical data and information derived from, among other things, remote sensing, mapping, and surveying technologies; and mapping, charting, geodetic data and related products (JP 2-03).

4-25. The GEOINT cell provides geospatial data generation, geospatial data analysis, geospatial data management, quality control, and data dissemination. GEOINT supports the multidirectional flow and integration of geospatially referenced data from all sources to achieve shared situational understanding of the operational environment, near real-time tracking, and collaboration between forces.

4-26. GEOINT activities necessary to support operations include the capability to define GEOINT requirements, discover and obtain GEOINT, put GEOINT in a useable form, and then maintain, use, and share GEOINT. The GEOINT cell interfaces directly with the user to define user requirements. Then the cell interfaces with the National System for Geospatial Intelligence to obtain and provide the best quality GEOINT possible directly to the Soldier. (For more information on GEOINT, see ATP 2-22.7, ATP 3-34.80, and AR 115-11.)

4-27. The GEOINT cell supports operations through five tasks:

- Define GEOINT mission requirements.
- Obtain mission-essential GEOINT.
- Evaluate available GEOINT data.
- Use and disseminate GEOINT.
- Maintain and evaluate GEOINT.

Human Intelligence

4-28. ***Human intelligence*** **is the collection by a trained human intelligence collector of foreign information from people and multimedia to identify elements, intentions, composition, strength, dispositions, tactics, equipment, and capabilities**.

4-29. A HUMINT source is a person from whom foreign information is collected to produce intelligence. HUMINT sources can include friendly, neutral, or hostile personnel. The source may either possess first- or second-hand knowledge normally obtained through sight or hearing. Categories of HUMINT sources include but are not limited to detainees, enemy prisoners of war, refugees, displaced persons, local inhabitants, friendly forces, and members of foreign governmental and nongovernmental organizations.

4-30. A HUMINT collector is a person who is trained, certified, and authorized to collect information from individuals (HUMINT sources) for the purpose of answering information collection requirements. HUMINT collectors are the only personnel authorized to conduct HUMINT collection operations. They are trained and certified enlisted personnel in military occupational specialty 35M, warrant officers in 351M, commissioned officers in 35F, and their Federal civilian employee counterparts. However, in order to conduct intelligence interrogations, trained HUMINT collectors must successfully complete one of the following courses, which are the only accepted interrogation training sources for military personnel:

- 35M Basic HUMINT Collector course at the U.S. Army Intelligence Center of Excellence, Fort Huachuca, Arizona.
- U.S. Marine Corps Basic Marine Air-Ground Task Force CI/HUMINT course at the Navy and Marine Corps Intelligence Center, Dam Neck, Virginia.
- Joint Interrogation Certification course at the HUMINT Training-Joint Center of Excellence, Fort Huachuca, Arizona. (Although this course has been discontinued, successful course graduates are authorized to conduct interrogations.)
- Defense Intelligence Agency I-10 course, Alexandria, Virginia. (Although this course has been discontinued, successful course graduates are authorized to conduct HUMINT interrogations.)

Note. Certification is conducted at the discretion of the combatant commander in accordance with established combatant command policies and directives.

4-31. HUMINT collection operations must be conducted in accordance with all applicable U.S. law and policy, which include EO 12333 as amended; EO 13491; DODM 5240.01 for procedures 1-10; DOD 5240.1-R for procedures 11-15; the law of war; relevant international law; relevant directives, including DODD 2310.01E and DODD 3115.09; DOD instructions; AR 381-100; FM 2-22.3; and military orders, including fragmentary orders. Additional policies and regulations apply to the management of contractors

engaging in HUMINT collection. Commanders will request assistance from their servicing judge advocate to interpret or deconflict these legal authorities. (See FM 2-22.3, ATP 2-22.31 [classified], and AR 381-100.)

4-32. HUMINT operations collect information from human sources through overt and clandestine means. HUMINT operations focus on a wide range of sources (such as detainees, refugees, civilians, friendly forces, and recruited personnel) for information that includes but is not limited to an adversary's plans, intentions, and strategies; research and development goals; physical and cultural infrastructure; and medical information.

4-33. Every HUMINT questioning session, regardless of the methodology used or the type of operation, consists of five phases. The five phases of HUMINT collection are—

- Planning and preparation.
- Approach.
- Questioning.
- Termination.
- Reporting.

4-34. The phases are generally sequential; however, reporting may occur at any point within the process when critical information is obtained and the approach techniques used will be reinforced, as required, through the questioning and termination phases.

4-35. HUMINT collection methodologies include five categories:

- Screening.
- Interrogation.
- Debriefing.
- Military source operations.
- Liaison.

Measurement and Signature Intelligence

4-36. *Measurement and signature intelligence* is information produced by quantitative and qualitative analysis of physical attributes of targets and events to characterize, locate, and identify targets and events, and derived from specialized, technically derived measurements of physical phenomenon intrinsic to an object or event (JP 2-0). (For more information on MASINT, see JP 2-0 and ATP 2-22.8 [classified]).

4-37. MASINT collection systems include but are not limited to radar, spectroradiometric, electro-optical, acoustic, radio frequency, and seismic sensors, as well as techniques for collecting chemical, biological, radiological, and nuclear (CBRN) signatures and other materiel samples.

4-38. MASINT requires the translation of technical data into recognizable and useful target features and performance characteristics. Computer, communications, data, and display processing technologies now provide MASINT to support operations.

4-39. MASINT provides intelligence to the commander to facilitate situational understanding and support targeting. Many sensors can defeat many of the camouflage, concealment, and deception techniques currently used to deceive information collection systems. Specifically, MASINT sensors have unique capabilities to detect missile launches; detect and track aircraft, ships, and vehicles; perform noncooperative target identifications and combat assessments; and detect and track fallout from nuclear detonations. Often, these sensors provide the first indicators of hostile activities.

4-40. The MASINT systems most familiar to Soldiers are employed by ground surveillance and CBRN reconnaissance elements. These systems span the entire EMS and their capabilities complement the other intelligence disciplines. MASINT provides, to varying degrees, the capability to—

- Use automatic target recognition and aided target recognition.
- Penetrate man-made and natural camouflage.
- Penetrate man-made and natural cover, including the ability to detect subterranean anomalies or targets.
- Counter stealth technology.
- Detect recently placed mines.
- Detect natural or man-made environmental disturbances in the Earth's surface not discernible through other intelligence means.
- Provide signatures (target identification) to munitions and sensors.
- Enhance passive identification of friend or foe.

- Detect the presence of CBRN agents including before, during, or after employment.
- Detect signature anomalies that may affect target-sensing systems.

4-41. Within DOD, the Defense Intelligence Agency provides policy and guidance for MASINT. Its policy and guidance do not interfere with Service component operations. Each Service has a primary command or staff activity to develop requirements and coordinate the MASINT effort. The Army G-2 staff is the functional manager for Army MASINT resources, policy, and guidance. Army weapons systems programs that require MASINT information to support system design or operations submit requests through INSCOM channels for data collection and processing.

4-42. The scientific and technical intelligence (S&TI) community also performs MASINT collection and processing primarily to support research and development programs and signature development. Every S&TI center has some involvement in MASINT collection or production that reflects that center's overall mission (for example, NGIC has responsibility for armored vehicles and artillery). Service research and development centers, such as the Communications-Electronics Command Research, Development, and Engineering Center, the Army Research Laboratory, and the Night Vision and Electronic Systems Laboratory, are also involved in developing sensor systems for collecting and processing MASINT. Elements within the Army Space and Missile Defense Command also exploit satellite-collected data for the purpose of MASINT exploitation. In addition to supporting the S&TI mission, INSCOM units also execute limited ground-based operational collection to support the ASCCs and subordinate units.

Open-Source Intelligence

4-43. OSINT is integral to Army intelligence operations. *Open-source intelligence* is intelligence that is produced from publicly available information and is collected, exploited, and disseminated in a timely manner to an appropriate audience for the purpose of addressing a specific intelligence requirement (Public Law 109-163). OSINT is exclusive to intelligence professionals using open-source information to answer specific intelligence requirements. In contrast, open-source *research* is the gathering of data, facts, instructions, or other material that is publicly available and used for general knowledge about a specific person, location, weapons system, or other item of interest. Open-source research is not OSINT. Any staff element may use open-source information to answer many different types of requirements.

4-44. Section 3038, Title 50, USC, and EO 12333 as amended govern OSINT. As such, OSINT is produced by intelligence professionals to support Army commanders in developing an understanding of complex situations, support fused all-source analysis, tip, and support intelligence operations and activities in other intelligence disciplines. (For more information, see ATP 2-22.9.)

4-45. *Open-source information* is information that any member of the public could lawfully obtain by request or observation as well as other unclassified information that has limited public distribution or access (JP 2-0). *Publicly available information* is information that has been published or broadcast for public consumption, is available on request to the public, is accessible online or otherwise to the public, is available to the public by subscription or purchase, could be seen or heard by any casual observer, is made available at a meeting open to the public, or is obtained by visiting any place or attending any event that is open to the public. Publicly available information includes information generally available to persons in a military community even though the military community is not open to the civilian general public (DODM 5240.01).

4-46. There are many different forms of open sources, to include social, print, broadcast media; internet; and open public-speaking forums. The collection means (techniques) for obtaining publicly available information from these communications media must be nonintrusive.

Note. When there is any doubt about the conduct of OSINT activities, intelligence personnel consult their unit or organization staff judge advocate. All OSINT operations conducted by intelligence professionals must comply with the legal restrictions in EO 12333 as amended, DODM 5240.01 for procedures 1-10, DOD 5240.1-R for procedures 11-15, Army Directive 2016-37, and AR 381-10. Intelligence personnel conducting OSINT activities must comply with all operations security requirements prescribed in AR 530-1 to prevent disclosure of critical and sensitive information.

4-47. The following characteristics from the role of OSINT in Army operations:

- **OSINT provides the foundation.** Open-source information provides updates to foundation information and real-time ongoing information to assist in developing and enhancing intelligence products and the intelligence disciplines. There is much information about the political, military, economic, social, and infrastructure of a region or local area obtainable from open-source information and readily changed to OSINT products. This foundation information and intelligence products can be essential to generating a clear picture for the commander. The variety of foundational websites associated with social structures, education systems, and news services provides a foundational perspective for intelligence knowledge.
- **OSINT addresses requirements.** The availability, depth, and range of open-source information enable intelligence professionals to satisfy many PIRs and information requirements without the use of specialized human or technical means of collection.
- **OSINT enhances collection.** Open-source information supports other requirements and provides information that optimizes the employment and performance of sensitive human and technical collection means. Examples of this type of information include biographies, cultural information, geospatial information, and technical data.
- **OSINT enhances production.** As part of single-source and all-source intelligence production, the use and integration of OSINT ensure commanders have the benefit of all sources of available information.

Signals Intelligence

4-48. *Signals intelligence* is intelligence derived from communications, electronic, and foreign instrumentation signals (JP 2-0). SIGINT provides unique intelligence information, complements intelligence derived from other sources, and is often used for cueing other sensors to potential targets of interest. For example, SIGINT, which identifies activities of interest, may be used to cue GEOINT to confirm that activity. Conversely, changes detected by GEOINT can cue SIGINT collection. The discipline is subdivided into three subcategories: communications intelligence (also called COMINT), ELINT, and foreign instrumentation signals intelligence (also called FISINT).

4-49. *Communications intelligence* is technical information and intelligence derived from foreign communications by other than the intended recipients (JP 2-0). Communications intelligence includes collecting data from target or adversary automated information systems or networks. It also may include imagery when pictures or diagrams are encoded by a computer network or radio frequency method for storage or transmission. The imagery can be static or streaming.

4-50. *Electronic intelligence* is technical and geolocation intelligence derived from foreign noncommunications electromagnetic radiations emanating from other than nuclear detonations or radioactive sources (JP 3-13.1). ELINT consists of two subcategories:

- **Operational ELINT**—is concerned with operationally relevant information such as the location, movement, employment, tactics, and activity of foreign noncommunications emitters and their associated weapon systems.
- **Technical ELINT**—is concerned with the technical aspects of foreign noncommunications emitters such as signal characteristics, modes, functions, associations, capabilities, limitations, vulnerabilities, and technology levels.

4-51. *Foreign instrumentation signals intelligence* is a subcategory of signals intelligence consisting of technical information and intelligence derived from the intercept of foreign electromagnetic emissions associated with the testing and operational deployment of non-United States aerospace, surface, and subsurface systems (JP 2-01).

4-52. SIGINT provides intelligence on threat intentions, capabilities, compositions, and dispositions. In addition, SIGINT provides information for the delivery of fires. The intelligence staff needs to understand how SIGINT assets are organized not only within the Army but also throughout DOD. The majority of SIGINT assets from the Armed Services, combined with national SIGINT assets, collaborate to support commanders from tactical to strategic levels. Only by understanding the SIGINT structure that transcends traditional Service components can the intelligence staff understand how to use SIGINT effectively.

Technical Intelligence

4-53. *Technical intelligence* is intelligence derived from the collection, processing, analysis, and exploitation of data and information pertaining to foreign equipment and materiel for the purposes of preventing technological surprise, assessing foreign scientific and technical capabilities, and developing countermeasures designed to neutralize an adversary's technological advantages (JP 2-0). The role of TECHINT is to ensure Soldiers understand the threat's full technological capabilities. With this understanding, U.S. forces can adopt appropriate countermeasures, operations, and tactics, techniques, and procedures. (For more information, see ATP 2-22.4.)

4-54. A comprehensive TECHINT network is vital to providing precise direction and purpose to DOD research and development and exploitation processes. This ensures quick and efficient neutralization of threat technological advantages and networks in direct support of the commander and S&TI community.

4-55. TECHINT has two primary responsibilities within Army intelligence operations:

- Provide information to supported commands based on the technical analysis of foreign material in accordance with those commands' stated requirements.
- Provide technical assessments of foreign technological threat capabilities, limitations, and vulnerabilities.

4-56. TECHINT includes S&TI, the Army Foreign Materiel Program, and weapons technical intelligence (WTI):

- S&TI organizations track and analyze foreign technological developments. They analyze the performance and operational capabilities of captured materiel that may have military applications.
- The Army Foreign Materiel Program is managed by the Army G-2. It is divided into foreign material acquisition, foreign material exploitation, and disposition of material no longer needed. The Army Foreign Materiel Program responds to U.S. weapons materiel developer TECHINT requirements, tactical requirements, and training requirements.
- As a function of counter-improvised explosive device operations, *weapons technical intelligence* is a subcategory of technical intelligence derived from the technical and forensic collection and exploitation of improvised explosive devices, associated components, improvised weapons, and other systems (JP 3-15.1).

4-57. As a specific application of TECHINT, WTI combines technical assessments, forensic science, and other critical enablers with all-source intelligence for use against irregular and nontraditional threats. WTI operationalizes TECHINT and focuses on immediate exploitation of captured weapons to rapidly respond to the tactical commander's PIRs and other requirements. WTI integrates a range of collection, exploitation, and analysis capabilities to support four critical outputs:

- To enable targeting by identifying, selecting, prioritizing, and tracking individuals and matching them with groups, weapons materiel, financiers, suppliers, insurgent leaders, and other related elements.
- To technically and forensically examine events and devices or weapons to identify observables, signatures, and to better understand linkages between technical design and tactical use to guide efforts of the protection warfighting function, as well as tip and cue information collection.
- To provide trend, pattern, and forensic analysis of improvised explosive devices, improvised weapons, and weapons components usage to identify the origin of materiel and components.
- To use information from captured enemy materiel collected during site exploitation activities to further detain and potentially support the prosecution of individuals for criminal activity.

4-58. Every TECHINT mission supports tactical through strategic requirements by the timely collection and processing of materiel and information, follow-on analysis and resulting production of intelligence, and dissemination to a wide range of consumers. Commanders rely on TECHINT to provide them with tactical and technological advantages to successfully synchronize and execute operations. TECHINT combines information to identify specific individuals, groups, and nation-states, matching them to events, places, devices, weapons, equipment, or contraband that associates their involvement in hostile or criminal activity.

COMPLEMENTARY INTELLIGENCE CAPABILITIES

4-59. Complementary intelligence capabilities contribute valuable information for all-source intelligence to facilitate the conduct of operations. The complementary intelligence capabilities are specific to the unit and circumstances at each echelon and can vary across DOD. These capabilities include but are not limited to—

- Biometrics-enabled intelligence (also called BEI).
- Cyber-enabled intelligence.
- DOMEX.
- Forensic-enabled intelligence (also called FEI).

Biometrics-Enabled Intelligence

4-60. Joint doctrine defines *biometrics* as the process of recognizing an individual based on measurable anatomical, physiological, and behavioral characteristics (JP 2-0). Biometrics as a process of confirming identity is not exclusive to the intelligence warfighting function. This enabler supports multiple activities and tasks of other warfighting functions. Army doctrine defines *biometrics-enabled intelligence* as intelligence resulting from the combination of biometric information with other intelligence, threat information, or information relating to other aspects of the operational environment in order to answer intelligence requirements (ATP 2-22.82).

Biometric Analysis

4-61. It is important for commanders, intelligence staffs, and all-source intelligence analysts across all echelons to assist in consolidating identities, other information, and intelligence to support tactical objectives as well as longer-term operational and strategic objectives. The production of biometrics-enabled intelligence products is critical as persons of interest move from location to location (within an AO) or are elevated in status (and move from one position to another) or as they transit from one AO to another. Products derived from biometric collection can provide context that is critical—related to persons of interest and their intent—to analysts across all echelons.

4-62. DOD biometric-enabled watchlist (BEWL) management is a mission assigned to NGIC. As the DOD BEWL mission manager, NGIC is responsible for: discovering threat identities; reviewing unit nominations (to ensure nominations meet DOD and intelligence community standards); maintaining, managing, and disseminating BEWL subsets; and managing encounters. Development and management of the unit watchlist is an intelligence staff duty. In producing their BEWL, units include collected biometric identities, related contextual information, and intelligence for future reference or further analysis in the analytic system. Unit-level and DOD BEWLs are shared through a dissemination process to provide an unclassified data set on handheld devices to the other U.S. Government systems and the DOD biometric network for positive identification of threat personnel.

Biometric Reports

4-63. Division and above echelons develop many biometrics-enabled intelligence products to support operations, including—

- **Biometric intelligence analysis reports (also called BIARs).** This report is an intelligence product that associates a biometric match with an individual in the biometric database. It is produced by sorting, analyzing, and linking the biometric match with the individual's history, along with all-source intelligence. It may contain the identification, background, assessment, and intelligence value of the subject.
- **BEWLs.** The BEWL is the primary analytic product produced through the all-source analysis production of collected and processed identity records. It is exported from the analytic tool and shared with the biometric network to identify persons of interest within biometric matching systems and handheld devices. Establishing the BEWL to support specified missions is an intelligence staff-level responsibility. The intelligence staff can customize the BEWL based on the unit's assigned mission and rules of engagement. Assistance in establishing a new customized BEWL based on a unit's assigned mission can be coordinated through INSCOM and NGIC. After

establishing the customized BEWL, the nomination, removal, or change process is automated through the analytic tool. (For more information, see ATP 2-22.82).

Cyber-Enabled Intelligence

4-64. The cyberspace domain provides another medium for information collection. Cyber-enabled intelligence is a complementary intelligence capability that provides the ability to collect information and produce intelligence products that portray the threat's ability to operate within the cyberspace domain and the effect of the threat on friendly capabilities. Cyber-enabled intelligence is produced through the combination of intelligence analysis and information concerning activities in cyberspace and the EMS. This intelligence supports situational understanding of the cyberspace domain. Cyber-enabled intelligence is based on operations conducted within the cyberspace domain and does not include operations and dominance within the EMS.

Note. The results of cyberspace electromagnetic activities can provide intelligence professionals with a significant amount of information concerning both the physical domain and the information environment.

4-65. Cyber-enabled intelligence facilitates decision making at all levels through the analysis and production of relevant and tailored intelligence on activities in the cyberspace domain that may affect the unit's ability to conduct operations. The intelligence can range from broadly disseminated products focused on general users to very specific and narrowly focused analysis and reports distributed via classified channels. The use of cyber-enabled intelligence facilitates an understanding of the threat's cyberspace electromagnetic capabilities, intentions, potential actions, and vulnerabilities, and their impacts on the environment, friendly operations, and the local populace.

4-66. The mission, authority, and oversight of an activity determine whether the activity is cyber-enabled intelligence or cyberspace-controlled. For example, the use of computers, technology, and networks facilitate all-source intelligence, the intelligence disciplines, and the other complementary intelligence capabilities. However, their use of computers, technology, and networks does not mean these are cyberspace operations. The authority for each discipline or capability governs the guiding methods and regulations for the conduct of each intelligence discipline or complementary intelligence capability.

Document and Media Exploitation

4-67. *Document and media exploitation* is the processing, translation, analysis, and dissemination of collected hardcopy documents and electronic media that are under the U.S. Government's physical control and are not publicly available (ATP 2-91.8). Threat intent, capabilities, and limitations may be derived through the exploitation of captured documents and media.

4-68. DOMEX is an increasingly specialized, full-time mission requiring advanced automation and communications support, analytical support, and expert linguists. When conducted properly, DOMEX—

- Provides the commander an initial assessment of captured information.
- Maximizes the value of intelligence gained from captured enemy documents and media.
- Provides the commander with timely and relevant intelligence to effectively enhance awareness of the threat's capabilities, operational structures, and intent.
- Assists in criminal prosecution or legal proceedings by maintaining chain of custody procedures and preserving the evidentiary value of captured enemy materiel, documents, and media.

4-69. DOMEX products become a force multiplier only when captured materials are rapidly exploited at the lowest echelon possible. DOMEX assets pushed down to the tactical level provide timely and accurate intelligence support. These assets are primarily responsible for screening and tactical exploitation of captured documents and media. This practice not only enables rapid exploitation and evacuation of captured materials but also hastens the feedback commanders receive from the higher echelon analysis. DOMEX assets also deliver items of operational or strategic value to higher level processing facilities for further exploitation.

Intelligence staffs need to use the appropriate communications medium to pass vital information to the lowest echelon, especially to the capturing unit.

4-70. It is essential to pass critical information quickly to those who need it, specifically, tactical commanders. Intelligence staffs are responsible for reporting and disseminating DOMEX-derived information in a manner that ensures the information reaches not only the next higher echelon but also the tactical commander most affected by the information.

4-71. DOMEX personnel are usually not available below the battalion level except in MI organizations. This requires maneuver battalion intelligence staffs to prepare their subordinate units for DOMEX tasks. When intelligence and personnel qualified in the appropriate languages for the AO are available, they can be task-organized as intelligence support teams and placed with companies or platoons. Alternatively, the intelligence section can train company or platoon personnel in specific handling, screening, and inventorying techniques.

4-72. Where tactical assets are insufficient, operational and strategic assets can support a unit's organic assets, either by personnel augmentation or by virtual support from DOMEX support elements, who provide this support worldwide. These organizations use specialized techniques and procedures to extract additional information from captured audio and video materials. Application of specialized processing techniques and procedures may require the classification of the processed information and restrict its dissemination. (For more information on DOMEX, see ATP 2-91.8.)

Forensic-Enabled Intelligence

4-73. Forensics involves the scientific analysis of linking persons, places, things, and events. *Forensic-enabled intelligence* is the intelligence resulting from the integration of scientifically examined materials and other information to establish full characterization, attribution, and the linkage of events, locations, items, signatures, nefarious intent, and persons of interest (JP 2-0).

4-74. Forensic techniques provide timely and accurate information that facilitates situational understanding and supports decision making. This includes collecting, identifying, and labeling collected items for future exploitation. The collection of latent fingerprints, deoxyribonucleic acid (known as DNA), and other forensic data can aid in more in-depth analysis and better intelligence about the operational environment.

4-75. Forensic-enabled intelligence assists in accurately identifying persons, networks, and complex threats, and attributes them to specific incidents and activities. The effort is often critical in supporting the targeting process. Forensic-enabled intelligence can identify and determine the source of origin of captured materiel, documents, and media. Accurate site documentation of incidents or events, material and structural analysis, and supporting data and information from the various forensic processes and techniques can provide valuable data and enhance operational tactics, techniques, and procedures. For example, timely trace detection or material analysis of unknown substances can assist in protecting the force from contaminants, toxins, and other hazards. Incorporating information obtained via toxicology, pathology and other forensic techniques into forensic-enabled intelligence can assist in identifying health threats within the AO.

Intelligence Processing, Exploitation, and Dissemination Capabilities

4-76. Intelligence PED capabilities are the personnel, specialized intelligence and communications systems, software and advanced technologies that execute the PED functions. Intelligence PED operations can be performed either from a deployed expeditionary location or a reach site in theater or the United States. Intelligence PED capabilities can be organic to the intelligence unit, task-organized, or distributed from a centralized location through the network as required.

4-77. The effort to plan and control intelligence PED is part of mission command. The G-2/S-2 advises the staff on intelligence PED requirements and capabilities when planning information collection operations. The commander and staff resource and prioritize supporting intelligence capabilities, including expeditionary or reach PED capabilities, through thorough staff planning (based on recommendations from the G-2/S-2).

4-78. When requesting intelligence PED capabilities, the gaining G-2/S-2 and intelligence unit commander are responsible for coordinating and planning intelligence PED activities. However, the allocating echelon is also

responsible for ensuring adequate planning, coordination, and use of PED capabilities. Some intelligence PED capability employment considerations for the gaining G-2/S-2 and intelligence unit commander include—

- **Intelligence architecture.** Employment of intelligence PED capabilities depends on how the collection asset and supporting PED element or unit fits into the intelligence architecture. The employment is also specific to the intelligence discipline or complementary intelligence capability and supported echelon. MI units should capture their functional requirements during planning to ensure they request adequate intelligence PED capabilities.
- **Communications.** All intelligence operations depend on integrating multiple communications systems, networks, and information services. It is important to consider and understand hardware and software requirements and compatibility, interoperability issues, bandwidth priority and capacity, and maintenance requirements.
- **Reporting.** Operating effectively within the intelligence architecture requires system operators to understand PED and reporting procedures, requirements, and timelines for operations and intelligence channels as well as for technical channels.
- **Targeting criteria.** Supporting lethal and nonlethal effects require system operators to be thoroughly knowledgeable with the different targeting criteria, including minimum accuracy and timeliness standards for each specific high-payoff target.
- **Technical channels.** System operators must understand how technical channels operate and how to use technical guidance to enhance collection. Additionally, intelligence PED capabilities assist in refining technical guidance.
- **Training.** Intelligence leaders inform the commander and staff on intelligence PED capabilities and limitations. Facilitating the integration of intelligence PED capabilities requires intelligence leaders to conduct training with the intelligence unit and intelligence PED system operators, analysts, and maintainers.
- **Sustainment.** Intelligence PED capabilities and resources can provide a significant maintenance and logistic challenge to the intelligence unit. Reducing these challenges requires the intelligence unit to conduct thorough planning and coordination.

This page intentionally left blank.

Chapter 5

Fighting for Intelligence

Since Army forces compete with an adaptive enemy; perfect planning and information collection seldom occurs. Intelligence is not perfect, information collection is not easy, and a single collection capability is not persistent and accurate enough to provide all of the answers. During large-scale combat operations, Army forces will have to fight for intelligence. To achieve situational understanding against peer threats, friendly forces must strive to identify or open windows of opportunity across domains. Staff integration is difficult but crucial; the staff must collaborate to overcome challenges and mitigate information collection capability and system limitations by developing an integrated information collection plan. Fighting for intelligence also encompasses the basics of establishing an effective intelligence architecture, synchronizing the intelligence warfighting function, and planning and conducting information collection.

THE CHALLENGE

5-1. Producing intelligence and executing information collection differ significantly based on the Army's strategic role. For example, intelligence operations conducted during shaping operations differ drastically from intelligence operations conducted during large-scale combat operations.

5-2. Of the four Army strategic roles (shape, prevent, conduct large-scale ground combat, and consolidate gains), the intelligence warfighting function is most challenged to meet the vast number of large-scale combat operation requirements. Large-scale combat operations are intense, lethal, and brutal—creating conditions, such as complexity, chaos, fear, violence, fatigue, and uncertainty. Battlefields will include noncombatants crowded in and around dense urban areas. To further complicate operations, enemies will employ conventional and unconventional tactics, terrorism, criminal activities, and information warfare. Activities in the information environment, which includes cyberspace, will often be inseparable from land operations. The fluid and chaotic nature of large-scale combat operations will cause the greatest degree of fog, friction, and stress on the intelligence warfighting function.

5-3. When fighting a peer threat during large-scale combat operations, units must be prepared to fight for intelligence against enemy formations, a range of sophisticated threat capabilities, and many unknown conditions within the operational environment. The challenges to information collection include integrated air defense systems, long-range fires, counterreconnaissance, cyberspace and EW operations, and camouflage, concealment, and deception.

5-4. A successful information collection effort is key to achieving and exploiting positions of relative advantage. The intelligence staff can then analyze collected information and provide products, updates, and predictive assessments that support targeting, decision making, and the execution of branches and/or sequels. Staff integration, operational planning, and information collection plans are not foolproof and can become ineffective. Conceptually, fighting for intelligence is not new, but the Army must emphasize this principle due to the complexity of large-scale operations. Conducting information collection requires thorough and creative planning, aggressive execution, and adjustments based on the situation. Key aspects of fighting for intelligence to support operations include the following:

- Commanders drive intelligence.
- Effective staff integration is crucial.
- Effective intelligence requires a comprehensive intelligence architecture.
- A thoroughly developed and flexible information collection plan is critical.

- A successful information collection plan begins with identifying the right requirements.
- Together, commanders, staffs, and subordinate units strive and constantly adjust to develop and execute a layered and aggressive information collection plan.

THE COMMANDER'S ROLE AND STAFF INTEGRATION

5-5. Commanders and staffs need timely, accurate, relevant, and predictive intelligence to understand threat characteristics, goals and objectives, and COAs. Precise intelligence is critical to targeting threat capabilities at the right time and place to open windows of opportunity across domains. Commanders and staffs must have detailed knowledge of the threat's strengths, vulnerabilities, organizations, equipment, capabilities, and tactics to plan for and execute friendly operations.

5-6. Collaboration within and between the entire staff produces integration essential to effective mission command and synchronized operations. While all staff sections have clearly defined functional responsibilities, they cannot work efficiently without complete cooperation and coordination among all sections and cells. Key staff synchronization and integration occur during—

- IPB.
- Army design methodology, the military decision-making process (MDMP), and the rapid decision-making and synchronization process.
- Information collection.
- Targeting.
- Assessments.

5-7. The G-2/S-2 supports the commander's ability to understand the operational environment and visualize operations by leading the IPB process and portraying the enemy throughout the MDMP, developing the information collection plan, updating the intelligence running estimate, and developing intelligence products and reports. The commander's role is to direct the intelligence warfighting function through this relationship with the G-2/S-2. Commanders must stay constantly engaged with their G-2 or S-2; close interaction between them is essential as the intelligence staff supports unit planning and preparation through the integrating processes and continuing activities.

5-8. Commanders and staffs use the integrating processes (IPB, targeting, and risk management) to synchronize specific functions throughout the operations process. They always plan for and coordinate the continuing activities: liaison, information collection, security operations, protection, terrain management, and airspace control. The intelligence staff supports the integrating processes and continuing activities (information collection) by providing all-source analysis of threats, terrain and weather, and civil considerations. (See ADRP 5-0 for more on the integrating processes and continuing activities.)

INTELLIGENCE AND THE INTEGRATING PROCESSES

5-9. There is an ever-growing volume of data and information from numerous sources about the operational environment that can improve the commander's visualization of the battlefield in time and space. Situational understanding enables the commander to better—

- Make decisions.
- Prioritize and allocate resources.
- Assess and take necessary risks.
- Understand the needs of higher and subordinate commanders.

5-10. The commander and staff depend on a skilled intelligence staff to answer PIRs and other requirements through the synchronization of the intelligence warfighting function with mission command. The intelligence staff conducts all-source analysis that facilitates the production of IPB products; supports the information collection effort, the targeting effort, and risk management; and provides all-source intelligence analysis (including conclusions and projections of future conditions or events).

Perform Intelligence Preparation of the Battlefield

5-11. The G-2/S-2 leads the staff through the IPB process. The IPB process considers all threat capabilities within and across each domain within the unit's AO and area of interest and the relevant aspects of the information environment. The other staff sections assist the intelligence staff in developing the IPB products required for planning. The IPB process consists of the following four steps: define the operational environment, describe environmental effects on operations, evaluate the threat, and determine threat COAs. IPB starts immediately upon receipt of the mission, is refined throughout planning, and is updated to support subsequent operational planning. (See ATP 2-01.3 for more on IPB.) The following aspects of IPB support mission analysis:

- Evaluate military aspects of the terrain, weather effects, and civil considerations.
- Identify threat capabilities.
- Develop threat models.
- Develop high-value target lists.
- Develop an event template and matrix.

Provide Intelligence Support to Targeting

5-12. The intelligence staff is essential to targeting (both lethal and nonlethal actions). Intelligence supports the planning (target development), preparation, execution, and assessment of direct and indirect fires and EW. The intelligence staff also ensures the information collection plan supports the finalized targeting plan (target detection). Table 5-1 lists the most important subtasks, products, and considerations associated with intelligence support to targeting. (For more on targeting, see ATP 3-60; for more on intelligence support to targeting, see ADRP 1-03 and ATP 2-01.3.)

Table 5-1. Intelligence support to targeting

Receive guidance on—	• Commander's intent • High-payoff targets • Attack criteria • Rules of engagement	• Lead time between decision points and target areas of interest • Combat assessment requirements
Develop—	• Modified combined obstacle overlay • Situation and event templates	• High-value targets • Information collection plan
Explain—	Threat courses of action, as part of war gaming, based on friendly courses of action: • Refine the event template • Assist in developing the high-payoff target list, target selection standard matrix, and attack guidance matrix	
Produce—	Collection management tools	
Collect—	Information for target nomination, validation, and combat assessment	
Disseminate—	• High-payoff target-related information and intelligence to the fires cell or appropriate location immediately • Pertinent information and battle damage assessment in accordance with standard operating procedures or other instructions	

Provide Intelligence Support to Risk Management

5-13. Risk management is the Army's primary process for identifying and controlling risks during operations. *Risk management* is the process to identify, assess, and control risks and make decisions that balance risk cost with mission benefits (JP 3-0). The chief of protection (or S-3 in units without a protection cell), in coordination with the safety officer, integrates risk management into the MDMP. The intelligence staff participates in the overall risk management process and integrates risk management into collection management when recommending tasks for information collection assets.

5-14. Commanders must focus and use intelligence to explicitly understand the lethality of large-scale combat operations and to preserve their combat power and take the appropriate operational risk to achieve the end state. Using intelligence to see and understand within each domain can reduce risk to the friendly force and enhance success in chaotic and high-tempo operations. The distribution of specific intelligence

collection systems, personnel, and equipment enhances the capability of the combined arms team to concentrate combat power and reduce risk. Intelligence provides the commander the ability to detect adversary capabilities and activities, analyze enemy intentions, and track enemy capabilities across all domains to inform decisions and provide realistic assessments of operational and tactical risk. During situation development, analysts determine the significance of collected information and its significance relative to predicted threat COAs. Through predictive analysis, the staff templates threat activity or trends that present opportunities or risks to the friendly force. This support assists the commander and staff in deciding when and where to concentrate sufficient combat power to defeat the threat while mitigating risk.

INTELLIGENCE AND THE CONTINUING ACTIVITIES: INFORMATION COLLECTION

5-15. *Information collection* is an activity that synchronizes and integrates the planning and employment of sensors and assets as well as the processing, exploitation, and dissemination systems in direct support of current and future operations (FM 3-55). Information collection is an integrated intelligence and operations function. The intelligence staff conducts information collection in collaboration with the operations staff to collect, process, and analyze information the commander requires concerning threats, terrain and weather, and civil considerations that affect operations. The primary Army information collection missions/means are reconnaissance, surveillance, security operations, and intelligence operations.

5-16. A successful information collection effort results in the timely collection and reporting of relevant and accurate information, which either supports the production of intelligence or is disseminated as combat information. The information collection effort includes organic units and capabilities and support from DOD intelligence assets, as well as nonintelligence sources, which provide civil considerations and sociocultural information. (See FM 3-55 and ATP 3-55.4.) The information collection tasks are collection management, direct information collection, execute collection, and conduct intelligence-related missions and operations.

Collection Management

5-17. Collection management is the task of analyzing requirements, evaluating available assets (internal and external), recommending taskings to the operations staff for information collection assets, submitting requests for information for adjacent and higher collection support, and assessing the effectiveness of the information collection plan. The continuous functions of collection management identify the best way to satisfy the requirements of the supported commander and staff. These functions are not necessarily sequential. Collection management inherently requires an understanding of the relative priority of incoming requests for collection and PED. Additionally, collection management includes the staff vetting requirements against current intelligence holdings to ensure resources are not wasted collecting information that is already available. (See ATP 2-01.)

Direct Information Collection

5-18. The operations staff (based on recommendations from the rest of the staff) tasks, directs, and when necessary, retasks information collection assets. By tasking and directing information collection assets, the staff ensures the most effective and balanced use of assets across the subordinate units in order to answer all requirements. The operations staff tasks units and information collection assets by issuing warning orders, fragmentary orders, and operation orders. Additionally, they continuously monitor the information collection effort and retask assets as requirements are refined, updated, and added. (See FM 3-55.)

Execute Collection

5-19. Executing collection focuses on specific requirements. This collection is accomplished through the execution of tactical missions (such as the primary means of information collection: reconnaissance, surveillance, security operations, and intelligence operations) based on CCIRs and other requirements. Collection activities acquire data and information about threats and relevant aspects of the AO. They provide that information to intelligence PED and analysis elements. Typically, collection activities begin soon after receipt of the mission and continue throughout preparation and execution of operations. They do not cease after the operation concludes but continue as required. This allows the commander to focus combat power, execute current operations, and prepare for future operations simultaneously.

PLANNING CONSIDERATIONS AND INFORMATION REQUIREMENTS

5-20. By supporting the integrating processes, the intelligence warfighting function supports the commander's decisions, situational understanding, MDMP, targeting, and force protection considerations. During all operations, both friendly and enemy forces will endeavor to set conditions to develop a position of relative advantage.

5-21. Through generating intelligence knowledge, IPB, and situation development, the intelligence staff enables commanders and staffs to develop a realistic and sufficiently flexible plan to account for enemy objectives, COAs, and capabilities. The intelligence staff also provides warning intelligence, which indicates the start of hostilities, a major change or escalation to the nature of the conflict, or the introduction of a significant new capability.

PLANNING CONSIDERATIONS FOR THE INTELLIGENCE WARFIGHTING FUNCTION

5-22. The intelligence warfighting function is designed to systematically answer intelligence requirements. Commanders focus the effort by clearly articulating intent, stating requirements, prioritizing targets, and assessing effectiveness as operations progress. However, in order to drive intelligence, commanders and staffs must have realistic expectations about intelligence capabilities and available assets. The following are intelligence warfighting function planning considerations:

- **Intelligence reduces uncertainty; it does not eliminate it.** The commander has to determine the presence and degree of risk involved in conducting a particular operation. The time available to plan and prepare is directly related to the risk. Usually, the more time allotted to planning and preparation, the lower the risk. One of the commander's considerations is determining the appropriate balance between the time allotted for collection weighed against the operational necessity for quickly executing an operation. It takes time to collect information and develop it into detailed and precise intelligence products.
- **The intelligence warfighting function comprises finite resources and capabilities.** Intelligence systems and Soldiers trained in specific skills are limited. Once lost to action or accident, these systems and Soldiers are not easily replaceable; in some cases, it may not be possible to replace them during the course of the current operation. The loss of Soldiers and equipment can result in the inability to detect or analyze threat actions. Additionally, the loss of qualified language-trained Soldiers, especially those trained in low-density languages or skills, could adversely affect intelligence operations.
- **To provide effective intelligence, the intelligence warfighting function must have adequate communications and network-enabled capabilities.** Commanders and staffs must ensure the allocation of communications support and resources to intelligence is appropriate.

INFORMATION REQUIREMENTS

5-23. Information requirements differ significantly based on the defensive or offensive task, the specific situation, and unique requirements for concurrent supporting operations such as deep operations and missions in the various consolidation areas. During both friendly defensive and offensive tasks, there are consolidation area requirements to detect enemy bypassed or stay-behind forces, special purpose forces, irregular forces, terrorists, and efforts to create an insurgency or conduct information warfare. (See FM 3-0 and FM 2-0 for more detailed discussions on the defensive and offensive tasks and the specific intelligence support to each form of the defense and offense.)

Defensive Tasks

5-24. During friendly defensive tasks, enemy forces employ precision fires, other long-range fires, and nonlethal capabilities (such as cyber and EW) to attack friendly mission command and key supporting and sustaining capabilities. Friendly forces aim to prepare defensive positions and set conditions while the enemy attempts to set the timing of, location of, and conditions for battle. The three basic friendly defensive tasks are area defense, mobile defense, and retrograde.

5-25. Intelligence supports friendly force efforts to protect the force, disburse and reassemble the force as necessary, and answer requirements on when, where, and in what strength the enemy will attack. This intelligence supports decisions on setting the defense, employing various capabilities, repositioning forces, conducting counterattacks, and when possible, transitioning to offensive tasks.

5-26. The intelligence staff leads the rest of the staff in identifying when, where, with what strength, and how the enemy will attack. This allows the commander to identify opportune times to conduct spoiling attacks and reposition forces. The entire staff also identifies threats to support and consolidation areas, such as enemy special purpose forces and irregular activities, which may interfere with control of the defense. The intelligence staff leads the rest of the staff in determining—

- The threat intent, objectives, and associated decision points tied to the decisive and/or key terrain associated with the operation.
- General trafficability and mobility considerations, ground mobility corridors, avenues of approach, intervisibility lines within key areas, specific terrain analysis, and weather effects on the operation.
- The likely composition, focus, routes, and a time window for arrival of enemy reconnaissance formations.
- The likely scheme of maneuver for the attacking enemy force.
- Intent, activities, orientation, and predicted locations for: enemy command and control and communications command posts; enemy artillery formations and air defense systems; enemy aviation units; threat EW capabilities; enemy engineer support, chemical support, and special operations forces; and enemy activities in friendly consolidation areas.
- The likely use and intent for threat cyberspace capabilities and likely enemy use of deception.
- The likely location of and time window to commit enemy reserve forces, likely use of second echelon enemy forces to isolate or encircle friendly forces, and likely times and locations where the friendly commander can launch a spoiling attack.

Offensive Tasks

5-27. During friendly offensive tasks, enemy forces attempt to disrupt friendly activities by employing precision fires, other long-range fires, and nonlethal capabilities (like cyber and EW). Therefore, friendly forces strive to conduct the necessary movements, prepare logistical support, and set other conditions while the enemy attempts to prevent friendly forces from effectively synchronizing adequate combat power. The four basic friendly offensive tasks movement to contact, attack, exploitation, and pursuit.

5-28. Intelligence determines when and where the enemy will concentrate combat power, find gaps and vulnerabilities in enemy defenses, and predict how the enemy will conduct any counterattacks. This intelligence supports decisions on conducting information collection, executing long-range fires, penetrating enemy security areas, overcoming obstacles, avoiding enemy strengths, defeating enemy counterattacks, and when possible, transitioning to exploitation or pursuit.

5-29. The intelligence staff leads the rest of the staff in a careful analysis of the terrain, including ground and air avenues of approach, and other significant factors of the operational environment. Then the staff identifies a broad range of enemy COAs with emphasis on the enemy's most likely and most dangerous COAs in the war-gaming portion of the MDMP. Because of the inherent vulnerability of friendly forces during a movement to contact, the intelligence staff must not underestimate the enemy and complexities of the mission. Predictions of enemy COAs should be thorough; at a minimum, they should account for enemy maneuver units (two echelons below) and all key enemy capabilities and enablers. A thorough IPB and war-gaming effort indicates areas where contact with the enemy is likely, as well as friendly and enemy vulnerabilities by phase of the operation. The intelligence staff leads the rest of the staff in determining—

- The threat intent, objectives, and associated decision points tied to decisive and/or key terrain associated with the operation.
- General trafficability and mobility considerations, ground mobility corridors, avenues of approach, intervisibility lines within key areas, specific terrain analysis, and weather effects on the operation.

- The intent, activities, orientation, and predicted locations for: obstacles, including areas the enemy is likely to use fire support coordination measures; enemy reconnaissance, security forces, and observation posts; enemy aviation units, including forward arming and refueling points; enemy defensive locations with likely close obstacles and engagement areas within the main defensive zone; enemy command and control and communications facilities and systems; enemy artillery, rocket units, and air defense systems; enemy engineer support, chemical support, and special operations forces; threat EW capabilities; enemy reserve forces, including when they would be committed; and enemy activities in friendly consolidation areas.
- The likely use and intent for threat cyberspace capabilities and likely enemy use of deception.
- Indications that the enemy is still conducting movement, possibly turning the operation into a meeting engagement or causing friendly forces to employ a hasty defense.

OTHER KEY TASKS FOR SHAPING LARGE-SCALE COMBAT OPERATIONS

5-30. There are many important aspects of all offensive and defensive tasks, including the tactical enabling tasks. In combat, seizing the initiative involves conducting reconnaissance, maintaining security, performing defensive and offensive tasks at the earliest possible time, forcing the enemy to culminate offensively, and setting the conditions for decisive operations. Operations in the deep area involve efforts to prevent uncommitted or out-of-contact enemy maneuver forces from being committed coherently or preventing enemy enabling capabilities, such as fires and air defense, from creating effects in the close area. The purpose of operations in the deep area is to set conditions for success in the close area or to set conditions for future operations. Therefore, units must execute successful reconnaissance, security operations, and deep operations before or as part of all offensive and defensive tasks:

- **Reconnaissance.** Reconnaissance is typically conducted to gain more information about a terrain feature, geographic area, enemy force, or other operational or mission variable that is important for a commander to formulate, confirm, or modify a COA. Commanders normally assign reconnaissance objectives, which can be information about a specific geographic location, a specific enemy activity to be confirmed or denied, or a specific enemy unit to be located and tracked. Therefore, every reconnaissance is different and there is no general list of information requirements. (See FM 3-0.)
- **Security operations.** The main difference between performing security tasks and reconnaissance tasks is that security tasks orient on the force or facility being protected, while reconnaissance tasks are enemy- and terrain-oriented. The goal of security tasks is protecting a force from surprise and reducing the unknowns in any situation. Commanders may perform security tasks to the front, flanks, or rear of a friendly force. Security tasks are shaping operations. As a shaping operation, economy of force is often a consideration when planning. Intelligence support for security operations simply follows the intelligence considerations for the offensive or defensive task the main unit is conducting. Security operations encompass five tasks: screen, guard, cover, area security, and local security. (See FM 3-0.)
- **Deep operations.** Deep operations are combined arms operations directed against uncommitted enemy forces or capabilities before they can engage friendly forces in the close fight. Deep operations also contribute to setting the conditions to transition to the next phase of an operation (for example, from a defensive to an offensive task). Deep operations are not simply attacking an enemy force in depth. Instead, they are the sum of all activities that influence when, where, and in what condition enemy forces will be committed. Deep operations are normally planned and controlled at theater army, corps, and division levels, and typically include information collection, target acquisition, ground and air maneuver, fires, cyberspace electromagnetic activities, and information operations either singly or in combination. Intelligence support to deep operations is an inherent part of intelligence support to targeting. The intelligence staff leads the rest of the staff in identifying when, where, in what strength, and how the enemy will begin movement, launch attacks, or defend. (See ATP 3-94.2.)

THE INFORMATION COLLECTION PLAN AND THE INTELLIGENCE ARCHITECTURE

5-31. After completing the MDMP (to include developing requirements), the commander and staff complete an information collection plan. Developing the information collection plan involves overlaying the information requirements on the current situation, operational plan, and the existing intelligence architecture.

DEVELOPING THE INFORMATION COLLECTION PLAN

5-32. Commanders and staffs use the principles of information collection, IPB and other key staff products, and knowledge of information collection capabilities and limitations to develop the information collection plan. As commanders and staffs develop the plan, they may encounter information collection gaps due to factors that include but are not limited to inadequate collection range, unfavorable terrain, or lack of technical capabilities.

5-33. PIRs and the most important intelligence requirements and targeting requirements form the basis of an integrated information collection plan. Through analysis, the staff determines the best way to satisfy each requirement. Based on the MDMP, including a thorough war game, the commander and staff develop a detailed and realistic information collection plan to answer as many requirements as possible.

5-34. Staff integration and synchronization ensures the enemy situation and the operational environment (not just a predetermined operational plan) drive the information collection effort. Generally, intelligence units and collectors are allocated based on priorities and the unit's main effort. Additionally, a unit may have to depend on the higher echelon to provide intelligence support during a particular operational phase because the unit is constantly moving or has a high operating tempo and cannot produce its own intelligence.

5-35. The information collection plan must be simple enough to execute, should avoid being predictable to enemy forces, and should include adequate operations security measures to protect friendly operations. Effective information collection planning depends on collaboration across the echelons in order to vertically and horizontally layer the information collection effort. A layered and continuous information collection effort provides better opportunities for detecting enemy formations, fires capabilities, and critical specialized capabilities that pose the greatest threat to friendly forces. (See FM 3-55 and ATP 2-01 for more on developing an information collection plan.)

ESTABLISHING THE INTELLIGENCE ARCHITECTURE

5-36. When the commander and staff start planning, many aspects of and limitations to information collection have already been set based on the specifics of the intelligence architecture and mission command network. While units can change a few components of the intelligence architecture within a short timeframe, most components are already set or require a fairly long lead time to change. Therefore, setting the intelligence architecture is an important aspect of the shape and deter roles.

5-37. The intelligence architecture is developed well before deployment based on future planning and assumptions on the employment of intelligence capabilities. Periodically, units will revise the intelligence architecture based on new planning factors and assumptions, as well as the addition of new capabilities. Before deployment, units task-organize information collection capabilities based on the intelligence architecture and other factors such as the command post structure and other key mission command nodes. Following initial deployment, the intelligence architecture will already be largely established and each unit will develop an information collection plan within the context of the architecture.

5-38. The command and staff must understand the relationship of national to tactical intelligence; theater-specific procedures, networks, and systems; the strengths and vulnerabilities of organic and supporting intelligence units, personnel, and systems; and the overarching operation plan in order to establish the intelligence architecture.

DEVELOPING THE SITUATION AND CONTINUOUS INFORMATION COLLECTION

5-39. The fight for intelligence becomes more difficult as units receive long-range fires and make contact with enemy forces. Information collection and intelligence analysis are integral to developing the situation. Additionally, the corps and division intelligence staffs may attend or watch theater-level collection management boards, giving them insight into national and joint priorities and coverage. This insight, coordination, and preparation create opportunities for tactical units to leverage national and joint capabilities. The theater army, corps, and division G-2s convene an operations and intelligence working group, or some form of synchronization meeting, with key staff and subordinate units. These intelligence synchronization meetings (normally conducted via video teleconferencing) create a common understanding of the enemy, ensure information collection plans address changes in the situation, and coordinate continuous information collection across echelons and units.

5-40. The intelligence staff conducts synchronizing activities to assist the unit in developing the situation and adjusting information collection. Information collection requires airspace, terrain, and space deconfliction and coordination as well as adequate PED capabilities to ensure assets are able to operate efficiently and effectively. The staff considers whether the unit has the intelligence collection and PED capabilities, capacity, and architecture required to support planned and projected operations. There are many requirements for the G-2/S-2 and the intelligence staff to participate in unit battle rhythm activities to synchronize intelligence support and the information collection effort. The intelligence staff provides updates on the situation and briefs changes to the information collection plan during various commander updates, boards, cell meetings, and other meetings. This creates a common understanding of the enemy, ensures information collection plans address changes in the situation, and coordinates continuous information collection across echelons and units.

5-41. Information collection is continuous through the execution of operations and transition to consolidate gains. The all-source analytical effort is key to informing the commander and staff, who in turn support the continued fight for intelligence. Therefore, G-2/S-2s, all-source analysts, and collection managers must collaborate closely. Intelligence analysis assists in discovering collection gaps, generating more information requirements, and driving all operations. Additionally, analysis assists in determining the effectiveness of the information collection effort. That assessment leads to adjustments in the information collection plan, making it more efficient and effective. Thorough planning allows continuous collection planning through all phases, branches, and sequels of an operation.

Glossary

The glossary lists acronyms and terms with Army or joint definitions. Where Army and joint definitions differ, (Army) precedes the definition. The glossary lists terms for which ADP 2-0 is the proponent with an asterisk (*) before the term. For other terms, it lists the proponent publication in parentheses after the definition.

SECTION I – ACRONYMS AND ABBREVIATIONS

ADP	Army doctrine publication
ADRP	Army doctrine reference publication
AO	area of operations
AR	Army regulation
ASCC	Army Service component command
ASCOPE	areas, structures, capabilities, organizations, people, and events (civil considerations)
ATP	Army techniques publication
AUTL	Army Universal Task List
BCT	brigade combat team
BEWL	biometric-enabled watchlist
CBRN	chemical, biological, radiological, and nuclear
CCIR	commander's critical information requirement
CI	counterintelligence
CJCSI	Chairman of the Joint Chiefs of Staff instruction
COA	course of action
DOD	Department of Defense
DODD	Department of Defensive directive
DODI	Department of Defense instruction
DODM	Department of Defensive manual
DOMEX	document and media exploitation
DSCA	defense support of civil authorities
ELINT	electronic intelligence
E-MIB	expeditionary-military intelligence brigade
EMS	electromagnetic spectrum
EO	executive order
EW	electronic warfare
FM	field manual
G-2	assistant chief of staff, intelligence
G-3	assistant chief of staff, operations
G-6	assistant chief of staff, signal

GCC	geographic combatant command
GEOINT	geospatial intelligence
HUMINT	human intelligence
INSCOM	United States Army Intelligence and Security Command
IPB	intelligence preparation of the battlefield
JP	joint publication
MASINT	measurement and signature intelligence
MDMP	military decision-making process
METT-TC	mission, enemy, terrain and weather, troops and support available, time available, and civil considerations (mission variables)
MI	military intelligence
MIB-T	military intelligence brigade-theater
NGIC	National Ground Intelligence Center
OSINT	open-source intelligence
PED	processing, exploitation, and dissemination
PIR	priority intelligence requirement
PMESII-PT	political, military, economic, social, information, infrastructure, physical environment, and time (operational variables)
S-2	battalion or brigade intelligence staff officer
S-3	battalion or brigade operations staff officer
S-6	battalion or brigade signal staff officer
S&TI	scientific and technical intelligence
SIGINT	signals intelligence
TECHINT	technical intelligence
U.S.	United States
USC	United States Code
WTI	weapons technical intelligence

SECTION II – TERMS

***all-source intelligence**

(Army) The integration of intelligence and information from all relevant sources in order to analyze situations or conditions that impact operations.

(joint) Intelligence products and/or organizations and activities that incorporate all sources of information in the production of finished intelligence. (JP 2-0)

adversary

A party acknowledged as potentially hostile to a friendly party and against which the use of force may be envisaged. (JP 3-0)

biometrics

(joint) The process of recognizing an individual based on measurable anatomical, physiological, and behavioral characteristics. (JP 2-0)

biometrics-enabled intelligence

(Army) Intelligence resulting from the combination of biometric information with other intelligence, threat information, or information relating to other aspects of the operational environment in order to answer intelligence requirements. (ATP 2-22.82)

collection

In intelligence usage, the acquisition of information and the provision of this information to processing elements. (JP 2-01)

combat information

Unevaluated data, gathered by or provided directly to the tactical commander which, due to its highly perishable nature or the criticality of the situation, cannot be processed into tactical intelligence in time to satisfy the user's tactical intelligence requirements. (JP 2-01)

combined arms

The synchronized and simultaneous application of all elements of combat power that together achieve an effect greater than if each arm was used separately or sequentially. (ADRP 3-0)

communications intelligence

Technical information and intelligence derived from foreign communications by other than the intended recipients. (JP 2-0)

decisive action

The continuous, simultaneous combinations of offensive, defensive, and stability or defense support of civil authorities tasks. (ADRP 3-0)

defense support of civil authorities

Support provided by United States Federal military forces, Department of Defense civilians, Department of Defense contract personnel, Department of Defense component assets, and National Guard forces (when the Secretary of Defense, in coordination with the governors of the affected states, elects and requests to use those forces in Title 32, United States Code, status) in response to requests for assistance from civil authorities for domestic emergencies, law enforcement support, and other domestic activities, or from qualifying entities for special events. (DODD 3025.18)

defensive task

A task conducted to defeat an enemy attack, gain time, economize forces, and develop conditions favorable for offensive or stability tasks. (ADRP 3-0)

document and media exploitation

The processing, translation, analysis, and dissemination of collected hardcopy documents and electronic media that are under the U.S. Government’s physical control and are not publicly available. (ATP 2-91.8)

electronic intelligence

Technical and geolocation intelligence derived from foreign noncommunications electromagnetic radiations emanating from other than nuclear detonations or radioactive sources. (JP 3-13.1)

foreign instrumentation signals intelligence

A subcategory of signals intelligence consisting of technical information and intelligence derived from the intercept of foreign electromagnetic emissions associated with the testing and operational deployment of non-United States aerospace, surface, and subsurface systems. (JP 2-01)

foreign intelligence entity

Any known or suspected foreign organization, person, or group (public, private, or governmental) that conducts intelligence activities to acquire United States information, block or impair United States intelligence collection, influence United States policy, or disrupt United States systems and programs. The term includes foreign intelligence and security services and international terrorists. (JP 2-01.2)

forensic-enabled intelligence

The intelligence resulting from the integration of scientifically examined materials and other information to establish full characterization, attribution, and the linkage of events, locations, items, signatures, nefarious intent, and persons of interest. (JP 2-0)

***fusion**

(Army) Consolidating, combining, and correlating information together.

geospatial information

Information that identifies the geographic location and characteristics of natural or constructed features and boundaries on the Earth, including: statistical data and information derived from, among other things, remote sensing, mapping, and surveying technologies; and mapping, charting, geodetic data and related products. (JP 2-03).

geospatial intelligence

The exploitation and analysis of imagery and geospatial information to describe, assess, and visually depict physical features and geographically referenced activities on the Earth. Geospatial intelligence consists of imagery, imagery intelligence, and geospatial information. (JP 2-03)

hazard

A condition with the potential to cause injury, illness, or death of personnel; damage to or loss of equipment or property; or mission degradation. (JP 3-33)

***human intelligence**

(Army) The collection by a trained human intelligence collector of foreign information from people and multimedia to identify elements, intentions, composition, strength, dispositions, tactics, equipment, and capabilities.

imagery

A likeness or presentation of any natural or man-made feature or related object or activity, and the positional data acquired at the same time the likeness or representation was acquired, including: products produced by space-based national intelligence reconnaissance systems; and likenesses and presentations produced by satellites, aircraft platforms, unmanned aircraft systems, or other similar means (except that such term does not include handheld or clandestine photography taken by or on behalf of human intelligence collection organizations). (JP 2-03)

imagery intelligence

The technical, geographic, and intelligence information derived through the interpretation or analysis of imagery and collateral materials. (JP 2-03)

information collection

An activity that synchronizes and integrates the planning and employment of sensors and assets as well as the processing, exploitation, and dissemination systems in direct support of current and future operations. (FM 3-55)

intelligence

(1) The product resulting from the collection, processing, integration, evaluation, analysis, and interpretation of available information concerning foreign nations, hostile or potentially hostile forces or elements, or areas of actual or potential operations. (2) The activities that result in the product. (3) The organizations engaged in such activities. (JP 2-0)

***intelligence analysis**

The process by which collected information is evaluated and integrated with existing information to facilitate intelligence production.

intelligence community

All departments or agencies of a government that are concerned with intelligence activity, either in an oversight, managerial, support, or participatory role. (JP 2 0)

***intelligence operations**

(Army) The tasks undertaken by military intelligence units through the intelligence disciplines to obtain information to satisfy validated requirements.

***intelligence reach**

The activity by which intelligence organizations proactively and rapidly access information from, receive support from, and conduct direct collaboration and information sharing with other units and agencies, both within and outside the area of operations, unconstrained by geographic proximity, echelon, or command.

intelligence, surveillance, and reconnaissance

An integrated operations and intelligence activity that synchronizes and integrates the planning and operation of sensors, assets, and processing, exploitation, and dissemination systems in direct support of current and future operations. (JP 2-01)

***intelligence synchronization**

The art of integrating information collection; intelligence processing, exploitation, and dissemination; and intelligence analysis with operations to effectively and efficiently fight for intelligence in support of decision making.

intelligence warfighting function

The related tasks and systems that facilitate understanding the enemy, terrain, weather, civil considerations, and other significant aspects of the operational environment. (ADRP 3-0)

joint operations

Military actions conducted by joint forces and those Service forces employed in specific command relationships with each other, which of themselves, do not establish joint forces. (JP 3-0)

measurement and signature intelligence

Information produced by quantitative and qualitative analysis of physical attributes of targets and events to characterize, locate, and identify targets and events, and derived from specialized, technically derived measurements of physical phenomenon intrinsic to an object or event. (JP 2-0)

offensive task

A task conducted to defeat and destroy enemy forces and seize terrain, resources, and population centers. (ADRP 3-0)

open-source information

(joint) Information that any member of the public could lawfully obtain by request or observation as well as other unclassified information that has limited public distribution or access. (JP 2-0)

open-source intelligence

(DOD) Intelligence that is produced from publicly available information and is collected, exploited, and disseminated in a timely manner to an appropriate audience for the purpose of addressing a specific intelligence requirement. (Public Law 109-163)

operation

A sequence of tactical actions with a common purpose of unifying theme. (JP 1)

operational environment

A composite of the conditions, circumstances, and influences that affect the employment of capabilities and bear on the decisions of the commander. (JP 3-0)

***processing, exploitation, and dissemination**

The execution of the related functions that converts and refines collected data into usable information, distributes the information for further analysis, and, when appropriate, provides combat information to commanders and staffs.

publicly available information

(DOD) Information that has been published or broadcast for public consumption, is available on request to the public, is accessible online or otherwise to the public, is available to the public by subscription or purchase, could be seen or heard by any casual observer, is made available at a meeting open to the public, or is obtained by visiting any place or attending any event that is open to the public. Publicly available information includes information generally available to persons in a military community even though the military community is not open to the civilian general public. (DODM 5240.01)

regionally aligned forces

Those forces that provide a combatant commander at up to joint task force capable headquarters with scalable, tailorable capabilities to enable the combatant commander to shape the environment. They are those Army units assigned to combatant commands, those Army units allocated to a combatant command, and those Army capabilities distributed and prepared by the Army for combatant command regional missions. (FM 3-22)

risk management

The process to identify, assess, and control risks and make decisions that balance risk cost with mission benefits. (JP 3-0)

signals intelligence

Intelligence derived from communications, electronic, and foreign instrumentation signals. (JP 2-0)

stability tasks

Tasks conducted as part of operations outside the United States in coordination with other instruments of national power to maintain or reestablish a safe and secure environment and provide essential governmental services, emergency infrastructure reconstruction, and humanitarian relief. (ADRP 3-07)

technical intelligence

Intelligence derived from the collection, processing, analysis, and exploitation of data and information pertaining to foreign equipment and materiel for the purposes of preventing technological surprise, assessing foreign scientific and technical capabilities, and developing countermeasures designed to neutralize an adversary's technological advantages. (JP 2-0)

threat

Any combination of actors, entities, or forces that have the capability and intent to harm United States forces, United States national interests, or the homeland. (ADRP 3-0)

unified action

The synchronization, coordination, and/or integration of the activities of governmental and nongovernmental entities with military operations to achieve unity of effort. (JP 1)

unified action partners

Those military forces, governmental and nongovernmental organizations, and elements of the private sector with whom Army forces plan, coordinate, synchronize, and integrate during the conduct of operations. (ADRP 3-0)

unified land operations

Simultaneous offensive, defensive, and stability or defense support of civil authorities tasks to seize, retain, and exploit the initiative to shape the operational environment, prevent conflict, consolidate gains, and win our Nation's wars as part of unified action. (ADRP 3-0)

weapons technical intelligence

A subcategory of technical intelligence derived from the technical and forensic collection and exploitation of improvised explosive devices, associated components, improvised weapons, and other systems. (JP 3-15.1)

Preface

FM 2-0 is the Army's keystone manual for military intelligence (MI) doctrine. It describes—

- The fundamentals of intelligence operations.
- The operational environment (OE).
- Intelligence in unified action.
- The Intelligence Battlefield Operating System (BOS).
- Intelligence considerations in strategic readiness.
- The intelligence process.
- MI roles and functions within the context of Army operations.

This manual conforms to the overarching doctrinal precepts presented in FM 3-0.

This manual provides doctrinal guidance for the Intelligence BOS actions in support of commanders and staffs. It also serves as a reference for personnel who are developing doctrine; tactics, techniques, and procedures (TTP); materiel and force structure; and institutional and unit training for intelligence operations.

This manual provides MI guidance for all commanders, staffs, trainers, and MI personnel at all echelons. It forms the foundation for MI and the Intelligence BOS doctrine development, and applies equally to the Active Component (AC), United States Army Reserve (USAR), and Army National Guard (ARNG). It is also intended for commanders and staffs of joint and combined commands, US Naval and Marine Forces, units of the US Air Force, and the military forces of multinational partners.

Headquarters, US Army Training and Doctrine Command is the proponent for this publication. The preparing agency is the US Army Intelligence Center and School. Send written comments and recommendations on DA Form 2028 (Recommended Changes to Publications and Blank Forms) directly to: Commander, ATZS-FDT-D (FM 2-0), 550 Cibeque Street, Fort Huachuca, AZ 85613-7017. Send comments and recommendations by e-mail to *ATZS-FDC-D@hua.army.mil*. Follow the DA Form 2028 format or submit an electronic DA Form 2028.

Unless otherwise stated, masculine nouns and pronouns do not refer exclusively to men.

This manual contains Army tactical task (ART) description taken verbatim from the *Army Universal Task List* (AUTL). ART task descriptions are followed by a reference to FM 7-15 in parentheses and the ART number; for example (See FM 7-15, ART 5.1.1.).

PART ONE

Intelligence in the Operational Environment

Part One discusses MI's role in peace, conflict, and war. Supporting the warfighter with effective intelligence is the primary focus of Military Intelligence. Intelligence provides commanders and decisionmakers with the requisite information facilitating their situational understanding so that they may successfully accomplish their missions in full spectrum operations.

Chapter 1 describes the operational environment and the roles of MI within the operational environment. It introduces the Intelligence BOS, the intelligence tasks, and the intelligence process, which are the mechanisms through which MI supports the warfighter. This chapter also introduces the intelligence disciplines, which are explained in detail in Part Three of this manual.

Chapter 2 describes the interaction of MI within the nation's intelligence community structure, providing an overview of the intelligence community at the national level and the unified action level—joint, multinational, and interagency aspects of full spectrum operations. This chapter also discusses the concepts and components of intelligence reach.

Chapter 1

Intelligence and the Operational Environment

ROLE OF INTELLIGENCE

1-1. The commander requires intelligence about the enemy and the battlespace prior to engaging in operations in order to effectively execute battles, engagements, and other missions across the full spectrum of operations. Intelligence assists the commander in visualizing his battlespace, organizing his forces, and controlling operations to achieve the desired tactical objectives or end-state. Intelligence supports force protection (FP) by alerting the commander to emerging threats and assisting in security operations.

1-2. The unit may need to deal with multiple threats. The commander must understand how current and potential enemies organize, equip, train, employ, and control their forces. Intelligence provides an understanding of the enemy, which assists in planning, preparing, and executing military operations. The commander must also understand his OE and its effects on both his own and enemy operations. The commander receives mission-oriented intelligence on enemy forces and the area of operations (AO) from

the G2/S2. The G2/S2 depends upon the intelligence, surveillance, and reconnaissance (ISR) effort to collect and provide information on the enemy and battlespace.

1-3. One of the most significant contributions that intelligence personnel can accomplish is to accurately predict future enemy events. Although this is an extremely difficult task, predictive intelligence enables the commander and staff to anticipate key enemy events or reactions and develop corresponding plans or counteractions. The most important purpose of intelligence is to influence decisionmaking. Commanders must receive the intelligence, understand it (because it is tailored to the commander's requirements), believe it, and act on it. Through this doctrinal concept, intelligence drives operations.

THE INTELLIGENCE BATTLEFIELD OPERATING SYSTEM

1-4. The Intelligence Battlefield Operating System (BOS) is one of seven battlefield operating systems—intelligence, maneuver, fire support (FS), air defense, mobility/countermobility/survivability, combat service support (CSS), and command and control (C2)—that enable commanders to build, employ, direct, and sustain combat power. The Intelligence BOS is a flexible force of personnel, organizations, and equipment that, individually or collectively, provide commanders with the timely, relevant, and accurate intelligence required to visualize the battlefield, assess the situation, and direct military actions. Additionally, the Intelligence BOS is—

- A complex system that operates worldwide, from "mud-to-space," in support of an operation, to include the ability to leverage theater and national capabilities.
- Cooperation and division of labor internally, higher, lower, adjacent, and across components and the coalition.

1-5. The Intelligence BOS not only includes assets within the MI branch but also includes the assets of all branches or BOS that conduct Intelligence BOS tasks. Every soldier, as a part of a small unit, is a potential information collector and an essential component to help reach situational understanding. Each soldier develops a special level of awareness simply due to exposure to events occurring in the AO and has the opportunity to collect information by observation and interaction with the population.

1-6. Planning and executing military operations will require intelligence regarding the enemy and the battlefield environment. The Intelligence BOS generates intelligence and intelligence products that portray the enemy and aspects of the battlespace. These intelligence products enable the commander to identify potential courses of action (COAs), plan operations, employ forces effectively, employ effective tactics and techniques, and take appropriate security measures.

1-7. The Intelligence BOS is always engaged in supporting the commander in offensive, defensive, stability, and support operations. We must posture the Army for success through hard training, thorough planning, meticulous preparation, and aggressive execution. We can no longer allow a "crawl, walk, run" cycle in preparation for operations. In our current environment we must maintain intelligence readiness to support operations on "no notice." This

support is comprehensive and reaches across full spectrum operations and levels of war to produce the intelligence required to win on the battlefield. A combination of space, aerial, seaborne, and ground-based systems provide the most comprehensive intelligence possible. During force projection operations, the Intelligence BOS supports the commander with accurate and responsive intelligence from predeployment through redeployment.

1-8. The Intelligence BOS architecture provides specific intelligence and communications structures at each echelon from the national level through the tactical level. These structures include intelligence organizations, systems, and procedures for collecting, processing, analyzing, and delivering intelligence and other critical information in a useable form to those who need it, when they need it. Effective communications connectivity and automation are essential components of this architecture.

INTELLIGENCE TASKS (METL)

1-9. The personnel and organizations within the Intelligence BOS conduct four primary intelligence tasks that facilitate the commander's visualization and understanding of the threat and the battlespace. These tasks are interactive and often take place simultaneously. (Refer to FM 7-15 for the complete subordinate task listing.) Figure 1-1 shows these tasks tailored to the commander's needs.

INTELLIGENCE TASKS	COMMANDER'S FOCUS	COMMANDER'S DECISIONS
Support to Situational Understanding - Perform IPB - Perform Situation Development - Provide Intelligence Support to Force Protection - Conduct Police Intelligence Operations	**Plan a mission.** **Execute the operation.** **Secure the force.**	**Which COA will I implement?** **Which enemy actions are expected?**
Support to Strategic Responsiveness - Perform I&W - Ensure Intelligence Readiness - Conduct Area Studies of Foreign Countries - Support Sensitive Site Exploitation	**Orient on contingencies.**	**Should I increase the unit's level of readiness?** **Should I implement the OPLAN?**
Conduct Intelligence, Surveillance, and Reconnaissance - Perform Intelligence Synchronization - Perform ISR Integration - Conduct Tactical Reconnaissance - Conduct Surveillance	**Plan the mission.** **Prepare.** **Execute.** **Assess.**	**Which DPs, HPTs, etc., are linked to the enemy actions?** **Are the assets available and in position to collect on the DPs, HPTs, etc.?** **Have the assets been repositioned for contingency mission?**
Provide Intelligence Support to Effects - Provide Intelligence Support to Targeting - Provide Intelligence Support to IO - Provide Intelligence Support to Combat Assessment	**Destroy/suppress/ neutralize targets.** **Reposition intelligence or attack assets.**	**Is my fire (lethal or non-lethal) and maneuver effective?** **Should I refire the same targets?**

Figure 1-1. Intelligence Tailored to the Commander's Needs.

SUPPORT TO SITUATIONAL UNDERSTANDING

1-10. This task centers on providing information and intelligence to the commander, which facilitates his achieving understanding of the enemy and

the environment. It supports the command's ability to make sound decisions. Support to situational understanding comprises four subtasks: perform intelligence preparation of the battlefield (IPB), perform situation development, provide intelligence support to FP, and conduct police intelligence operations.

Perform Intelligence Preparation of the Battlefield

1-11. The G2/S2 is the staff proponent for IPB. IPB is the staff planning activity undertaken by the entire staff to define and understand the battlespace and the options it presents to friendly and threat forces. IPB includes input from the whole staff. There is only one IPB in each headquarters with inputs from all affected staff cells; they are not separate BOS or staff section IPBs throughout the headquarters. It is a systematic process of analyzing and visualizing the threat and battlespace in a specific geographic area for a specific mission or in anticipation of a specific mission. By applying IPB, the commander and staff gain the information necessary to selectively apply and maximize combat power at critical points in time and space. IPB is most effective when it integrates each staff element's expertise into the final products. To conduct effective IPB, the G2/S2 must—

- Produce IPB products that support the staff's preparation of estimates and the military decision-making process (MDMP).
- Identify characteristics of the AO, including the information environment, that will influence friendly and threat operations.
- Establish the area of interest (AOI) in accordance with the commander's guidance.
- Identify gaps in current intelligence holdings.
- Determine multiple enemy COAs (ECOAs) by employing predictive analysis techniques to anticipate future enemy actions, capabilities, or situations.
- Establish a database that encompasses all relevant data sets within and related to the battlespace.
- Determine the enemy order of battle (OB), doctrine, and TTP. Identify any patterns in enemy behavior or activities.
- Accurately identify and report hazards within the AO, including the medical threat and toxic industrial material (TIM).
- Accurately identify threat capabilities, high-value targets (HVTs), and threat models.
- Integrate IPB information into COA analysis and the MDMP.
- Update IPB products as information becomes available.

Perform Situation Development

1-12. Situation development is a process for analyzing information and producing current intelligence about the enemy and environment during operations. The process helps the intelligence officer recognize and interpret the indicators of enemy intentions, objectives, combat effectiveness, and potential ECOAs. Situation development—

- Confirms or denies threat COAs.
- Provides threat locations.

- Explains what the threat is doing in relation to the friendly force operations.
- Provides an estimate of threat combat effectiveness.

1-13. Through situation development, the intelligence officer is able to quickly identify information gaps, and explain enemy activities in relation to the unit's own operations, thereby assisting the commander in gaining situational understanding. Situation development helps the commander make decisions and execute branches and sequels. This reduces risk and uncertainty in the execution of the plan. The intelligence officer maintains, presents, and disseminates the results of situation development through intelligence input to the common operational picture (COP) and other intelligence products.

Provide Intelligence Support to Force Protection

1-14. Provide intelligence in support of protecting the tactical force's fighting potential so that it can be applied at the appropriate time and place. This task includes the measures the force takes to remain viable and functional by protecting itself from the effects of or recovery from enemy activities. FP consists of those actions taken to prevent or mitigate hostile actions against Department of Defense (DOD) personnel (to include Department of Army [DA] civilians, contractors, uniformed personnel, and family members), resources, facilities, and critical information. These actions—

- Conserve the force's fighting potential for application at the decisive time and place.
- Incorporate coordinated and synchronized offensive and defensive measures.
- Facilitate the effective employment of the joint force while degrading the capabilities of and opportunities for the threat.

1-15. Intelligence to FP consists of monitoring and reporting the activities, intentions, and capabilities of adversarial groups and determining their possible COAs. Detecting the adversary's methods in today's OE requires a higher level of situational understanding, informed by current and precise intelligence. This type of threat drives the need for predictive intelligence based on analysis of focused information from intelligence, law enforcement, and security activities.

1-16. Intelligence analysis in support of FP employs analytical methodologies and tools to provide situational understanding and to predict the adversary's actions. Modified or standard time-event charts, association matrixes, activity matrixes, link diagrams, and overlays are beneficial in monitoring the actions of the adversary. Overlays may include (but are not limited to) threat training camps, organizations, finances, personalities, industrial sites, information systems, decisionmaking infrastructures, specific activities, and locations of previous attacks.

Conduct Police Intelligence Operations

1-17. Police intelligence operations (PIO) are a military police (MP) function that supports, enhances, and contributes to the commander's force protection program, COP, and situational understanding. The PIO function ensures that

information collected during the conduct of other MP functions—maneuver and mobility support, area security, law and order, and internment and resettlement—is provided as input to the intelligence collection effort and turned into action or reports. PIO has three components: (See FM 7-15, ART 1.1.4)

- Collect police information.
- Conduct Police Information Assessment Program (PIAP).
- Develop police intelligence products.

Notes:

US Code, Executive Orders, DOD Directives, and Army Regulations contain specific guidance regarding prohibition on the collection of intelligence information on US citizens, US corporations, and resident aliens. These laws and regulations include criminal penalties for their violation. Any PIO directed against US citizens should undergo competent legal review prior to their initiation.

The inclusion of the PIO task branch in the Intelligence BOS does not change the intelligence process described in this manual.

SUPPORT TO STRATEGIC RESPONSIVENESS

1-18. Intelligence support to strategic responsiveness supports staff planning and preparation by defining the full spectrum of threats, forecasting future threats, and forewarning the commander of enemy actions and intentions. Support to strategic responsiveness consists of four subtasks: Perform I&W, ensure intelligence readiness, conduct area studies of foreign countries, and support sensitive site exploitation. (See FM 7-15, ART 1.2)

Perform Indications and Warnings

1-19. This activity provides the commander with forewarning of enemy actions or intentions; the imminence of threat actions. The intelligence officer develops I&W in order to rapidly alert the commander of events or activities that would change the basic nature of the operations. It enables the commander to quickly reorient the force to unexpected contingencies and shape the battlefield. (See FM 7-15, ART 1.2.1)

1-20. The G2/S2 at the operational and strategic levels develops I&W in order to rapidly alert the commander of events or activities that would change the basic nature of the operations so the commander can initiate the appropriate action in a timely manner. I&W reduce the risk of enemy actions that are counter to planning assumptions. I&W enable the commander to quickly reorient the force to unexpected events and to shape the battlefield by manipulating enemy activities.

Ensure Intelligence Readiness

1-21. Intelligence readiness operations support contingency planning and preparation by developing baseline knowledge of multiple potential threats and operational environments. These operations and related intelligence training activities engage the Intelligence BOS to respond effectively to the

commander's contingency planning intelligence requirements. (See FM 7-15, ART 1.2.2) While still in garrison, intelligence defines the full spectrum of threats and forecasts future threats and dangers. Intelligence readiness operations accomplish the following:

- Provide intelligence to support contingency-based training and staff planning.
- Identify, consider, and evaluate all potential threats to the entire unit.
- Provide a broad understanding of the operational environment of the contingency area, which is developed through continuous exchange of information and intelligence with higher echelon and joint intelligence organizations.

Conduct Area Studies of Foreign Countries

1-22. Study and understand the cultural, social, political, religious, and moral beliefs and attitudes of allied, host nation (HN), or indigenous forces to assist in accomplishing goals and objectives. (See FM 7-15, ART 1.2.3)

Note: The inclusion of this task does not change the support to strategic responsiveness provided by MI organizations described in this manual.

Support Sensitive Site Exploitation

1-23. Sensitive site exploitation consists of a related series of activities inside a sensitive site captured from an adversary. A sensitive site is a designated, geographically limited area with special military, diplomatic, economic, or information sensitivity for the United States. This includes factories with technical data on enemy weapon systems, war crimes sites, critical hostile government facilities, areas suspected of containing persons of high rank in a hostile government or organization, terrorist money laundering, and document storage areas for secret police forces. These activities exploit personnel, documents, electronic data, and material captured at the site, while neutralizing any threat posed by the site or its contents. While the physical process of exploiting the sensitive site begins at the site itself, full exploitation may involve teams of experts located around the world. (See FM 7-15, ART 1.2.4)

Note: The inclusion of this task does not change the support to strategic responsiveness provided by MI organizations described in this manual.

CONDUCT INTELLIGENCE, SURVEILLANCE, AND RECONNAISSANCE

1-24. With staff participation, the intelligence officer synchronizes intelligence support to the ISR effort by focusing the collection, processing, analysis, and intelligence products on the critical needs of the commander. The operations officer, in coordination with the intelligence officer, tasks and directs the available ISR assets to answer the commander's critical information requirements (CCIRs). Through various detection methods and systematic observation, reconnaissance and surveillance obtains the required information. A continuous process, this task has four subtasks: perform intelligence synchronization, perform ISR integration, conduct tactical reconnaissance, and conduct surveillance. (See FM 7-15, ART 1.3, and FM 3-90).

Perform Intelligence Synchronization

1-25. The intelligence officer, with staff participation, synchronizes the entire collection effort to include all assets the commander controls, assets of lateral units and higher echelon units and organizations, and intelligence reach to answer the commander's priority intelligence requirements (PIRs) and information requirements (IRs). (See FM 7-15, ART 1.3.1)

1-26. The intelligence officer, with staff participation, supports the G3/S3 in orchestrating the entire ISR effort to include all assets the commander controls, assets of lateral units and higher echelon units and organizations, and intelligence reach to answer the CCIRs (PIRs and friendly force information requirements [FFIRs]) and other intelligence requirements. Intelligence synchronization activities include the following:

- Conducting requirements management (RM): anticipate, develop, analyze, validate, and prioritize intelligence requirements. Recommend PIRs to the commander. Manage the commander's intelligence requirements, requests for information (RFIs) from subordinate and lateral organizations, and tasks from higher headquarters. Eliminate satisfied requirements and add new requirements as necessary.
- Developing indicators.
- Developing specific IRs (specific information requirements [SIRs]).
- Converting the SIRs into intelligence tasks or ISR tasks. (See Figure 1-2 for the ISR task development process.) The S2/G2 assigns intelligence production and reach tasks to subordinate intelligence ele-ments or personnel, submits RFIs to higher and lateral echelons, and coordinates with (or assists) the G3/S3 to develop and assign ISR tasks.
- Comparing the ISR tasks to the capabilities and limitations of the available ISR assets (in coordination with the operations officer).
- Forwarding SIRs that cannot be answered by available assets to higher or lateral organizations as RFIs.
- Assessing collection asset reporting and intelligence production to evaluate the effectiveness of the ISR effort.
- Maintaining situational understanding to identify gaps in coverage and to identify the need to cue or redirect ISR assets.
- Updating the intelligence synchronization plan. The G2/S2 manages and updates the intelligence synchronization plan as PIRs are answered and new requirements arise.

1-27. **Intelligence Synchronization Considerations.** The G2/S2 gen-erally follows six considerations in planning intelligence synchronization and ISR activities: anticipate, integrate, prioritize, balance, control, and reach. Refer to FM 2-01 for more information regarding intelligence synchro-nization.

- Anticipate. The intelligence staff must recognize when and where to shift collection or identify new intelligence requirements. The overall intent of this principle is to identify a new or adjust an existing requirement and present it to the commander for approval before waiting for the commander or his staff to identify it.

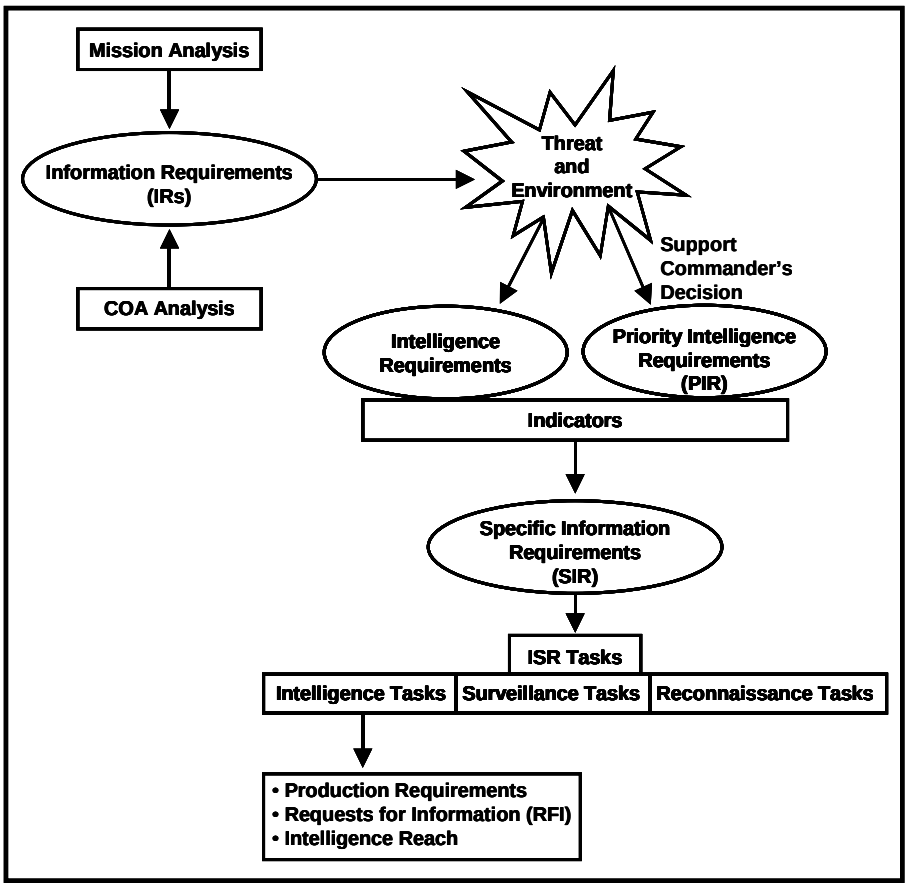

Figure 1-2. ISR Task Development Process.

- Integrate. The intelligence staff must be fully and continuously integrated into the unit's orders production and planning activities to ensure early identification of intelligence requirements. Early and continuous consideration of collection factors enhances the unit's ability to direct collection assets in a timely manner, ensures thorough planning, and increases flexibility in selecting assets.
- Prioritize. Prioritize each intelligence requirement based on its importance in supporting the commander's intent and decisions. Prioritization, based on the commander's guidance and the current situation, ensures that limited ISR assets and resources are directed against the most critical requirements.
- Balance. ISR capabilities complement each other. The intelligence staff should resist favoring or becoming too reliant on a particular unit, discipline, or system. Balance is simply planning redundancy, when required, eliminating redundancy when not desired, and ensuring an appropriate mix of ISR assets or types. The intelligence synchronization matrix (ISM) is useful in determining or evaluating balance.
- Control. To ensure timely and effective responses to intelligence requirements, a unit should first use ISR assets it controls. These

assets usually are more responsive to their respective commander and also serve to lessen the burden on the ISR assets of other units, agencies, and organizations.

- Reach. Although usually not as responsive as a unit's own assets, intelligence reach may be the only way to satisfy an intelligence requirement. If at all possible, one should not depend solely on intelligence reach to answer a PIR.

1-28. **Develop IRs**. The intelligence staff develops a prioritized list of what information needs to be collected and produced into intelligence. Additionally, the intelligence staff dynamically updates and adjusts those requirements in response to mission adjustments and changes. This list is placed against a latest time intelligence is of value to ensure intelligence and information are reported to meet operational requirements. (See FM 7-15, ART 1.3.1) Figure 1-3 shows a comparison of IR, PIR, and intelligence requirements.

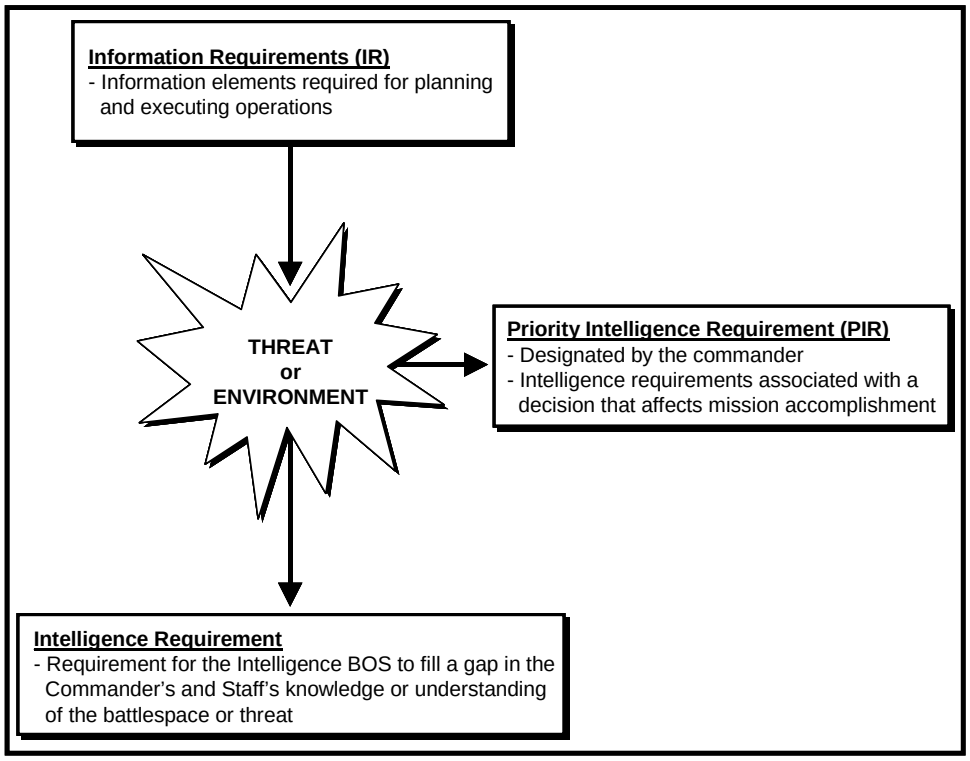

Figure 1-3. IR, PIR, and Intelligence Requirements Comparison

1-29. An effective discussion of ISR has to include an understanding of the CCIRs. The CCIRs are elements of information required by commanders that directly affect decisionmaking and dictate the successful execution of military operations. The commander decides what information is critical based on his experience, the mission, the higher commander's intent, and the staff's input (initial IPB, information, intelligence, and recommendations). Refer to FM 3-0 for more information regarding CCIRs.

1-30. Based on the CCIRs, two types of supporting IRs are generated: PIRs and FFIRs. However, commanders may determine that they need to know whether one or more essential elements of friendly information (EEFI) have been compromised or that the enemy is collecting against a designated EEFI. In those cases, commanders may designate that question as one of their CCIRs. Figure 1-4 shows the CCIR composition.

1-31. IRs are all of the information elements required by the commander and his staff for the successful planning and execution of operations; that is, all elements necessary to address the factors of mission, enemy, terrain and weather, troops and support available, time available, civil considerations (METT-TC). Vetting by the commander or his designated represen-tative turns an IR into either a PIR or an intelligence requirement. IRs are developed during COA analysis based on the factors of METT-TC.

1-32. PIRs are those intelligence requirements for which a commander has an anticipated and stated priority in his task of planning and decisionmaking. PIRs are associated with a decision based on an enemy action or inaction or the battlespace that will affect the overall success of the commander's mission. **The commander designates intelligence require-ments tied directly to his decisions as CCIR (PIR and FFIR)**. Answers to the PIRs help produce intelligence essential to the commander's sit-uational understanding and decisionmaking. For information on PIR devel-opment, see FM 2-01.

1-33. The G2/S2 recommends to the commander those IRs produced during the MDMP that meet the criteria for PIR. They do not become CCIR (PIR and FFIR) until approved by the commander. Additionally, The commander may unilaterally designate PIRs. The IRs that are not designated by the commander as PIRs become intelligence requirements. The intelligence requirement is a gap in the command's knowledge or understanding of the battlespace or threat that the Intelligence BOS must fill.

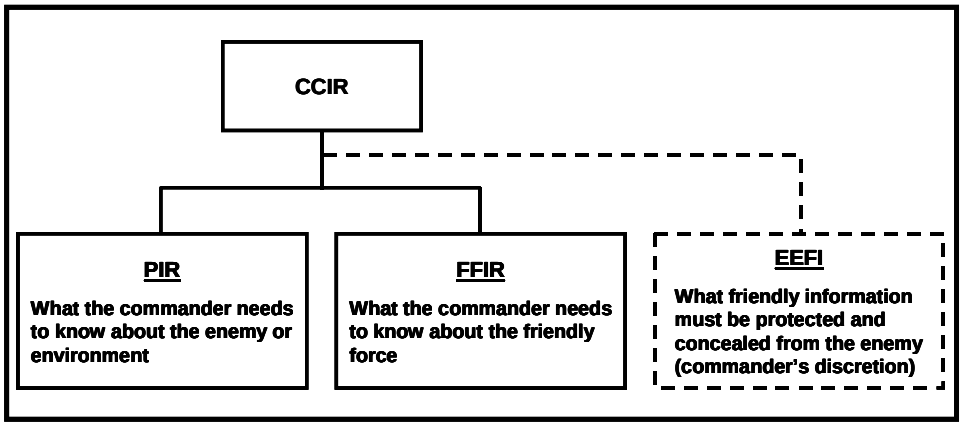

Figure 1-4. Commander's Critical Information Requirements Composition.

1-34. The G3/S3 then tasks the unit's assets to answer both the PIR and intelligence requirements through the ISR plan. PIR should—

- Ask only one question.
- Support a decision.
- Identify a specific fact, event, activity (or absence thereof) which can be collected.
- If linked to an ECOA, indicate an ECOA prior to, or as early as possible in, its implementation.
- Indicate the latest time the information is of value (LTIOV). The LTIOV is the absolute latest time the information can be used by the commander in making the decision the PIR supports. The LTIOV can be linked to time, an event, or a point in the battle or operation.

1-35. **Friendly Force IRs.** The staff also develops FFIRs which, when answered, provide friendly force information that the commander and staff need to achieve situational understanding and to make decisions.

1-36. **Essential Elements of Friendly Information**. EEFI establish information to protect, not information to obtain. However, commanders may determine that they need to know whether one or more EEFI have been compromised or that the enemy is collecting against a designated EEFI. In those cases, commanders may designate that question as one of their CCIRs, which generates PIRs and/or FFIRs. For example, a commander may determine that if the enemy discovers the location and movement of the friendly reserve, the operation is at risk. In this case, the location and movement of the friendly reserve are EEFI. He designates determining whether the enemy has discovered the location and movement of the friendly reserve as one of his CCIR. That CCIR, in turn, generates PIR and FFIR to support staff actions in determining whether the EEFI has been compromised.

1-37. **Develop the Intelligence Synchronization Plan.** The entire unit staff develops their IRs and determines how best to satisfy them. The staff uses reconnaissance and surveillance assets to collect information. The intelligence synchronization plan includes all assets that the operations officer can task or request and coordination mechanisms to ensure adequate coverage of the AOIs. (See FM 7-15, ART 1.3.1.2)

1-38. The intelligence synchronization plan, often presented in a matrix format as an ISM, aids in synchronizing the entire ISR effort with the overall operation and the commander's decisions and/or decision points (DPs). The intelligence synchronization plan is often produced in conjunction with the ISR plan. However, before performing intelligence synchronization and finalizing the intelligence synchronization plan, the G2/S2 must have—

- The CCIR (PIR and FFIR).
- A prioritized list of the remaining intelligence requirements.
- Evaluated ISR assets and resources.
- All of the assigned ISR tasks.

Perform ISR Integration

1-39. The operations officer, in coordination with the intelligence officer and other staff members, orchestrates the tasking and directing of available ISR

assets to answer the CCIR. The operations officer, with input from the intelligence officer, develops tasks from the SIRs which coincide with the capabilities and limitations of the available ISR assets and the latest time information is of value (LTIOV). Intelligence requirements are identified, prioritized, and validated and an ISR plan is developed and synchronized with the scheme of maneuver. (See FM 7-15, ART 1.3.2, and FM 3-90)

1-40. The G3/S3, in coordination with the G2/S2 and other staff members, orchestrates the tasking and directing of available ISR assets to answer the CCIRs (PIRs and FFIRs) and IRs. The result of this process is the forming of the ISR plan. The ISR plan provides a list of all the ISR tasks to be accomplished. The G2/S2 and the G3/S3 develop tasks from the SIRs. These tasks are then assigned based on the capabilities and limitations of the available ISR assets and the LTIOV.

1-41. **Develop the ISR Plan.** The operations officer is responsible for developing the ISR plan. The entire unit staff analyzes each requirement to determine how best to satisfy it. The staff will receive orders and RFIs from both subordinate and adjacent units and higher headquarters. The ISR plan includes all assets that the operations officer can task or request and coordination mechanisms to ensure adequate coverage of the area of interest. (See FM 7-15, ART 1.3.2.1, and FM 3-90)

1-42. **The ISR Plan**. The ISR plan is usually produced as the ISR Annex to an OPORD (Annex L, Intelligence Surveillance, and Reconnaissance). Refer to FM 5-0 for specific and authoritative information on the ISR Annex. ISR is a continuous combined arms effort led by the operations and intelligence staffs in coordination with the entire staff that sets reconnaissance and surveillance in motion. The PIRs and other intelligence requirements drive the ISR effort. The commander takes every opportunity to improve his situational understanding and the fidelity of the COP about the enemy and terrain through the deployment of his ISR assets. Commanders integrate reconnaissance and surveillance to form an integrated ISR plan that capitalizes on their different capabilities. The ISR plan is often the most important part of providing information and intelligence that contributes to answering the CCIRs. For the G2/S2, an effective ISR plan is critical in answering the PIR. Also see FM 3-55 for more information on the ISR plan.

1-43. The ISR plan is not an MI-specific product—the G3/S3 is the staff proponent of the ISR plan— it is an integrated staff product executed by the unit at the direction of the commander. The G2/S2, however, must maintain his situational understanding in order to recommend to the commander and G3/S3 changes or further development of the ISR plan. Based on the initial IPB and CCIRs, the staff—primarily the G2/S2—identifies gaps in the intelligence effort and develops an initial ISR plan based on available ISR assets. The G3/S3 turns this into an initial ISR Annex that tasks ISR assets as soon as possible to begin the collection effort.

1-44. The G3/S3, assisted by the G2/S2, uses the ISR plan to task and direct the available ISR assets to answer the CCIRs (PIRs and FFIRs) and intelligence requirements. Conversely, the staff revises the plan as other intelligence gaps are identified if the information is required to fulfill the

CCIRs or in anticipation of future intelligence requirements. With staff participation, the G2/S2 intelligence officer synchronizes the ISR effort through a complementary product to the ISR plan—the intelligence synchronization plan.

1-45. **Execute and Update the ISR Plan**. The operations officer updates the ISR plan based on information he receives from the intelligence officer. The operations officer is the integrator and manager of the ISR effort through an integrated staff process and procedures. As PIRs are answered and new information requirements arise, the intelligence officer updates intelligence synchronization requirements and provides the new input to the operations officer who updates the ISR plan. He works closely with all staff elements to ensure the unit's organic collectors receive appropriate taskings. This ISR reflects an integrated collection strategy and employment, production and dissemination scheme that will effectively answer the commander's PIR. (See FM 7-15, ART 1.3.2.2, and FM 3-90)

Conduct Tactical Reconnaissance

1-46. To obtain, by visual observation or other detection methods, such as signals, imagery, measurement of signature or other technical characteristics, human interaction and other detection methods about the activities and resources of an enemy or potential enemy, or to secure data concerning the meteorological, hydrographic, or geographic characteristics and the indigenous population of a particular area. This task includes the conduct of NBC reconnaissance and the tactical aspects of SOF special reconnaissance. The five subtasks are—

- Conduct a Zone Reconnaissance.
- Conduct an Area Reconnaissance.
- Conduct a Reconnaissance in Force.
- Conduct a Route Reconnaissance.
- Conduct a Reconnaissance Patrol.

Note: This task branch includes techniques by which ART 1.1.4.1 (Collect Police Information) may be performed. (FM 7-15)

1-47. Reconnaissance is a mission undertaken to obtain by visual observation or other detection methods, information about the activities and resources of an enemy or potential enemy, and about the meteorological, hydrographic, or geographic characteristics of an AO. MI personnel and organizations can conduct reconnaissance through obtaining information derived from signals, imagery, measurement of signatures, technical characteristics, human interaction, and other detection methods. When performing reconnaissance, it is important to—

- Orient the reconnaissance asset on the named area of interest (NAI) and/or reconnaissance objective in a timely manner.
- Report all information rapidly and accurately.
- Complete the reconnaissance mission not later than (NLT) the time specified in the order.
- Answer the requirement that prompted the reconnaissance task.

Conduct Surveillance

1-48. To systematically observe the airspace, surface, or subsurface areas, places, persons, or things in the AO by visual, aural (audio), electronic, photographic, or other means. Other means may include but are not limited to space-based systems, and using special NBC, artillery, engineer, SOF, and air defense equipment. (See FM 7-15, ART 1.3.4, and FM 3-90)

Note: This task is a technique by which ART 1.1.4.1 (Collect Police Information) may be performed.

1-49. Conducting surveillance is systematically observing the airspace, surface, or subsurface areas, places, persons, or things in the AO by visual, aural, electronic, photographic, or other means. Surveillance activities include—

- Orienting the surveillance asset on the NAI and/or the surveillance objective in a timely manner.
- Reporting all information rapidly and accurately.
- Completing the surveillance mission NLT the time specified in the order.
- Answering the requirement that prompted the surveillance task.

PROVIDE INTELLIGENCE SUPPORT TO EFFECTS

1-50. The task of providing the commander information and intelligence support for targeting of the threat's forces, threat organizations, units and systems through lethal and non-lethal fires to include electronic attack and information operations. This task includes three subtasks: provide intelligence support to targeting, provide intelligence support to information operations, and provide intelligence support to combat assessment. (See FM 7-15, ART 1.4)

Provide Intelligence Support to Targeting

1-51. The intelligence officer, supported by the entire staff, provides the commander information and intelligence support for targeting the threat's forces and systems through employment of direct, indirect lethal, and non-lethal fires. It includes identification of threat capabilities and limitations. The Intelligence BOS plays a crucial role by providing intelligence throughout the steps of the targeting process: decide, detect, deliver, assess. Support to targeting includes identifying threat capabilities and limitations. The G2/S2 supports the unit's lethal and non-lethal targeting effort through target development, target acquisition (TA), electronic warfare (EW), and combat assessment. This task has two subtasks:

- *Provide Intelligence Support to Target Development* is the systematic analysis of the enemy forces and operations to determine HVTs, systems, and system components for potential attack through maneuver, fires, or information.
- *Provide Intelligence Support to Target Detection* establishes procedures for dissemination of targeting information. The targeting team develops the sensor/attack system matrix to determine the sensor

required to detect and locate targets. The intelligence officer places the following requirements into the integrated ISR plan.

- Requires reconnaissance and surveillance operations to identify, locate, and track high-payoff targets (HPTs) for delivery of lethal or non-lethal effects.
- Includes employing fires, offensive IO, and other attack capabilities against enemy C2 systems as part of the unit's FS plan and IO objectives.

Provide Intelligence Support to Information Operations

1-52. IO are actions taken to affect adversary information, influence other's decisionmaking processes and information systems while protecting one's own information and information systems. Overall operational continuity and mission success requires close, mutual coordination and synchronization of intelligence plans and operations with IO elements and related activities. Refer to Appendix A, this manual, for more information. This task has three subordinate tasks: (See FM 7-15, ART 1.4.2)

- Provide Intelligence Support to Offensive IO.
- Provide Intelligence Support to Defensive IO.
- Provide Intelligence Support to Activities Related to IO.

Provide Intelligence Support to Combat Assessment

1-53. Combat assessment is the determination of the overall effectiveness of force employment during military operations. The objective of combat assessment is to identify recommendations for the course of military operations. It answers the question, "Were the objectives met by force employment?" Although the assessment is primarily an intelligence responsibility, it requires input from and coordination with operations and fire support staffs. Combat assessment consists of conducting physical damage, functional damage, and target system assessments. (See FM 7-15, ART 1.4.3)

1-54. The staff determines how combat assessment relates to a specific target by conducting physical damage, functional damage, and target system assessments.

- Conduct Physical Damage Assessment (PDA). A PDA is an estimate of the extent of physical damage to a target based upon observed or interpreted damage. This post-attack target analysis is a coordinated effort among all units.
- Conduct Functional Damage Assessment (FDA). The FDA estimates the remaining functional or operational capability of a targeted facility or object. The staff bases FDA on the assessed physical damage and estimates of the threat's ability to recuperate (to include the time required to resume normal operations). Multiple echelons typically conduct this all-source analysis. The targeting or combat assessment cell integrates the initial target analyses with other sources, including intelligence, and then compares the original objective with the current status of the target to determine if the objective has been met.
- Conduct Target System Assessment (TSA). The TSA is an estimate of the overall impact of force employment against an adversary's target

system. The unit, supported by higher echelon assets, normally conducts this assessment. The analyst combines all combat assessment reporting on functional damage to targets within a target system and assesses the overall impact on that system's capabilities. This process lays the groundwork for future recommendations for military operations in support of operational objectives.

1-55. **Munitions Effects Assessment (MEA)**. MEA takes place concur-rently and interactively with combat assessment since the same signatures used to determine the level of physical damage also give clues to munitions effectiveness. MEA is primarily the responsibility of operations and FS personnel, with input from the G2/S2. After the same weapon is used to attack several targets of a specific type, MEA should be accomplished to evaluate weapon performance. MEA analysts seek to identify through systematic trend analysis any deficiencies in weapon system and munitions performance or combat tactics by answering the question, "Did the weapons employed perform as expected?" Using a variety of input (targeting analysts, imagery analysts, structural engineers, and mission planners) analysts prepare a report assessing munitions performance. If combat troops capture attacked targets, it is then possible to collect detailed information on the target. Reports should detail weapon performance against specified target types. This information could have a crucial impact on future operations.

1-56. **Re-attack Recommendation**. Re-attack recommendations follow directly from both battle damage assessment (BDA) and MEA efforts. Basically re-attack recommendations answer the question, "Have we achieved the desired effects against our targeted objectives?" Evolving objectives, target selection, timing, tactics, weapons, vulnerabilities, and munitions are all factors in the new recommendations, combining both operations and intelligence functions.

1-57. **Targeting Meeting**. The role of the G2/S2 in targeting meetings is critical to ensuring intelligence supports the targeting process. The G2/S2 must come to the targeting meeting prepared. Additionally, the G2/S2 must understand the steps of the targeting process and tailor the intelligence products and G2/S2 participation according to the targeting process steps of: decide, detect, deliver, and assess.

1-58. There are two major areas in which the G2/S2 must prepare in order to support the targeting meeting.

- Analysis: Determine what the enemy is doing (current situation) and anticipated threat models; ECOA situation templates, ECOA sketches and statements, HVTs, and other associated products.
- IPB Products: Updated from the initial IPB effort, including analytical results (see above bullet), and tailored to the targeting requirements.

1-59. **Decide**. At the targeting meeting, the G2/S2 should be prepared to do the following:

- Brief the current and projected future enemy situation with an event template.

- Brief any combat assessments.
- Brief HVTs for potential selection of HPTs.
- Brief the current PIR portion of CCIRs, the PIRs of the CCIRs for the next phase or in accordance with the same timeframe of the targeting meeting.
- Brief the current ISM or intelligence synchronization plan.
- Participate in wargaming.
- Refine the initial ISR plan (in conjunction with the FS and G3/S3 representatives).

1-60. **Detect**. Based on information from the decide portion of the targeting meeting, the G2/S2 should be prepared to do the following:

- Identify specific ISR assets.
- Develop IRs and propose pertinent IRs to the commander for designation as PIRs.
- Complete the initial ISR plan; ensure it addresses the HPTs.

1-61. **Electronic Warfare**. EW provides targeting information to the commander based on transmitter location data. There are three major subdivisions within EW: electronic support (ES), electronic protection (EP), and electronic attack (EA).

- ES – Also referred to as electronic warfare support (EWS) in JP 1-02, involves actions to search for, intercept, identify, and locate or localize sources of intentional and unintentional radiated electromagnetic energy. In addition to supporting the overall ISR effort, ES is needed to produce intelligence required to support EA missions.
- EP – Involves passive and active means taken to protect personnel, facilities, and equipment from any effects of friendly or enemy employment of EW that degrades, neutralizes, or destroys friendly combat capabilities.
- EA – Involves the use of electromagnetic energy, directed energy, or anti-radiation weapons to attack personnel, facilities, or equipment with the intent of degrading, neutralizing, or destroying enemy combat capability and is considered a form of fires. EA includes actions taken to prevent or reduce an enemy's effective use of the electromagnetic spectrum (EMS), such as jamming and electromagnetic deception.

1-62. **Deliver**. The G2/S2 should be prepared to do the following:

- Brief how the Intelligence BOS will work to detect and track the target through the entire targeting process.
- Brief the implementation of the intelligence synchronization and ISR plans, including the LTIOV and communications structure.

1-63. **Assess**. Depending on the factors of METT-TC and the PIRs, the same ISR assets that detect and track the targets may be required to support combat assessments in order to determine if re-attack is required. Conversely, if re-attack is a decision that the commander will make based upon the

effects on the enemy, combat assessment should be reflected in the PIR, and supported in the corresponding ISR plan.

THE OPERATIONAL ENVIRONMENT

1-64. US military forces face a dynamic, multidimensional, and increasingly interconnected global OE. The world situation is complicated and split into many different factions with many possible conflicts. In addition, the characteristics of warfare continue to change as the nature of conflict changes. Different threats require intelligence operations to adapt to the ever-changing OE. This necessitates that all MI personnel maintain or very quickly build cultural awareness (to a high level of detail) specific to the regional and local environment in the AO. These conditions greatly affect MI, as they increase the degree of difficulty and complexity in determining not only who constitutes the enemy but also which of the many possible ECOAs the enemy could implement.

1-65. If the US can dominate an adversary through its size or technological, organizational, and strategic capabilities, the adversary will resort to unconventional and adaptive ways and means to achieve his ends, which may themselves change at times. MI personnel (uniformed and civilian) must also adapt their operations and thinking to understand and predict or anticipate the enemy's next move. MI personnel must remain vigilant, as any likely adversary is a thinking, adaptive threat with extensive resources which he cultivates through ingenuity, purchase of niche capabilities, and the support of his allies. For example, the adversary—

- May use tactics designed to inflict large numbers of military or civilian casualties or attack high-profile persons.
- May target and destroy subsystems of a BOS individually or collectively.
- May use the local civilian population for cover and support.
- May use the characteristics of the natural environment, industry, and enterprise against our forces in unexpected manners.
- May study every aspect of US doctrine, training, and technological capabilities.
- May quickly overcome any countermeasures and subsequent countermeasures that US forces emplace to deter his activities.
- May employ many personnel to conduct reconnaissance as well as those in the local civilian population who support the threat.
- May attack US information, information systems, and decisionmaking infrastructures in order to discredit or provoke the US, weaken alliances and coalitions, erode public support, incite nation-state and/or international condemnation, and degrade US C2 and/or ISR capabilities.

1-66. The overall ability of US forces to defeat such adversaries depends upon the ability of MI personnel to analyze the current and future methods and capabilities of potential adversaries and incorporate those considerations into training, planning, and executing military operations. The OE will continue to change, thus the US military forces and MI must evolve to provide intelligence.

DIMENSIONS OF THE OPERATIONAL ENVIRONMENT

1-67. The OE has six dimensions: threat, political, unified action, land combat operations, information, and technology. Each affects how Army forces (ARFOR) and MI units plan, prepare, execute, and assess military operations. (See FM 3-0, Chapter 1.)

THREAT

1-68. Extremism, ethnic disputes, poverty, and religious rivalries create unstable conditions within and among states. Rarely are only two sides involved in modern conflicts. More often, one ethno-national group opposes other groups with conflicting interests. This poses a significantly more complex set of enemy or potential adversaries (threat), entities that MI personnel must understand.

1-69. Adversaries will try to create conditions to defeat US operations and to slow the advance of US forces. They will use complex terrain, urban environments, and force dispersal methods—similar to those used by enemies the US has faced before—to offset US advantages. These methods increase the difficulty for MI personnel to identify or locate the enemy's HVTs and may result in US forces' wasting precision weapons on relatively unimportant assets. MI personnel must be aware of the following general concepts that the enemy may use against US forces:

- Conduct force-oriented operations.
- Inflict unacceptable casualties.
- Optimize the use of standoff weaponry and techniques.
- Attempt to control the tempo.
- Create conditions to defeat US forcible entry operations.
- Transition to a defensive framework that avoids decisive battle, preserves capability, and prolongs the conflict. If US forces deploy, the threat may use terrorist and/or information warfare tactics and other measures to erode public support, erode or fracture alliance or multinational cohesion, and the will to fight.
- Conduct effective ISR.
- Use weapons of mass destruction (WMD) to conduct sophisticated ambushes.
- Attack key operating systems or inflict mass casualties within and outside the theater of operations.
- Employ TIM or other toxic substances or pollutants in unconventional manners.
- Use terrain and urban areas to conceal or shield mechanized and armored units. The threat may concentrate and disperse them as opportunities allow, particularly maneuvering forces during periods of reduced exposure to US ISR technology.
- Use effective camouflage and deception techniques.
- Form coalitions against the US.
- Acquire or modify advanced technology systems to create surprise and limited duration superiority in specific areas.

1-70. Additionally, MI personnel must be aware of how to produce intelligence on the many transnational groups that conduct a range of activities that threaten US interests and citizens at home and abroad. Such activities include terrorism, information warfare, illegal drug trafficking, illicit arms and strategic material trafficking, international organized crime, piracy, and deliberate environmental damage.

POLITICAL

1-71. The national security strategy defines how the US meets challenges in the complex and dynamic global environment. It establishes broad strategic guidance for advancing US interests through the instruments of national power. The military components of the National Security Strategy and the National Military Strategy focus on using military force as an instrument of national power. The President and the Secretary of Defense (formerly referred to as National Command Authorities [NCA]) combine using military force with accurate intelligence to preserve, protect, and advance US interests. Translating political decisions into missions depends on informed and candid assessments.

UNIFIED ACTION

1-72. Unified action is a broad generic term that describes the wide scope of actions (including the synchronization of activities with governmental and non-governmental agencies) taking place within unified commands, subordinate unified commands, or joint task forces under the overall direction of the commanders of those commands. (See Chapter 2.) The "Mud to Space" intelligence structure calls for MI to act as part of a fully interoperable and integrated joint intelligence structure. Consequently, the employment of MI in campaigns and major operations must be viewed from a joint perspective. Joint force commanders (JFCs) synchronize the complementary capabilities of the service components that comprise the joint force. They exploit service intelligence capabilities and create an effective joint intelligence team. Often, ARFOR intelligence assets work with multinational and interagency partners to accomplish their missions. Ideally, multinational and interagency intelligence partners provide cultures, perspectives, and capabilities that reinforce and complement Army MI strengths and capabilities. Close intelligence coordination is the foundation of successful unified action.

LAND COMBAT OPERATIONS

1-73. Land combat continues to be the salient feature of conflict. It usually involves destroying or defeating enemy forces or taking land objectives that reduce the enemy's effectiveness or will to fight. The axiom "intelligence drives operations" continues to be true; operations and intelligence are complementary. Four characteristics distinguish land combat. The support MI provides is covered in each:

- Scope. Intelligence considers and strives to understand an enemy throughout the depth of an operational area. Commanders rely on intelligence in order to use maneuver, fires, and other elements of combat power to defeat or destroy enemy forces.

- Duration. Intelligence assets routinely conduct missions prior to, during, and after the commitment of land combat forces. Intelligence is always engaged.
- Terrain. Intelligence missions occur among a complex variety of natural and manmade features. Employing intelligence assets in the complexity of the ground environment requires thorough planning. Employing intelligence assets must account for the visibility and clutter of the terrain and the effects of weather and climate.
- Permanence. MI forces are integrated with, or assigned to, land combat forces as they seize or secure ground. MI assets with these land combat forces make permanent the temporary intelligence capabilities of other operations.

INFORMATION

1-74. Many intelligence operations take place within an information environment that is largely outside the control of military forces. The information environment is the aggregate of individuals, organizations, and systems that collect, process, store, display, and disseminate information; also included is the information itself. (See JP 3-13 and FM 3-13). National, international, and non-state actors use the information environment to collect, process, and disseminate information. The media's use of real-time technology affects public opinion, both in the US and abroad, and alters the conduct and perceived legitimacy of military operations. Now, more than ever, every soldier is a potential representative of America to a global audience. The adaptive thinking adversary will often seek to exploit the information environment in an effort to counter, weaken, and defeat the US. Information warfare will be directed against the US and US interests. While the level of sophistication of such attacks may vary, they nonetheless will take place and over time will take their toll.

1-75. Historically, information superiority has enabled decisive ARFOR operations. Information superiority enables ARFOR to see first, understand the situation more quickly and accurately, and act faster than their adversaries. Information superiority, which is derived from the effective synchronization of ISR, information management (IM), and IO, is an operational advantage that results in friendly forces gaining and retaining the initiative. Effective ISR operations and IM identify the information commanders require, collect it, and get it to them when they need it. Offensive IO degrade an adversary's will to resist and ability to fight while simultaneously denying him relevant friendly force information. Defensive IO protect friendly information and C2 systems. Information superiority means commanders receive accurate and timely information that enables them to make better decisions and act faster than their adversaries.

TECHNOLOGY

1-76. Technology greatly enables intelligence operations. It enhances the intelligence leader, unit, and soldier performance and affects intelligence operations in full spectrum operations. Intelligence system interoperability is a major concern for the G2/S2, commanders, and staffs as they plan, prepare forces, and weigh employment options. Quality intelligence provided by

advanced ISR capabilities and communications, coupled with sound IM, assists commanders in making decisions.

1-77. Battle command benefits from the ability of modern intelligence and telecommunications systems to provide intelligence products faster and more precisely. Technology improves all facets of intelligence, thereby increasing the potential for mission accomplishment. MI personnel must be able to operate their respective systems at their maximum potential. An MI soldier who can use technology to improve the quality, timeliness, and method of presentation of intelligence products provided to the commander is extremely valuable.

1-78. In all operations, MI personnel must determine the extent to which their adversaries possess at least some advanced weaponry. Their weaponry may range from a computer connected to the Internet to WMD. Adversaries may also possess information-based technologies or capabilities, such as satellite imagery, night vision devices (NVDs), or precision-delivery systems. The potential for asymmetric threats puts a premium on IPB and the other intelligence tasks, to include situation development and providing I&W. Operational success requires identifying and evaluating enemy capabilities (strengths and vulnerabilities), intentions, and potential ECOAs.

CRITICAL VARIABLES OF THE CONTEMPORARY OPERATIONAL ENVIRONMENT

1-79. The contemporary operational environment (COE) is the operational environment that exists in the world today and is expected to exist until a peer competitor arises. There are eleven critical variables, as shown in Figure 1-5, that facilitate understanding the threat and define the OE. These variables are interrelated, and different variables will be more or less important in relation to each other in different situations. Only by studying and understanding these variables—and incorporating them into training—will the US Army be able to both keep adversaries from gaining an operational advantage against the US and to find ways to use them to our own advantage. Figure 1-5 not only depicts the critical variable of the OE but it also shows that they are linked to all the dimensions of the OE.

NATURE AND STABILITY OF THE STATE

1-80. This variable refers to how strong or weak a country is. It is important to determine where the real strength of the state lies; it may be in the political leadership, the military, the police, or some other element of the population—or in some combination of these factors. Intelligence will provide the information crucial in defining the battlefield environment and allow US forces to better understand all aspects of the AO, the nature of the military campaign, and the true aims of an enemy campaign, operation, or action. Intelligence will inform the commander of threats that may be present in a particular country. The most direct and potentially lethal threat to US forces may come from elements other than the threat's military forces. Intelligence must also be aware of the condition of, or conditions leading to, a failed state.

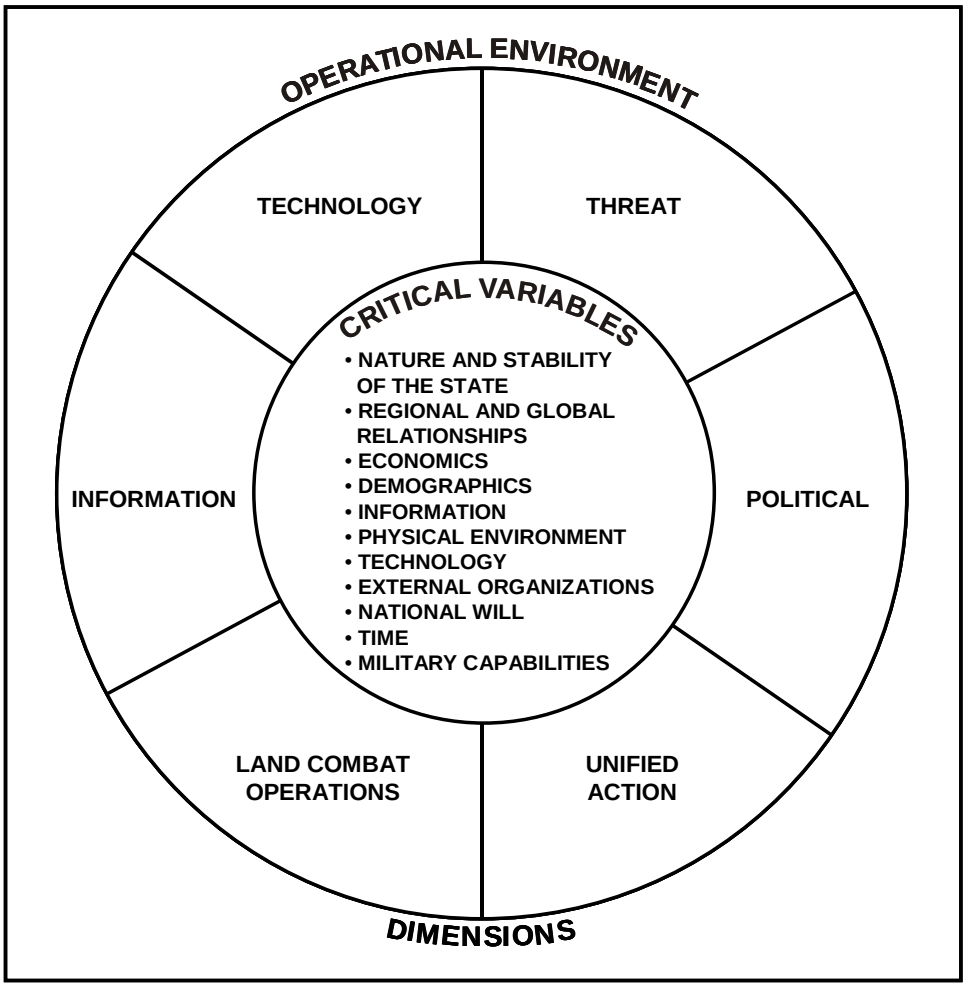

Figure 1-5. Critical Variables And Dimensions of the Operational Environment

REGIONAL AND GLOBAL RELATIONSHIPS

1-81. Nation-states and/or non-state actors often enter into relationships, which can be regional or global. These partnerships support common objectives, which can be political, economic, military, or cultural. When actors create regional or global alliances, it can add to their collective capability and broaden the scale of operations and actions. Intelligence will provide the commander with a visualization of all real and/or potential adversaries and the various aspects of their cooperation that could impact on the operation.

ECONOMICS

1-82. The economic variable consists of economic conditions in the region and economic ties between regional states and other world regions or other countries; the role that economic power plays in the operational environment; and the ability of the United States and its allies to apply economic power in the specific situation. A significant gap in the economic conditions among nation-states and other actors can be a source of conflict. Economic power

provides the enemy with increased flexibility and adaptability. It can provide an enemy with the ability to purchase modern technology that can be used to counter US operations and prolong operations. In some cases, economic superiority, rather than military superiority, may be the key to power or dominance within a region. The IPB process identifies those elements of economic power that may be a significant characteristic of the battlefield. However, the application of the economic instrument of national power lies primarily outside the military sphere.

DEMOGRAPHICS

1-83. The demographics variable includes the cultural, religious, and ethnic makeup of a given region, nation, or non-state actor; additionally, such factors as public health and other population trends must be considered. Intelligence and information enable the commander to understand the influences of the demographic features of his AO. An evaluation of the situation and possible threats with these factors in mind will provide the commander with knowledge concerning underlying demographics that could affect operations in the region. Additionally, intelligence can provide information on whether the population is sympathetic to the US or the enemy cause or is uncommitted in its views to either the US or the enemy.

INFORMATION

1-84. Broadcast media and other information means can make combat operations visible to a global audience. Various actors seek to use perceptions to control and manipulate how the public views events. The enemy will exploit US mistakes and failures, create disinformation based on falsehoods, and use propaganda to sway the local population to support their cause, to alienate world opinion, and to influence US public opinion. Media coverage can affect US political decisionmaking, internal opinion, or the sensitivities of multinational members. Intelligence can determine the enemy's ability to manage and manipulate information as well as assess the enemy's ability to access or disrupt US systems (for example, satellite communications [SATCOM] and imagery). Intelligence can also inform the commander on the enemy's communication infrastructure, to include its capabilities and vulnerabilities.

PHYSICAL ENVIRONMENT

1-85. The main elements of the physical environment are terrain and weather, including the medical threat. Intelligence often considers terrain and weather effects on not only the earth's surface but also subterranean, aerospace, and space. Potential enemies understand that less complex and open environments favor a US force. Therefore, the enemy may try to operate in urban environments, in complex terrain, and in weather conditions that may adversely affect US military operations and mitigate technological advantages. Intelligence provides a thorough analysis and evaluation of the effects of weather, prevalent diseases, and terrain on military operations. Analysis of the adversary provides information on his preferred tactics, weapons systems, and other capabilities and vulnerabilities.

TECHNOLOGY

1-86. Even adversaries lacking a research and development (R&D) capability can purchase sophisticated systems, or gain access to such systems, in the global marketplace. Commanders and staffs should prepare for adversaries who use technology in sophisticated ways. These ways may differ sharply from the ways that US forces use similar technologies. The technology that nations or non-state actors can bring to the OE includes what they can develop, as well as what they can acquire through purchase or capture. MI —

- Provides intelligence on the enemy's technological capabilities and vulnerabilities.
- Provides the commander with intelligence regarding the enemy's potential technological ability to achieve equality or even superiority against the US in selected areas.
- Indicates whether or not the enemy is employing dual-use technologies.

EXTERNAL ORGANIZATIONS

1-87. When the US Army conducts operations of any kind in a failed state or areas torn by conflict, it is likely to find non-governmental organizations (NGOs), international humanitarian organizations, multinational corporations, and other civilian organizations at work there. These organizations and/or their members can have both stated and hidden interests and objectives that can either assist or hinder US mission accomplishment. Defining the battlefield environment should provide the commander with information as to the impact civilians on the battlefield will have on mission accomplishment. Intelligence, in conjunction with other members of the commander's staff, can inform the commander on the number and types of humanitarian organizations and multinational corporations operating in the country or region and whether those organizations are supporting or hindering US mission accomplishment.

NATIONAL WILL

1-88. The willingness of the people to submit to enemy operations can be a significant characteristic of the battlefield. The intensity and durability of this support can influence the objectives of a conflict, its duration, the type and intensity of the enemy's operations in opposition to US operations, and the conditions for ending the conflict. Intelligence about the national will could affect the conduct of information operations.

TIME

1-89. Potential adversaries of the US generally view time as being to their advantage. An adversary may see prolonging combat operations for an extended period as a means of tying down US forces, increasing opportunities to inflict casualties on US forces, stirring public opinion in the area of responsibility (AOR) against the US presence and operations, and creating dissatisfaction in US public opinion. For example, an adversary can use the time required for US forces to deploy into an area to manipulate the nature of the conflict, attempting to control the tempo of operations by influencing early entry operations and prolonging operations with the desire to increase friendly casualties. Once US forces have deployed and begun operations in an

AOR, the adversary may adopt modes of operation that seek to avoid decisive conflict to inflict casualties on US forces and create more favorable conditions for future combat. Intelligence provides the commander with information on the enemy's ability to use the time factor to impact on the commander's mission.

MILITARY CAPABILITIES

1-90. Intelligence supports the commander's understanding of the adversary's military capabilities and ability to use conventional and unconventional tactics. The adversary will be flexible, thinking, adaptive, and capable of using a combination of conventional and unconventional warfare tactics. Modern technology will enhance his capabilities. Terrorism, suicide bombings, WMD, sabotage, information warfare, and assassinations are but a few of the tactics within the adversary's arsenal.

THE INTELLIGENCE PROCESS

1-91. Intelligence operations generally include the five functions that constitute the intelligence process: **plan, prepare, collect, process,** and **produce**. Additionally, there are three common tasks that occur across the five functions of the intelligence process: **analyze, disseminat*e,*** and **assess**. The three common tasks are discussed after the last function, produce. The intelligence process functions are not necessarily sequential; this is what differentiates the Army's intelligence process from the Joint intelligence cycle. The intelligence process provides a common model with which to guide one's thinking, discussing, planning, and assessing about the threat or AOI environment. The intelligence process generates information about the threat, the AOI, and the situation, which allows the commander and staff to develop a plan, seize and retain the initiative, build and maintain momentum, and exploit success.

PLAN

1-92. The plan step consists of the activities that identify pertinent IRs and develop the means for satisfying those requirements. The CCIRs (PIRs and FFIRs) drive the planning of the ISR effort. The intelligence officer supports the G3/S3 in arranging the ISR effort, based on staff planning, to achieve the desired collection effects. Planning activities include, but are not limited to—

- Conducting IPB.
- Managing requirements.
- Submitting RFIs and using intelligence reach to fill information gaps.
- Evaluating reported information.
- Establishing the intelligence communications and dissemination architecture.
- Developing, managing, and revising the intelligence synchronization plan and the ISR plan as mission requirements change.

PREPARE

1-93. The failure of MI units or personnel to accomplish their tasks or missions can often be attributed to their failure to prepare. The prepare step includes those staff and leader activities which take place upon receiving

the operation order (OPORD), operation plan (OPLAN), warning order (WARNO), or commander's intent in order to improve the unit's ability to execute tasks or missions.

1-94. The most habitual and egregious preparation failures committed by leaders (as evidenced by performance at the combat training centers) is not the conduct of specific tasks, but the failure to adequately coordinate for more generic combat requirements such as—

- Friendly forward unit liaison.
- Departing or reentering friendly lines or AOs.
- Fire support: enroute, at mission location, and return.
- Casualty evacuation procedures.
- Passwords (running, forward of friendly lines), recognition signals, call signs, and frequencies.
- Resupply.
- Movement through friendly AOs.

COLLECT

1-95. The collect step involves collecting and reporting information in response to ISR tasking. ISR assets collect information and data about threat forces, activities, facilities, and resources as well as information concerning the environmental and geographical characteristics of a particular battlespace. A successful ISR effort results in the timely collection and reporting of relevant and accurate information. This collected information forms the foundation of intelligence databases, intelligence production, and the G2's/S2's situational understanding. The requirements manager evaluates the reported information for its responsiveness to the CCIRs (PIRs and FFIRs).

PROCESS

1-96. Processing involves converting collected data and information into a form that is suitable for analyzing and producing intelligence. Examples of processing include developing film, enhancing imagery, translating a document from a foreign language, converting electronic data into a standardized report that can be analyzed by a system operator, and correlating information.

1-97. Processing data and information is performed unilaterally and cooperatively by both humans and automated systems.

PRODUCE

1-98. The produce step involves evaluating, analyzing, interpreting, synthesizing, and combining information and intelligence from single or multiple sources into intelligence or intelligence products in support of known or anticipated requirements. Production also involves combining new information and intelligence with existing intelligence in order to produce intelligence in a form that the commander and staff can apply to the MDMP and that supports and helps facilitate situational understanding. During the produce step, the intelligence staff manipulates information by—

- Analyzing the information to isolate significant elements.

- Evaluating the information to determine accuracy, timeliness, usability, completeness, precision, and reliability.
- Combining the information with other relevant information and previously developed intelligence.
- Applying the information to estimate possible outcomes.
- Presenting the information in a format that will be most useful to its eventual user.

1-99. The intelligence staff deals with numerous and varied production requirements based on PIRs and intelligence requirements; diverse missions, environments, and situations; and presentation requirements. Through analysis, collaboration, and intelligence reach, the G2/S2 and the staff use the collective intelligence production capability of higher, lateral, and subordinate echelons to meet the production requirements. Proficiency in these techniques and procedures facilitates the intelligence staff's ability to answer command and staff requirements regardless of the factors of METT-TC.

1-100. The three common tasks, discussed below, can occur throughout the intelligence process.

Analyze

1-101. The intelligence staff analyzes intelligence and information about the enemy's capabilities, friendly vulnerabilities, and the battlefield environment as well as issues and problems that arise within the intelligence process itself to determine their nature, origin, and interrelationships. This analysis enables commanders, staffs, and leaders to determine the appropriate action or reaction and to focus or redirect assets and resources to fill information gaps or alleviate pitfalls. It is also within the analyze function that intelligence analysts sort through large amounts of collected information and intelligence to obtain only that information which pertains to the CCIRs (PIRs and FFIRs), maintenance of the COP, and facilitates the commander's situational understanding.

Disseminate

1-102. Disseminating is communicating relevant information of any kind from one person or place to another in a usable form by any means to improve understanding or to initiate or govern action. Disseminating intelligence entails using information management techniques and procedures to deliver timely, relevant, accurate, predictive, and usable intelligence to the commander. Determining the product format and selecting the means to deliver it are key aspects of dissemination. Information presentation may be in a verbal, written, interactive, or graphic format. The type of information, the time allocated, and the individual preference of the commander all influence the information format.

Assess

1-103. Assessment plays an integral role in all aspects of the intelligence process. Assessing includes evaluating the effectiveness of intelligence in supporting the operation. Assessing the situation and available information begins upon receipt of the mission and continues throughout the intelligence

process. The continual assessment of intelligence operations and ISR efforts, available information and intelligence, and various aspects of the factors of METT-TC are critical to ensure—

- The G2/S2 answers all CCIRs (PIRs and FFIRs).
- The G2/S2 and G3/S3 redirect ISR assets to support changing requirements.
- Using information and intelligence properly.

INTELLIGENCE DISCIPLINES

1-104. Intelligence disciplines are categories of intelligence functions. The Army's intelligence disciplines are All-Source Intelligence, Human Intelligence (HUMINT), Imagery Intelligence (IMINT), Signals Intelligence (SIGINT), Measurement and Signatures Intelligence (MASINT), Technical Intelligence (TECHINT), and Counterintelligence (CI). Although JP 2-0 defines these intelligence disciplines, it also includes Open-Source Intelligence (OSINT) as a separate intelligence discipline. Because OSINT is more appropriately defined as a category of information, used singly or integrated into an all-source analytical approach, it is not defined in this manual as an intelligence discipline. For more information regarding the intelligence disciplines, see Part Three of this manual, as well as the respective manuals, which covers each individual intelligence discipline.

ALL-SOURCE INTELLIGENCE

1-105. All-source intelligence is defined as the intelligence products, organizations, and activities that incorporate all sources of information and intelligence, including open-source information, in the production of intelligence. All-source intelligence is a separate intelligence discipline, as well as the name of the task used to produce intelligence from multiple intelligence or information sources.

HUMAN INTELLIGENCE

1-106. HUMINT is the collection of foreign information—by a trained HUMINT Collector—from people and multimedia to identify elements, intentions, composition, strength, dispositions, tactics, equipment, personnel, and capabilities. It uses human sources as a tool, and a variety of collection methods, both passively and actively, to collect information.

IMAGERY INTELLIGENCE

1-107. IMINT is intelligence derived from the exploitation of imagery collected by visual photography, infrared, lasers, multi-spectral sensors, and radar. These sensors produce images of objects optically, electronically, or digitally on film, electronic display devices, or other media.

SIGNALS INTELLIGENCE

1-108. SIGINT is a category of intelligence comprising either individually or in combination all communications intelligence (COMINT), electronic intelligence (ELINT), and foreign instrumentation signals intelligence (FISINT), however transmitted. SIGINT is derived from communications, electronics, and foreign instrumentation signals.

MEASUREMENT AND SIGNATURES INTELLIGENCE

1-109. MASINT is technically derived intelligence that detects, locates, tracks, identifies, and/or describes the specific characteristics of fixed and dynamic target objects and sources. It also includes the additional advanced processing and exploitation of data derived from IMINT and SIGINT collection. MASINT collection systems include but are not limited to radar, spectroradiometric, electro-optical (E-O), acoustic, radio frequency (RF), nuclear detection, and seismic sensors, as well as techniques for gathering chemical, biological, radiological, and nuclear (CBRN), and other material samples.

TECHNICAL INTELLIGENCE

1-110. TECHINT is intelligence derived from the collection and analysis of threat and foreign military equipment and associated materiel for the purposes of preventing technological surprise, assessing foreign scientific and technical (S&T) capabilities, and developing countermeasures designed to neutralize an adversary's technological advantages.

COUNTERINTELLIGENCE

1-111. CI counters or neutralizes intelligence collection efforts through collection, counter-intelligence investigations, operations, analysis, and production, and functional and technical services. CI includes all actions taken to detect, identify, track, exploit, and neutralize the multidiscipline intelligence activities of friends, competitors, opponents, adversaries, and enemies; and is the key intelligence community contributor to protect US interests and equities. CI assists in identifying EEFI, identifying vulnerabilities to threat collection, and actions taken to counter collection and operations against US forces.

FORCE PROJECTION OPERATIONS

1-112. Force projection is the military component of power projection. It is a central element of the national military strategy. Army organizations and installations, linked with joint forces and industry, form a strategic platform to maintain, project, and sustain ARFOR, wherever they deploy. Force projection operations are inherently joint and require detailed planning and synchronization. Force projection encompasses a range of processes—mobilization, deployment, employment, sustainment, and redeployment—discussed below.

1-113. The Army must change its mindset from depending on an "intelligence buildup" to performing intelligence readiness on a daily basis in order to meet the requirements for strategic responsiveness. MI personnel, even in garrison at the lowest tactical echelons, must use their analytic and other systems and prepare for possible operations on a daily basis.

1-114. Built on a foundation of intelligence readiness, the Intelligence BOS provides the commander with the intelligence he needs to plan, prepare, and execute force projection operations. Successful intelligence during force projection operations relies on continuous collection and intelligence production before and during the operation. In a force projection operation,

higher echelons will provide intelligence to lower echelons until the tactical ground force completes entry and secures the lodgment area. The joint force J2 must exercise judgment when providing information to subordinate G2s/S2s so not to overwhelm them. Figure 1-6 is an example of force projection intelligence.

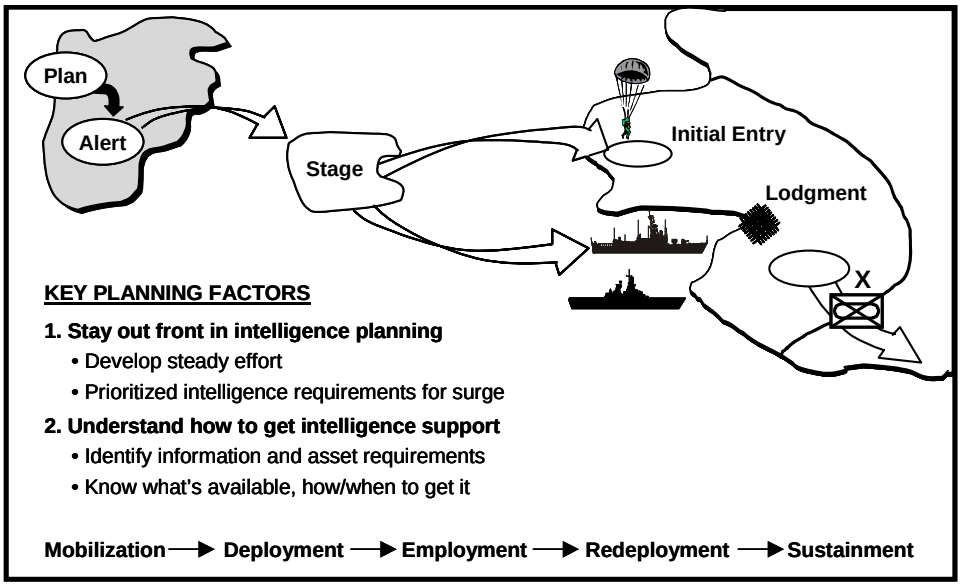

Figure 1-6. Force Projection Intelligence.

1-115. The G2/S2 must anticipate, identify, consider, and evaluate all threats to the entire unit throughout force projection operations. This is critical during the deployment and entry operations stages of force projection. During these stages, the unit is particularly vulnerable to enemy actions because of its limited combat power and knowledge of the AO. Intelligence personnel must, therefore, emphasize the delivery of combat information and intelligence products that indicate changes to the threat or battlespace developed during predeployment IPB.

1-116. The G2/S2 should—

- Review available databases on assigned contingency AOIs, conduct IPB on these AOIs, and develop appropriate IPB products.
- Comply with higher headquarters standing operating procedures (SOPs) and manuals for specific intelligence operations guidance.
- Coordinate for and rehearse electronic message transfers (for example, Internet Protocol addresses, routing indicators) using the same communications protocols with theater, higher headquarters, subordinate, and lateral units that the unit would use when deployed.
- Plan, train, and practice surging intelligence functions on likely or developing contingency crises.
- Prepare and practice coordination from predeployment through redeployment with other elements and organizations (for example, HUMINT, IMINT, SIGINT, MASINT, IO, staff weather officer [SWO],

civil affairs [CA], psychological operations [PSYOP], and special operations forces [SOF] units, to include databases and connectivity).

- Include the following as a part of daily (sustainment) operations:
  - RC and other augmentation.
  - A linguist plan with proficiency requirements. (Alert linguists through early entry phases of deployment.)
  - Training (individual and collective).
- Establish formal or informal intelligence links, relationships, and networks to meet developing contingencies.
- Forward all RFIs to higher headquarters in accordance with SOPs.
- Establish statements of intelligence interests (SIIs), other production, and I&W requirements.

1-117. To draw intelligence from higher echelons and focus intelligence downward, based on the commander's needs, the G2/S2 must—

- Understand the J2's multiple echelon and broadcast dissemination capability to ensure near-real time (NRT) reporting to all deployed, in transit, or preparing to deploy forces.
- Maintain or build intelligence databases on the environment and threats for each probable contingency.
- State and record the CCIR (as a minimum, list the PIRs and ISR tasks or requests).

1-118. Until the unit's collection assets become operational in the AO, the G2/S2 will depend upon intelligence from the ARFOR or JTF to answer the unit's intelligence needs. The following paragraphs describe the intelligence and ISR considerations during force projection.

MOBILIZATION

1-119. Mobilization is the process by which the armed forces or part of them are brought to a state of readiness for war or other national emergency. It assembles and organizes resources to support national objectives. Mobilization includes activating all or part of the RC, and assembling and organizing personnel, supplies, and materiel. A unit may be brought to a state of readiness for a specific mission or other national emergency. This process, called mobilization, is where specific AC or RC units, capabilities, and personnel are identified and integrated into the unit. During mobilization, the G2/S2 must—

- Monitor intelligence reporting on threat activity and I&W data.
- Manage IRs and RFIs from their unit and subordinate units to include updating ISR planning.
- Establish habitual training relationships with their AC and RC augmentation units and personnel as well as higher echelon intelligence organizations as identified in the existing OPLAN. Support the RC units and augmentation personnel by preparing and conducting intelligence training and threat update briefings and by disseminating intelligence.
- Identify ISR force requirements for the different types of operations and contingency plans (CONPLANs).

- Identify individual military, civilian, and contractor augmentation requirements for intelligence operations. The Army, and the Intelligence BOS in particular, cannot perform its missions without the support of its Department of the Army Civilians (DACs) and contractors. The force increasingly relies on the experience, expertise, and performance of non-uniformed personnel and has fully integrated these non-uniformed personnel into the warfighting team.

1-120. During mobilization the G2/S2, in conjunction with the rest of the staff, must ensure the adequacy of training and equipping of AC and RC MI organizations and individual augmentees to conduct intelligence operations.

1-121. The G2/S2 supports peacetime contingency planning with IPB products and databases on likely contingency areas. The G2/S2 establishes an intelligence synchronization plan that will activate upon alert notification. For smooth transition from predeployment to entry, the G2/S2 must coordinate intelligence synchronization and communications plans before the crisis occurs. The intelligence synchronization plan identifies the intelligence requirements supporting those plans, to include—

- ISR assets providing support throughout the AOI.
- Command and support relationships of ISR assets at each echelon.
- Report and request procedures not covered in unit SOPs.
- Sequence of deployment of ISR personnel and equipment. Early deployment of key ISR personnel and equipment is essential for force protection and combat readiness. Composition of initial and follow-on deploying assets is influenced by the factors of METT-TC, availability of communications, and availability of lift.
- Communications architecture supporting both intelligence staffs and ISR assets.
- Friendly vulnerabilities to hostile intelligence threats and plans for conducting FP measures. The staff must begin this type of planning as early as possible to ensure adequate support to FP of deploying and initial entry forces.
- Monitor time-phased force and deployment data (TPFDD) and recommend changes in priority of movement, unit, or capability to enable ISR operations.

1-122. The G2/S2 must continually monitor and update the OPLANs to reflect the evolving situation, especially during crisis situations. National intelligence activities monitor regional threats throughout the world and can answer some intelligence requirements supporting the development of OPLANs.

1-123. Upon alert notification, the G2/S2 updates estimates, databases, IPB products, and other intelligence products needed to support command decisions on force composition, deployment priorities and sequence, and the AOI. Units reassess their collection requirements immediately after alert notification. The G2/S2 begins verifying planning assumptions within the OPLANs. CI and ISR personnel provide FP support and antiterrorism measures.

1-124. Throughout mobilization, unit intelligence activities will provide the deploying forces with the most recent intelligence on the AO. The intelligence staff will also update databases and situation graphics. The G2/S2 must—

- Fully understand the unit, ARFOR, and joint force intelligence organizations.
- Revise intelligence and intelligence-related communications architecture and delete or integrate any new systems and software with the current architecture.
- Support 24-hour operations and provide continuous intelligence.
- Plan all required intelligence reach procedures.
- Determine transportation availability for deployment and availability when deployed.
- Determine all sustainability requirements.
- Determine intelligence release requirements and restrictions; releasability to multinational and HN sources.
- Review status of forces agreements (SOFAs), rules of engagement (ROE), international laws, and other agreements, emphasizing the effect that they have on intelligence collection operations. (Coordinate with the staff judge advocate [SJA] on these issues.)
- Ensure ISR force deployment priorities are reflected in the TPFDD to support ISR operations based upon the factors of METT-TC.
- Ensure intelligence links provide the early entry commander vital access to multi-source army and joint intelligence collection assets, processing systems, and databases.
- Review the supporting unit commanders' specified tasks, implied tasks, task organization, scheme of support, and coordination requirements with forward maneuver units. Address issues or shortfalls and direct or coordinate changes.
- Establish access to national HUMINT, IMINT, SIGINT, MASINT, and CI databases, as well as automated links to joint service, multinational, and HN sources.

DEPLOYMENT

1-125. Deployment is the movement of forces and materiel from their point of origin to the AO. This process has four supporting components: predeployment activities, fort to port, port to port, and port to destination; these components are known collectively as reception, staging, onward movement, and integration (RSO&I) activities. Success in force projection operations hinges on timely deployment. The size and composition of forces requiring lift are based on the factors of METT-TC, availability of prepositioned assets, the capabilities of HN support, and the forward presence of US forces. Force or tactical tailoring is the process used to determine the correct mix and sequence of deploying units.

1-126. During deployment, intelligence organizations at home station or in the rear area take advantage of modern SATCOM, broadcast technology, and automated data processing (ADP) systems to provide graphic and textual intelligence updates to the forces enroute. Enroute updates help eliminate

information voids and, if appropriate, allow the commander to adjust the plan prior to arrival in theater in response to changes in the OE or enemy actions.

1-127. Intelligence units extend established networks to connect intelligence staffs and collection assets at various stages of the deployment flow. Where necessary, units establish new communications paths to meet unique demands of the mission. The theater and corps analysis and control elements (ACEs) play a critical role in making communications paths, networks, and intelligence databases available to deploying forces.

1-128. Space-based systems are key to supporting intelligence during the deployment and the subsequent stages of force projection operations by—

- Monitoring terrestrial AOIs through ISR assets to help reveal enemy location and disposition, attempting to identify the enemy's intent.
- Providing communications links between forces enroute and in the continental United States (CONUS).
- Permitting MI collection assets to accurately determine their position through the Global Positioning System (GPS).
- Providing timely and accurate data on meteorological, oceanographic, and space environmental factors that might affect operations.
- Providing warning of theater ballistic missile launches.
- Providing timely and accurate weather information to all commanders through the Integrated Meteorological System (IMETS).

1-129. Situation development dominates intelligence operations activities during initial entry operations. The G2/S2 attempts to identify all threats to arriving forces and assists the commander in developing FP measures. During entry operations, echelons above corps (EAC) organizations provide intelligence. This support includes providing access to departmental and joint intelligence and deploying scalable EAC intelligence assets. The entire effort focuses downwardly to provide tailored support to deploying and deployed echelons in response to their CCIRs (PIRs and FFIR).

1-130. Collection and processing capabilities are enhanced, as collection assets build up in the deployment area, with emphasis on the build-up of the in-theater capability required to conduct sustained ISR operations. As the build-up continues, the G2/S2 strives to reduce total dependence on extended split-based intelligence from outside the AO. As assigned collection assets arrive into the theater, the G2/S2 begins to rely on them for tactical intelligence although higher organizations remain a source of intelligence.

1-131. As the ARFOR enter the theater of operations, the joint force J2 implements and, where necessary, modifies the theater intelligence architecture. Deploying intelligence assets establishes liaison with staffs and units already present in the AO. Liaison personnel and basic communications should be in place prior to the scheduled arrival of parent commands. ISR units establish intelligence communications networks.

1-132. CONUS and other relatively secure intelligence bases outside the AO continue to support deployed units. Systems capable of rapid receipt and processing of intelligence from national systems and high capacity, long-haul communications systems are critical to the success of split-based support of a

force projection operation. These systems provide a continuous flow of intelligence to satisfy many operational needs.

1-133. The G2/S2, in coordination with the G3/S3, participates in planning to create conditions for decisive operations. The G2/S2 also adjusts collection activities as combat strength builds. During entry operations the G2/S2—

- Monitors FP indicators.
- Monitors the ISR capability required to conduct sustained intelligence operations.
- Monitors intelligence reporting on threat activity and I&W data.
- Develops measurable criteria to evaluate the results of the intelligence synchronization plan.
- Assesses—
  - Push versus pull requirements of intelligence reach.
  - Effectiveness of the intelligence communications architecture.
  - Reporting procedures and timelines.
  - Intelligence to OPLANs and OPORDs, branches, and sequels (to include planning follow-on forces).

EMPLOYMENT

1-134. Employment is the conduct of operations to support a JFC commander. Employment encompasses an array of operations, including but not limited to—

- Entry operations (opposed or unopposed).
- Shaping operations (lethal and non-lethal).
- Decisive operations (combat or support).
- Postconflict operations (prepare for follow-on missions or redeployment).

Entry Operations

1-135. Enemies often possess the motives and means to interrupt the deployment flow of ARFOR. Threats to deploying forces may include advanced conventional weaponry (air defense, mines, etc.) and WMD. Sea and air ports of debarkation (PODs) should be regarded as enemy HPTs because they are the entry points for forces and equipment. PODs are vulnerable because they are fixed targets with significant machinery and equipment that is vulnerable to attack; in addition to military forces and materiel, HN support personnel, contractors, and civilians may all be working there. An enemy attack, or even the threat of an enemy attack, on a POD can have a major impact on force projection momentum. Commanders at all levels require predictive intelligence so that they may focus attention on security actions that reduce vulnerabilities. To avoid, neutralize, or counter threats to entry operations, the commanders rely on the ability of the G2/S2 to support future operations by accurately identifying enemy reactions to US actions, anticipating their response to our counteractions and predicting additional ECOAs.

1-136. Predictive intelligence also supports the decisions the commander and staff must make about the size, composition, structure, and deployment

sequence of the force in order to create the conditions for success. Commanders rely on predictive intelligence to identify potential friendly decisions before the actual event. While thorough planning develops friendly COAs to meet possible situations, the nature of an operation can change significantly before execution. The G2/S2 must provide timely, accurate, and predictive intelligence to ensure the commander can retain the initiative to implement his plan or his decisions before he loses the opportunity to do so.

Shaping Operations

1-137. Shaping operations create and preserve conditions for the success of the decisive operation. Shaping operations include lethal and non-lethal activities conducted throughout the AO. They support the decisive operation by affecting enemy capabilities and forces, or by influencing enemy decisions. G2/S2 intelligence analysis and ISR activities support the development and execution of shaping operations by identifying threat centers of gravity and decisive points on the battlefield. The G2/S2 also ensures the intelligence process focuses on the CCIRs (PIRs and FFIRs). It is critical that the G2/S2 provide timely, accurate, and predictive intelligence to the commander so that he may execute shaping operations. Predictive intelligence should provide sufficient time for the commander to understand how the enemy will react to US COAs so that appropriate shaping operations can be implemented.

Decisive Operations

1-138. Decisive operations are those that directly accomplish the task assigned by the higher headquarters. Decisive operations conclusively determine the outcome of major operations, battles, and engagements. Continuously synchronized ISR activities, coupled with predictive intelligence results and products during all stages of force projection, combine to ensure the commander is prepared to employ the right forces with the right support to conduct decisive operations at the most appropriate place and time. In addition to coordinating with the G3/S3 to synchronize all ISR activities, the G2/S2 must answer the CCIRs (PIRs and FFIRs) and provide continuous assessments of the enemy's current situation and predict the enemy's subsequent COA, branches, and/or sequels.

Postconflict Operations

1-139. Upon cessation of hostilities or truce, deployed forces enter a new stage of force projection operations. Postconflict operations focus on restoring order, reestablishing HN infrastructure, preparing for redeployment of forces, and planning residual presence of US forces. While postconflict operations strive to transition from conflict to peace, there remains a possibility of resurgent hostilities by individuals and forces. The ISR effort, particularly predictive intelligence analysis, remains just as critical in postconflict operations as in the other employment operations. ISR operations support the postconflict emphasis on restoration operations exemplified by commanders redirecting their CCIRs (PIRs and FFIRs) and IRs to support units conducting these missions. These operations might include—

- Engineer units conducting mine clearing or infrastructure reconstruction operations.

- Medical and logistics units providing humanitarian relief.
- MP units providing law and order assistance.
- CA units reestablishing local control and preparing for the orderly transition of local governments and to support civil-military operations (CMO).

SUSTAINMENT

1-140. Sustainment involves providing and maintaining levels of personnel and materiel required to sustain the operation throughout its duration. It is essential to generating combat power. CSS may be split-based between locations within and outside CONUS. These operations include ensuring units have the MI assets required to accomplish the mission, such as personnel (including linguists), communications systems, ISR systems, and appropriate maintenance support.

REDEPLOYMENT

1-141. Redeployment is the process by which units and materiel reposture themselves in the same theater; transfer forces and materiel to support another JFC's operational requirements; or return personnel and materiel to the home or demobilization station upon completion of the mission. Redeployment operations encompass four phases:

- Recovery, reconstitution, and pre-deployment activities.
- Movement to and activities at the port of embarkation (POE).
- Movement to the POD.
- Movement to homestation.

1-142. As combat power and resources decrease in the AO, FP and I&W become the focus of the commander's intelligence requirements. This in turn drives the selection of those assets that must remain deployed until the end of the operation and those that may redeploy earlier. The S2—

- Monitors intelligence reporting on threat activity and I&W data.
- Continues to conduct intelligence to FP.
- Requests ISR support (theater and national systems) and intelligence in support of redeployment.

1-143. After redeployment, MI personnel and units recover and return to predeployment activities. ISR units resume contingency-oriented peacetime intelligence operations. RC ISR units demobilize and return to peacetime activities. G2/S2s must—

- Monitor intelligence reporting on threat activity and I&W data.
- Update or consolidate databases.
- Maintain intelligence readiness.
- Provide their input into the Force Design Update (FDU) process to refine modified table of organizations and equipment (MTOE) and evaluate the need for Individual Mobilization Augmentee (IMA) personnel.

Chapter 2

Intelligence and Unified Action

UNIFIED ACTION

2-1. As discussed in JP 1-02 and Chapter 1, unified action describes the wide scope of actions (including the synchronization of activities with governmental and NGO agencies) taking place within unified commands, subordinate unified commands, or JTFs under the overall direction of the commanders of those commands. Under unified action, commanders integrate joint, single-service, special, and supporting intelligence operations with interagency, nongovernmental, and multinational operations. The ARFOR often brings unique ISR capabilities to unified action operations.

2-2. In a unified action, the intelligence staff takes on additional responsibilities, relationships, and infrastructure to execute multi-service and multinational intelligence operations. This chapter discusses the synchronization of Army intelligence efforts with joint and other national and international partners to achieve unity of effort and to accomplish the commander's intent.

THE LEVELS OF WAR

2-3. The levels of war are doctrinal perspectives that clarify the links between strategic objectives and tactical actions. Although there are no finite limits or boundaries between them, the three levels of war are strategic, operational, and tactical (see Figure 2-1).

- The strategic level is that level at which a nation, often as one of a group of nations, determines national and multinational security objectives and guidance and develops and uses national resources to accomplish them.
- The operational level is the level at which campaigns and major operations are conducted and sustained to accomplish strategic objectives within theaters or AOs. It links the tactical employment of forces to strategic objectives.
- The tactical level is the employment of units in combat. It includes the ordered arrangement and maneuver of units in relation to each other, the terrain, and the enemy to translate potential combat power into victorious battles and engagements.

2-4. Understanding the interdependent relationship of all three levels of war helps commanders visualize a logical flow of operations, allocate resources, and assign tasks. Actions within the three levels are not associated with a particular command level, unit size, equipment type, or force or component type. The concept of strategic, operational, and tactical intelligence operations aids JFCs and their J2s in visualizing the flow of intelligence from one level to the next. The concept facilitates allocating required collection, analysis, production, and dissemination resources; and facilitates the

assignment of appropriate intelligence tasks to national, theater, component, and supporting intelligence elements.

STRATEGIC

2-5. The President and the Secretary of Defense use strategic intelligence to develop national strategy and policy, monitor the international situation, prepare military plans, determine major weapon systems and force structure requirements, and conduct strategic operations.

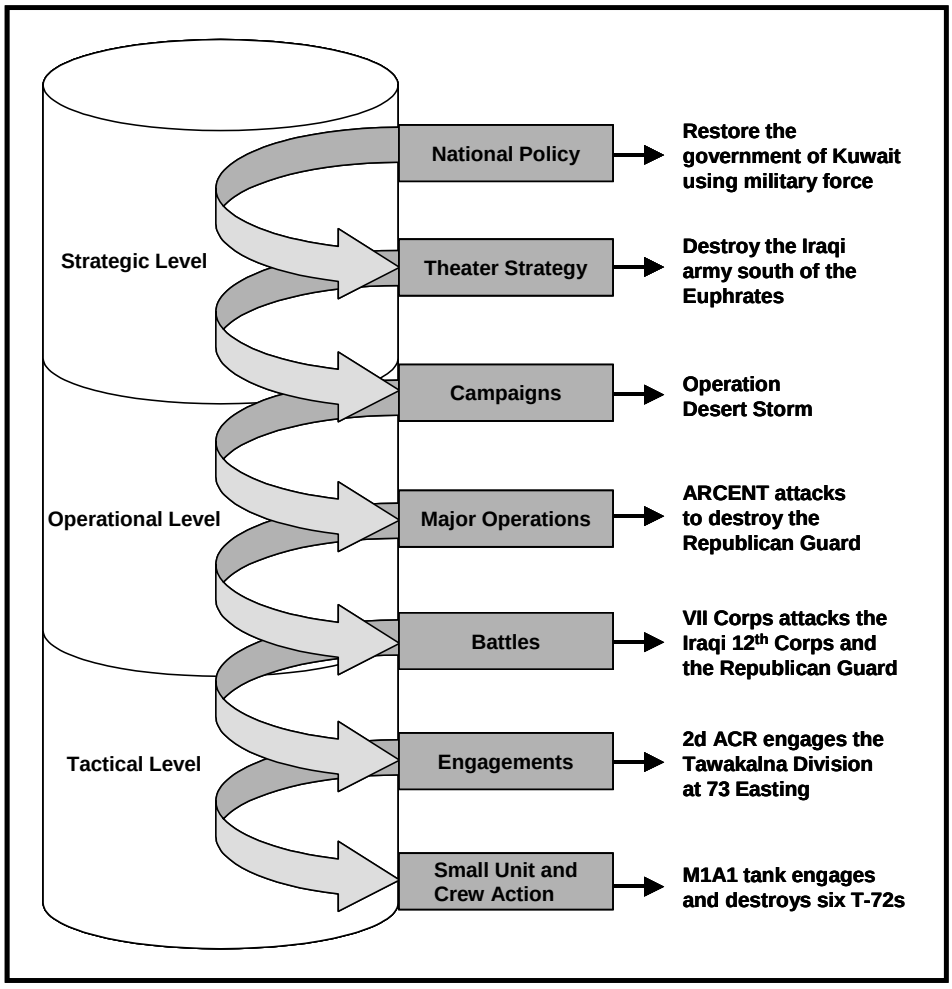

Figure 2-1. The Levels of War.

2-6. Intelligence supports joint operations across the full spectrum of military operations. It determines the current capabilities, and forecasts future developments, of adversaries or potential adversaries that could affect the national security and interests. A strategic operation also produces the intelligence required by combatant commanders to prepare strategic estimates, strategies, and plans to accomplish missions assigned by higher authorities. Theater intelligence includes determining when, where, and in what strength the adversary will stage and conduct theater level campaigns

and strategic unified operations. The intelligence staff should also focus predictive analysis efforts on identifying strategic threat events and how these events will impact US actions at the strategic, operational, and tactical levels. Intelligence operations support IO as well. Intelligence operations support strategic planning by—

- Developing strategic intelligence policy.
- Preparing the strategic collection plan.
- Allocating national intelligence resources.

2-7. Intelligence requirements are those requirements generated from the staff's IRs regarding the enemy and environment that are not a part of the CCIRs (PIRs and FFIRs). Intelligence requirements require collection and can provide answers in order to identify indicators of enemy actions or intent, which reduce the uncertainties associated with an operation. Significant changes (that is, branches and sequels) with an operation usually lead to changes in intelligence requirements. Of particular importance is information relating to enemy or threat strategic vulnerabilities, strategic forces, strategic centers of gravity, and any capabilities relating to the development and employment of CBRNE.

2-8. Global and regional issues and threats are identified and reported to the President and the Secretary of Defense, as well as to the senior military leadership and the combatant commanders. Intelligence requirements include any foreign developments that could threaten the US, its citizens abroad, or multinational military, political, or economic interests. Intelligence also includes identifying hostile reactions to US reconnaissance activities and indications of impending terrorist attacks (I&W). For a complete listing of strategic tasks, refer to CJCSM 3500.04C.

OPERATIONAL

2-9. Combatant commanders and subordinate JFCs and their component commanders are the primary users of intelligence. At the operational echelons, intelligence—

- Focuses on the military capabilities and intentions of enemies and threats.
- Provides analysis of events within the AOI and helps commanders determine when, where, and in what strength the adversary might stage and conduct campaigns and major operations.
- Supports all phases of military operations, from mobilization all the way through redeployment of US forces, and continues during sustainment.
- Supports all aspects of the joint campaign.
- Identifies adversary centers of gravity and HVTs.
- Provides critical support to friendly IO.

2-10. The JFC and staff allocate intelligence resources and request support from national agencies, other theaters, and multinational partners. During stability operations and support operations, operational intelligence includes training and assisting multinational partners in conducting intelligence operations.

2-11. Combatant commanders use intelligence concerning the nature and characteristics of the battlespace to determine the type and scale of operations. Intelligence also aids in determining the impact of significant regional features and hazards on the conduct of both friendly and adversary operations. Significant regional factors include the natural environment, political, informational, economic, industrial, infrastructure, geographic, demographic, topographic, hydrographic, climatic, populace, cultural, medical, lingual, historical, and psychological aspects of the AOI. Intelligence analysis also assists in determining the ROE and other restrictions which will affect operations in the JFC's AO.

2-12. Intelligence relating to the adversary's military and nonmilitary capabilities assists in determining the adversary's ability to conduct military operations. Factors that operational intelligence addresses include mobilization potential, force structure (including alliance forces), force dispositions, equipment, military doctrine, C2 structure, and their MDMP. Intelligence includes the continuous refinement of the OBs for the entire array of the enemy's forces in the AOI. For a complete listing of operational tasks, refer to CJCSM 3500.04C.

US Army Intelligence and Security Command (INSCOM)

2-13. The U.S. Army has vested its intelligence at the operational level with INSCOM, the major Army command (MACOM) responsible for the Army's intelligence forces above Corps. INSCOM's mission is to conduct and support dominant intelligence, security, and information operations for military commanders and national decisionmakers. The INSCOM strategy is to provide superior information and information capabilities to Army commanders, while denying the same to adversaries. Headquarters (HQ), INSCOM, in coordination with its major subordinate commands (MSCs), provides a myriad of general intelligence support operations. INSCOM is providing a globally focused, rapidly deployable, knowledge based, adaptively force packaged capability, supporting commanders and leaders with actionable intelligence at the point of decision. INSCOM serves as the national to tactical Intelligence bridge.

Army Space Program Office (ASPO)

2-14. ASPO executes the Army's Tactical Exploitation of National Capabilities Program (TENCAP). The program focuses on exploiting current and future tactical potential of national systems and integrating the capabilities into the Army's tactical decisionmaking process. Army TENCAP systems enable the tactical commander maximum flexibility to satisfy intelligence needs under a wide range of operational scenarios. ASPO is the point of contact (POC) for all tactical activities between MACOMs or users and the National Reconnaissance Office (NRO).

TACTICAL

2-15. Tactical commanders use intelligence for planning and conducting battles and engagements. Relevant, accurate, predictive, and timely intelligence allows tactical units to achieve an advantage over their adversaries. Precise and predictive intelligence, on the threat and targets, is

essential for mission success. Predictive intelligence also enables the staff to better identify or develop ECOAs. Tactical intelligence—

- Identifies and assesses the enemy's capabilities, COAs, and vulnerabilities, as well as describes the battlespace.
- Seeks to identify when, where, and in what strength the enemy will conduct tactical level operations.
- Provides the commander with information on imminent threats to the force including those from terrorists, saboteurs, insurgents, and foreign intelligence collection.
- Provides critical support to friendly IO.
- Develops and disseminates targeting information and intelligence.

2-16. Intelligence provides the tactical commander with the information and intelligence he requires to successfully employ combat forces against enemy forces. Thus, intelligence tasks support the execution of battles and engagements. These intelligence tasks are different from those at other levels due to their ability to immediately influence the outcome of the tactical commander's mission. They include information gathered from tactical sources, such as combat information, interrogations, debriefings, and eliciting information from captured or misplaced personnel. For a complete listing of tactical tasks, refer to FM 7-15.

CATEGORIES OF INTELLIGENCE

2-17. Directly or indirectly, the unit receives intelligence from throughout the US intelligence community. The intelligence operations and products of national, joint, and service organizations that make up the intelligence community fall into one of six categories:

- I&W.
- Current intelligence.
- GMI.
- Target intelligence.
- S&T intelligence.
- CI.

2-18. The categories of intelligence are distinguishable from each other primarily by the purpose of the intelligence product. The categories can overlap and some of the same intelligence is useful in more than one category. Depending upon the echelon, intelligence organizations use specialized procedures to develop each category of intelligence. The following information describes each category.

INDICATIONS AND WARNINGS

2-19. Indications and warnings (I&W) are those intelligence activities intended to detect and report time-sensitive intelligence information on foreign developments that could involve a threat to the US or allied and/or coalition military, political, or economic interests or to US citizens abroad. I&W includes forewarning of enemy actions or intentions; the imminence of hostilities; insurgency; nuclear or non-nuclear attack on the US, its overseas

forces, or alliled and/or coalition nations; hostile reactions to US reconnaissance activities; terrorist attacks; and other similar events. (JP 3-13). I&W comes from time-sensitive information and analysis of developments that could involve a threat to the US and multinational military forces, US political or economic interests, or to US citizens. While the G2/S2 is primarily responsible for producing I&W intelligence, each element, such as the MPs conducting PIO, within every unit contributes to I&W through awareness of the CCIRs and reporting related information.

CURRENT INTELLIGENCE

2-20. Current intelligence involves the integration of time-sensitive, all-source intelligence and information into concise, accurate, and objective reporting on the battlespace and current enemy situation. One of the most important forms of current intelligence is the enemy situation portion of the COP. The G2/S2 is responsible for producing current intelligence for the unit. Current intelligence supports ongoing operations across full spectrum operations. In addition to the current situation, current intelligence should provide projections of the enemy's anticipated situations (estimates) and their implications on the friendly operation.

GENERAL MILITARY INTELLIGENCE

2-21. GMI is intelligence concerning military capabilities of foreign countries or organizations or topics affecting potential US or multinational military operations relating to armed forces capabilities, including OB, organization, training, tactics, doctrine, strategy, and other factors bearing on military strength and effectiveness and area and terrain intelligence. This broad category of intelligence is normally associated with long-term planning at the national level. However, GMI is also an essential tool for the intelligence staff and should be in place long before the start of preparations for a particular military operation. An up-to-date, comprehensive intelligence database is critical to the unit's ability to plan and prepare rapidly for the range of operations and global environments in which it may operate. GMI supports the requirement to quickly respond to differing crisis situations with corresponding intelligence spanning the globe. One of the many places to get information for GMI is the medical intelligence database. The G2/S2 planner develops his initial IPB from GMI products.

2-22. The G2/S2 develops and maintains the unit's GMI database on potential threat forces and environments based on the commander's guidance. As an essential component of intelligence readiness, this database supports the unit's planning, preparation, execution, and assessment of operations. The G2/S2 applies and updates the database as it executes its intelligence production tasks.

TARGET INTELLIGENCE

2-23. Target intelligence is the analysis of enemy units, dispositions, facilities, and systems to identify and nominate specific assets or vulnerabilities for attack, re-attack, or exploitation (for intelligence). It consists of two mutually supporting production tasks: target development and combat assessment.

- **Target development** is the systematic evaluation and analysis of target systems, system components, and component elements to determine HVTs for potential attack through maneuver, fires, or non-lethal means.
- Once attacked, **combat assessment** provides a timely and accurate estimate of the affects of the application of military force (lethal or non-lethal) an IO on targets and target systems based on predetermined objectives.

SCIENTIFIC AND TECHNICAL INTELLIGENCE

2-24. Scientific and technical intelligence (S&TI) is the product resulting from the collection, evaluation, analysis, and interpretation of foreign S&T information which covers foreign developments in basic and applied research and in applied engineering techniques and S&T characteristics, capabilities, and limitations of all foreign military systems, weapons, weapon systems, and materiel, the research and development (R&D) related thereto, and the production methods employed for their manufacture.

2-25. S&T intelligence concerns foreign developments in basic and applied sciences and technologies with warfare potential. It includes characteristics, capabilities, vulnerabilities, and limitations of all weapon systems, subsystems, and associated materiel, as well as related R&D. S&T intelligence also addresses overall weapon systems and equipment effectiveness. Specialized organizations—such as the Defense Intelligence Agency (DIA) Missile and Space Intelligence Center (MSIC), INSCOM, Air Missile Defense (AMD), Area Air and Missile Defense Command (AAMDC), and National Ground Intelligence Center (NGIC)—produce this category of intelligence. The G2/S2 establishes instructions within SOPs, orders, and plans for handling and evacuating captured enemy materiel (CEM) for S&T intelligence (S&TI) exploitation.

COUNTERINTELLIGENCE

2-26. As previously defined at the end of Chapter 1, CI attempts to identify and recommend countermeasures to the threat posed by foreign intelligence security services (FISS) and the ISR activities of non-state entities such as organized crime, terrorist groups, and drug traffickers. CI analysis incorporates information from all sources as well as the results of CI collection, investigations, and operations to analyze the multidiscipline threat posed by foreign intelligence services and activities.

INTELLIGENCE COMMUNITY

2-27. There are many organizations in the intelligence community that support military operations by providing specific intelligence products and services. The J2/G2/S2 and his staff must be familiar with these organizations and the methods of obtaining information from them as necessary. Figure 2-2 shows organizations that compose the intelligence community.

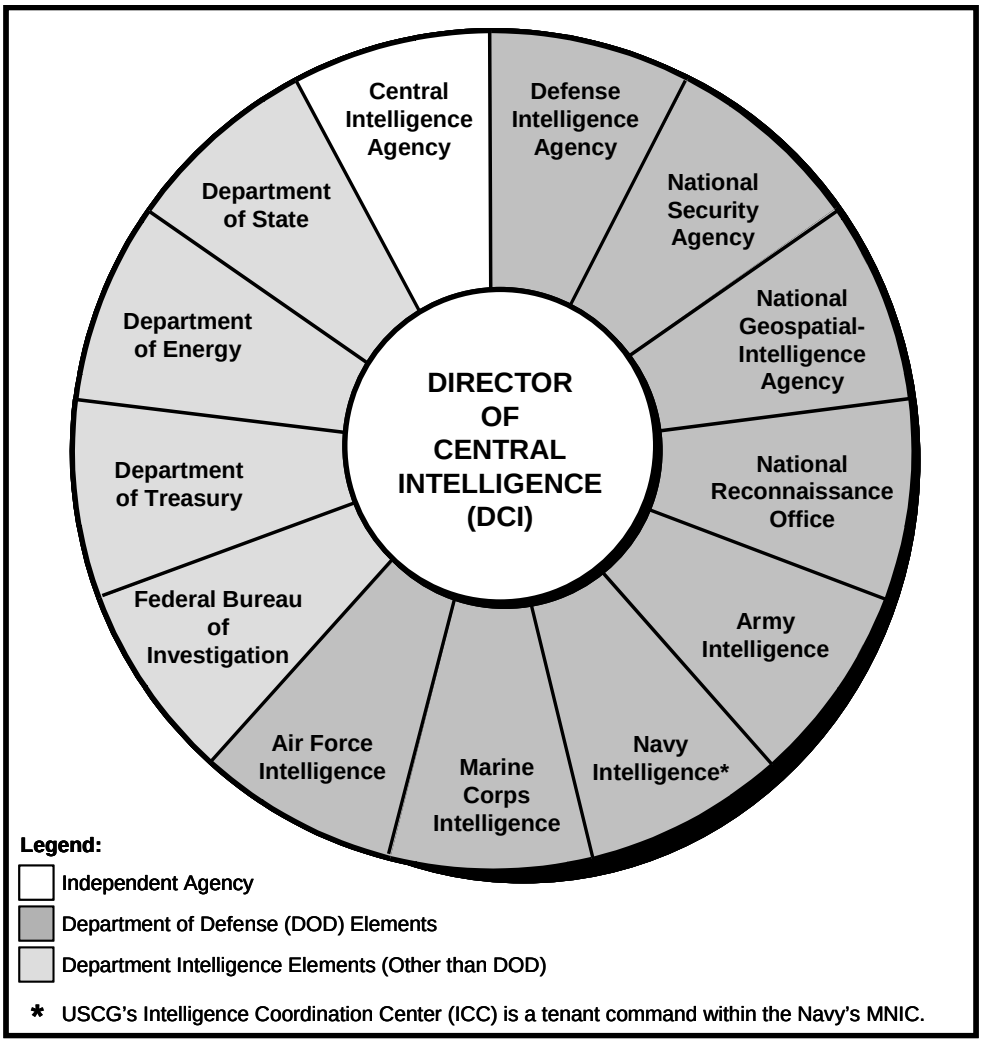

Figure 2-2. Intelligence Community Membership.

DOD AGENCIES

Defense Intelligence Agency (DIA)

2-28. DIA is a combat support agency and a major collector and producer in the defense intelligence community. The DIA supports the full spectrum of operations to include basic MI, counterterrorism, counterdrugs, medical intelligence, WMD and proliferation, United Nations (UN) peacekeeping and multinational support, missile and space intelligence, noncombatant evacuation operations (NEOs), targeting, combat assessment, and battle damage assessment (BDA).

National Security Agency (NSA)

2-29. NSA ensures cryptologic planning and support for joint operations. Working with the tactical cryptologic units of a command, the NSA provides SIGINT and information security (INFOSEC), encompassing communications security (COMSEC) and computer security, as well as telecommunications

support and operations security (OPSEC). The people and equipment providing SIGINT, INFOSEC, and OPSEC constitute the United States Cryptologic System (USCS). The NSA, through the USCS, fulfills cryptologic command and/or management, readiness, and operational responsibilities in support of military operations according to the Secretary of Defense tasking, priorities, and standards of timeliness.

National Geospatial-Intelligence Agency (NGA)

2-30. The NGA (formerly National Imagery and Mapping Agency [(NIMA)] mission is to provide timely, relevant, and accurate intelligence and geospatial information in support of national security objectives of the United States. The Director of NGA advises the Secretary of Defense, Director Central Intelligence (DCI), Chairman of the Joint Chiefs of Staff (JCS), and the combatant commanders on imagery, IMINT, and geospatial information. The Operations Directorate, Customer Support Office, is the focal point for interface with external customers, including the JCS, combatant commands, services, and national and defense agencies.

National Reconnaissance Office (NRO)

2-31. The NRO develops and operates unique and innovative space reconnaissance systems and conducts intelligence-related activities essential for US security. The role of the NRO is to enhance US government and military information superiority across full spectrum operations. NRO responsibilities include supporting I&W, monitoring arms control agreements, and performing crisis support to the planning and conduct of military operations. The NRO accomplishes its mission by building and operating IMINT and SIGINT reconnaissance satellites and associated communications systems

US Navy (USN)

2-32. Naval intelligence products and services support the operating naval forces, the Department of the Navy, and the maritime intelligence requirements of national level agencies. Naval intelligence operates the National Maritime Intelligence Center (NMIC). Naval intelligence responsibilities include maritime intelligence on global merchant affairs, counter-narcotics, fishing issues, ocean dumping of radioactive waste, technology transfer, counter-proliferation, cryptologic related functions, CI, I&W support, management of Coast Guard collection, and development of new weapons systems and countermeasures.

US Marine Corps (USMC)

2-33. USMC intelligence provides pre-deployment training and force contingency planning for requirements that are not satisfied by theater, other service, or national capabilities. The Marine Corps Intelligence Agency (MCIA) handles the integration, development, and application of GMI, technical information, all-source production, and open-source information.

US Air Force (USAF)

2-34. USAF ISR assets fill a variety of roles to meet US national security requirements. The USAF operates worldwide ground sites and an array of

airborne ISR platforms to meet national level intelligence requirements. To support day-to-day USAF operations and to meet specific USAF requirements, intelligence professionals at the wing and squadron levels use suites of interoperable analysis tools and dissemination systems to tailor information received from all levels and agencies in the intelligence community. USAF responsibilities include all-source information on aerospace systems and potential adversaries' capabilities and intentions, cryptologic operations, I&W, IO, and criminal investigative and CI services.

NON-DOD AGENCIES

2-35. Although the primary focus of non-DOD members of the intelligence community is strategic intelligence and support to the President and the Secretary of Defense, these agencies also produce intelligence and intelligence products that support operational and tactical ARFOR. This responsibility includes assessing potential issues and situations that could impact US national security interests and objectives. These agencies identify global and regional issues and threats. Some of the intelligence products and services these agencies provide are essential to accurate assessment of the threat and battlespace, particularly during stability operations and support operations.

Central Intelligence Agency (CIA)

2-36. The CIA's primary areas of expertise are in HUMINT collection, imagery, all-source analysis, and the production of political and economic intelligence. CIA and military personnel staff the CIA's Office of Military Affairs (OMA). As the CIA's single POC for military support, OMA negotiates, coordinates, manages, and monitors all aspects of agency support for military operations. This support is a continuous process, which the agency enhances or modifies to respond to a crisis or developing operation. Interaction between OMA and the DCI representatives to the Office of the Secretary of Defense (OSD), the Joint Staff, and the combatant commands facilitates providing national level intelligence in support of joint operations, contingency and operations planning, and exercises.

Department of State, Bureau of Intelligence and Research

2-37. The Bureau of Intelligence and Research coordinates programs for intelligence, analysis, and research; it produces intelligence studies and current intelligence analyses essential to foreign policy determination and execution. Its subordinate Bureau of International Narcotics Matters develops, coordinates, and implements international narcotics control assistance activities. It is the principal POC and provides policy advice on international narcotics control matters for the Office of Management and Budget (OMB), the NSC, and the White House Office of National Drug Control Policy (ONDCP). The Bureau also oversees and coordinates the international narcotics control policies, programs, and activities of US agencies.

Department of Energy, Office of Nonproliferation and National Security

2-38. The Department of Energy's Office of Nonproliferation and National Security assists in the development of the State Department's policy, plans,

and procedures relating to arms control, nonproliferation, export controls, and safeguard activities. Additionally, this office is responsible for—

- Managing the department's R&D program.
- Verifying and monitoring arms implementation and compliance activities.
- Providing threat assessments and support to headquarters and field offices.

Department of the Treasury

2-39. The US Treasury Department's intelligence-related missions include producing and disseminating foreign intelligence relating to US economic policy and participating with the Department of State in the overt collection of general foreign economic information.

Federal Bureau of Investigation (FBI)

2-40. The FBI is the principal investigative arm of the Department of Justice (DOJ) and has primary responsibility for CI and counterterrorism operations conducted in the US. CI operations contemplated by any other organizations in the US must be coordinated with the FBI. Any overseas CI operation conducted by the FBI must be coordinated with the CIA.

Department of Homeland Security

2-41. The mission of the Department of Homeland Security is to develop and coordinate the implementation of a comprehensive national strategy to secure the US from terrorist threats or attacks. The organizational construct of homeland security mission is a framework of prepare, deter, preempt, defend, and respond. Component agencies will analyze threats and intelligence, guard our borders and airports, protect our critical infrastructure, and coordinate the response of our nation for future emergencies. The component agencies of the department include—

- US Coast Guard (USCG).
- US Customs Service.
- US Border Patrol.
- Federal Emergency Management Agency (FEMA).
- Immigration and Naturalization Service (INS).
- Transportation Security Administration.
- Federal Protective Service.
- Office of Domestic Preparedness.

United States Coast Guard (USCG)

2-42. The USCG, subordinate to the Department of Homeland Security, has unique missions and responsibilities as both an armed force and a law enforcement agency (LEA), which makes it a significant player in several national security issues. The USCG intelligence program supports counter-drug operations, mass seaborne migration operations, alien migration interdiction operations, living marine resource enforcement, maritime intercept operations, port status and/or safety, counterterrorism, coastal and

harbor defense operations, and marine safety and/or environmental protection.

Other Agencies

2-43. There are a number of US Government agencies and organizations, not members of the intelligence community, that are responsible for collecting and maintaining information and statistics related to foreign governments and international affairs. Organizations such as the Library of Congress, the Departments of Agriculture and Commerce, the National Technical Information Center, US Information Agency, US Information Service, and the US Patent Office are potential sources of specialized information on political, economic, and military-related topics. The intelligence community may draw on these organizations to support and enhance research and analysis and to provide relevant information and intelligence for planners and decisionmakers. Many other US Government agencies may become directly involved in supporting DOD especially during stability operations and support operations. (See JP 2-02 for a description of agency support to joint operations and intelligence.) These organizations include—

- Department of Transportation.
- Disaster Assistance Response Team within the Office of Foreign Disaster.
- US Agency for International Development.
- NGA.

UNIFIED ACTION INTELLIGENCE OPERATIONS

2-44. In unified action, ARFOR synchronize their actions with those of other participants to achieve unity of effort and to accomplish the combatant commander's objectives. Unified action links subordinates to the combatant commander under combatant command (command authority) (COCOM). Multinational, interagency, and nonmilitary forces work with the combatant commander through cooperation and coordination. Combatant commanders form theater strategies and campaigns, organize joint forces, designate operational areas, and provide strategic guidance and operational focus to subordinates. The aim is to achieve unity of effort among many diverse agencies in a complex environment. Subordinate JFCs synchronize joint operations in time and space, direct the action of foreign military forces (multinational operations), and coordinate with governmental and NGOs (interagency coordination) to achieve the same goal.

2-45. The J2 staff provides intelligence promptly, in an appropriate form, and by any suitable means to those who need it. Intelligence personnel ensure that the consumers understand the intelligence and assist them as they apply the intelligence to their operations.

2-46. Dissemination requires establishing appropriate communications systems and procedures. The J2 and other intelligence personnel must fully participate in all operation planning and execution, and develop close working relationships with the JFC and other staff elements.

2-47. The commander and staff assess intelligence operations to determine their effectiveness and to make any necessary improvements. The intelligence process functions presented in Chapter 4 provide the criteria for evaluating intelligence operations.

JOINT INTELLIGENCE OPERATIONS

2-48. The JTF commanders and his intelligence staff must—

- Understand the intelligence requirements of superior, subordinate, and component commands.
- Identify organic intelligence capabilities and shortfalls.
- Access theater and national systems to ensure appropriate intelligence and CI products are available to the JTF.

2-49. The JTF's intelligence effort focuses on integrating multi-source information and multi-echelon intelligence into all-source intelligence products that provide clear, relevant, and timely knowledge of the enemy and battlespace. These products must be in formats that are readily understood and directly usable by the recipient in a timely manner. They must neither overload the user nor the communications architecture.

2-50. The J2 is the JTF commander's focal point for intelligence. The J2 directly supports the JFC's responsibilities for determining objectives, directing operations, and evaluating the effects of those operations. The J2 supports the execution of the plan with the intelligence needed to sustain the operation, attain joint force objectives, provide support to subordinate commands, and continually support FP efforts. The J2 analyzes the potential threat situation and provides assessments to support friendly opportunities. The J2 then supports the execution of the plan with the operational intelligence needed to sustain the operations, attain joint force objectives, and support FP. To maintain the initiative, the JFC will seek to get inside the adversary's decisionmaking cycle; that is, the JFC will seek to develop procedures and an organization in order to receive new and accurate intelligence and respond to the new situation faster than the adversary. The J2 must help in identifying the adversary's decisionmaking cycle and identifying vulnerabilities that may be exploited. The J2 also—

- Ensures the provision of the required ISR support to the JTF and its subordinate functional and service components.
- Assists the JTF commander in defining intelligence responsibilities and PIRs.
- Actively participates in joint staff planning and in planning, preparing, executing, and assessing ISR efforts. This includes leading the JTF's joint collection board and providing representation at the joint targeting board.

2-51. Figure 2-3 shows a typical JTF J2 organization. The overall organization of the JTF and operations will dictate actual composition of the J2. At a minimum, a core element of analytical, ISR management, and administrative capabilities is required.

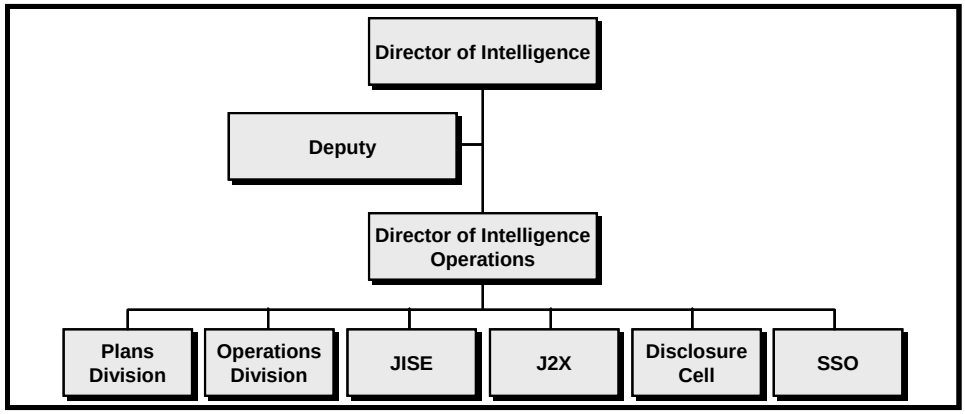

Figure 2-3. Typical Joint Task Force J2 Organization.

Considerations In Joint Intelligence Operations

2-52. The Army, Air Force, Navy, Marine Corps, and SOF must provide globally responsive assets to support the combatant commanders' theater strategies and the national security strategy. The capabilities of the other armed forces complement those of ARFOR. During joint operations, they provide support consistent with JFC-directed missions. When conducting joint intelligence operations, there are a number of unique problems that can arise due to the complexity of integrating the efforts of the different services and commands. Elements affecting joint intelligence operations among the different services include the following:

- Intelligence liaison is critical to the success of intelligence operations and requires early establishment, particularly between units that have not routinely trained together and possess differing capabilities. As a minimum, organizations exchange liaison teams with the higher echelon organization. Additional liaison may be necessary to facilitate joint force collection, production, or dissemination requirements. Liaison teams—
  - Support planning and C2 of intelligence operations.
  - Ensure timely two-way flow of intelligence between commands.
  - Manage intelligence and resource requirements of the subordinate command.
  - Advise the commander on service ISR capabilities, limitations, and employment.
- Commanders and staffs use IPB to understand the battlespace and develop or refine plans and orders. IPB products exchanged between echelons ensure a common picture of the battlespace and estimate of the situation.
- Communications considerations for joint operations include—
  - Planning for intelligence communications transition to facilitate execution of branches or sequels to the plan or to accommodate shifting of the main effort from one force to another.

  - Identifying the initial communications architecture to include establishing procedures and protocols for information exchanges (databases, text, imagery, voice, and video).
  - Balancing the availability of service-unique intelligence systems between echelons or services. This may require each service providing additional resources. The senior commander is responsible for allocating resources.
  - Disseminating intelligence between commands and services. Additional communications equipment, intelligence terminals, and personnel may be required to balance capabilities between services.
- Identifying the databases each service possesses or has access to; determining which databases will support the operation and, if necessary, merge them into a single database; and ensure access by the entire force.
- Providing a focal point for subordinate command access to national or joint intelligence is essential. The senior commander will request and allocate resources required to support this access.

2-53. The JFC's intelligence requirements, concept of operation, and intent drive the ISR effort. The different organizations and services participating in joint intelligence operations must continuously share information, intelligence, and products to satisfy requirements. See FM 2-01 for details on intelligence requirements and RM. Activities required to facilitate an effective joint collection effort include—

- Coordinating intelligence and ISR operations to optimize capabilities of collection assets and reduce duplication of effort.
- Integrating supporting national and theater intelligence collection assets into the intelligence synchronization plan.
- Establishing procedures for tracking and handing off HPTs between services and echelons.
- Establishing procedures for cueing Army and other service collection assets.
- Coordinating airspace for ISR assets.
- Maximizing available linguist capabilities. Shortages of military linguists trained in target languages may require cross-leveling Army and other service linguists.

2-54. Reporting and intelligence production considerations in joint operations include—

- Establishing production criteria and thresholds that produce timely and relevant intelligence keyed to the commander's intelligence and targeting requirements. The ISM, attack guidance matrix (AGM), and HPT list are examples of tools used to support joint intelligence and targeting efforts. The sharing of these products to all echelons and services is crucial.
- Establishing common methodology and criteria for producing the BDA and supporting the combat assessment function.
- Establishing set standards for the number and frequency of periodic reports such as intelligence summaries (INTSUMs).

Joint Intelligence Architecture

2-55. In addition to the J2 staffs at every joint level of command, the key organizations in the joint intelligence architecture are the National Military Joint Intelligence Center (NMJIC) (see Figure 2-4), the Joint Intelligence Centers (JICs) or Joint Analysis Centers (JACs) of the unified commands, and, when formed, the JTF's joint intelligence support element (JISE). Working together, these organizations play the primary role in managing and controlling joint intelligence operations. The formal relationships which link these organizations facilitate information management and optimize complementary intelligence functions by echelon without obstructing the timely flow of intelligence up, down, or laterally.

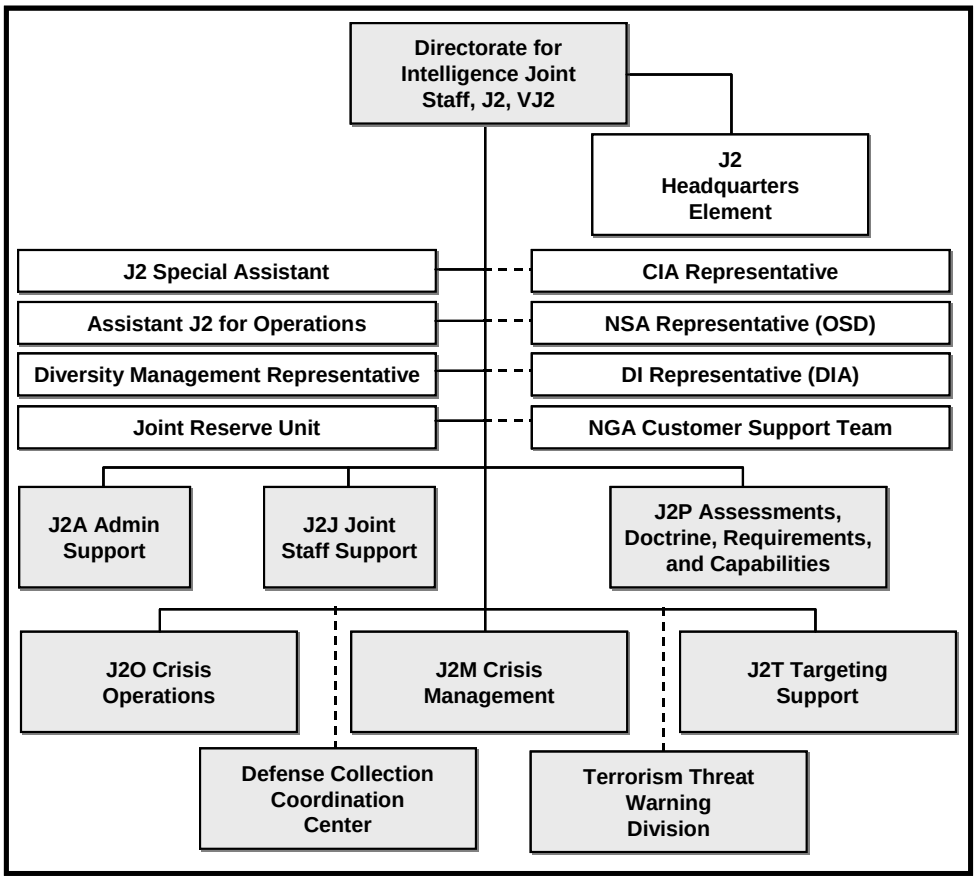

Figure 2-4. National Military Joint Intelligence Center.

2-56. The NMJIC is the focal point for intelligence activities in support of joint operations. The NMJIC is the CJCS J2 intelligence watch within the National Military Command Center (NMCC) in the Pentagon. When the assigned or attached assets cannot satisfy the combatant commander and the JTF commander's crisis-related and time-sensitive intelligence requirements, the NMJIC, as part of the J2's staff, sends tasks to appropriate agencies to fill the requirements. During crises, the NMJIC expands as necessary to establish a working group, intelligence task force, or an expanded intelligence task force. The NMJIC participates in targeting by developing national level

target lists. When requested, the NMJIC supports the theater in performing BDA. Besides supporting the combatant commands and JTFs, the NMJIC supports any multinational partners and prescribed international organizations.

2-57. The JIC is organized in accordance with the combatant commander's prerogatives, but normally performs the general functions described in JP 2-0 and specific unified command intelligence TTP. The JIC is responsible for providing intelligence to JTF and its subordinates during military operations. If the JIC cannot meet the combatant commander's requirements, the JIC forwards requests to the NMJIC or to subordinate command levels through established channels, using standard command procedures. In some cases, the JIC may also ensure timely support by approving a direct communication path, in advance, between requesters such as the JTF JISE and outside producers. In this case, the parties must inform the JIC of all requests as they occur. This method is most appropriate when the parties require products and services, which the JIC does not routinely produce.

2-58. At the discretion of the JTF commander, the J2 can establish a JISE during the crisis or preparation stage for operations to augment the J2 staff. The JISE is a tailored subset of the JIC or the intelligence organization of the service component designated as the JTF headquarters.

2-59. Under the direction of the J2, the JISE normally manages the intelligence collection, production, and dissemination for the JTF. The JISE provides intelligence to JTF operational forces and performs common intelligence functions. By design, the JISE is scaleable and can expand to meet the needs of the JTF and the operating environment. It is composed of analytical experts, analysis teams, and ISR managers that provide services and products, which the JTF, JTF staff, and subordinate components require. These experts, mentioned above, focus on solving the operational intelligence problems of concern to the JTF commander. The JISE's capability to perform all-source analysis and ISR synchronization is key to producing operational intelligence that is timely, relevant, and complete. Figure 2-5 illustrates the features of a typical JISE.

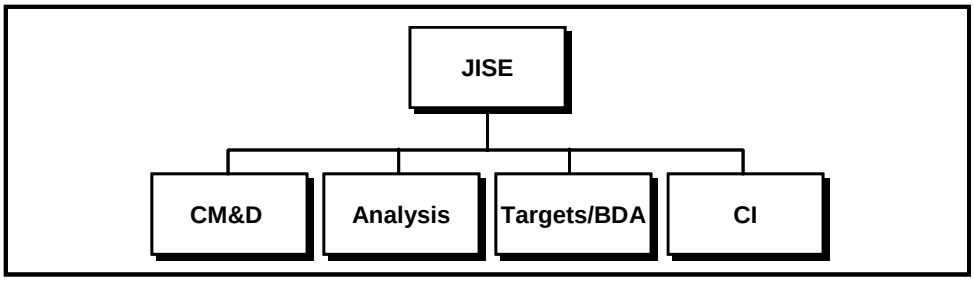

Figure 2-5. Typical Joint Intelligence Support Element.

Joint Task Force Intelligence Organizations

2-60. In addition to the JISE, the JTF commander and J2 may require other supporting JICs or teams based on projected operations. The JTF commander may make a request to the NMJIC for specific national intelligence agency capabilities. The NMJIC evaluates and coordinates the JTF commander's requirements with the J3, J5, and national intelligence agencies and tailors

the composition of the deployment packages to meet those needs. The deployment packages, such as the National Intelligence Support Team (NIST), provide access to the entire range of capabilities resident in the national intelligence agencies and can focus those capabilities on the JTF commander's intelligence requirements. The J2X manages and coordinates the HUMINT and CI activities of national, theater, and service components operating within the JTF's JOA. The Joint Captured Materiel Exploitation Center (JCMEC) assists in management of recovery, exploitation, and disposal of captured enemy equipment (CEE). The JTF commander's requirements dictate the composition and tailoring of such deployment packages.

Augmentation Considerations

2-61. Depending on the scale of the operations, the intelligence organizations described above and those of the JTF's subordinate command may require personnel augmentation. Optimum use of available intelligence assets is essential to ensure quality support in meeting the JTF commander's requirements.

2-62. The demand for additional intelligence increases significantly during crisis and wartime operations. As the need arises for more intelligence personnel, the intelligence presence also increases at all command levels. Locating additional intelligence personnel and knowing how to integrate those personnel into the operation is vital. The JTF J2 should identify intelligence personnel augmentation requirements in accordance with the Chairman, Joint Chiefs of Staff (CJCS) Instruction 1301.01. The combatant commander's joint table of mobilization and distribution (JTMD) also contains the standing augmentation requirements. The JTMD should reflect the need for either IMA or Individual Ready Reserve (IRR) personnel. The combatant commander and the JTF refine personnel requirements and initiate requests when they anticipate or start an operation.

2-63. A consideration for the JTF when requesting support or augmentation is that these national level teams and individual augmentees are not totally self-contained elements; rather they require logistic, information, and other support from the supported command. Each deployment is unique based on mission, duration, team composition, and capabilities required. A full NIST, for example, requires a private, access-controlled area within a sensitive compartmented information facility (SCIF) work environment and dedicated secure communications.

2-64. For more information on intelligence operations as they apply to other armed services, see the individual service intelligence doctrine. See also JP 2-0 series, JP 3-0, JP 3-55, and JP 5-0 for more details on joint intelligence operations and considerations.

Multinational Intelligence

2-65. Multinational intelligence operations take place within the structure of an alliance or coalition. Some multinational military organizations, such as the North Atlantic Treaty Organization (NATO) and the UN Command in the Republic of Korea (ROK), are highly structured and enduring. Others, such as the coalition formed during the Gulf War, are less formal and temporary.

2-66. In multinational operations, the multinational force commander (MNFC) exercises command authority over a military force composed of elements from two or more nations. Therefore, in most multinational operations, the JTF must share intelligence, as necessary, for mission accomplishment with foreign military forces and coordinate exchange of intelligence with those forces.

2-67. In some circumstances, the JTF may need to seek authority to go outside the usual political-military channels to provide information to NGOs. The JTF must tailor intelligence policy and dissemination criteria to each multinational operation.

INTELLIGENCE REACH

2-68. Military forces use intelligence reach to rapidly access information, receive support, and conduct collaboration and information sharing with other units and organizations unconstrained by geographic proximity, echelon, or command.

2-69. Intelligence reach supports minimizing the deployed footprint of ISR assets. By providing enhanced information and tailored intelligence products, intelligence reach can greatly enhance the intelligence capabilities of the unit and play a significant role in improving the commander's ability to make decisions on the battlefield. It allows the commander to harness national, joint, foreign, and other military organization resources. Table 2-1 shows examples of partners and sources for intelligence reach.

2-70. Detailed planning and training are critical to the success of intelligence reach operations. The following are steps that the staff can take to ensure optimal use, operability, and effectiveness of intelligence reach:

- Establish data exchange methods and procedures.
- Establish electronic message transfer procedures.
- Establish homepages for identified forces.
- Establish POCs for I&W centers, production centers, Theater JICs, DIA, INSCOM, and their major subordinate commands such as NGIC and the theater intelligence brigades and groups.
- Ensure the intelligence staff has the necessary personnel, training, automated systems, bandwidth, and resources to conduct intelligence reach.
- Determine IRs through staff planning. Develop production requirements for identified intelligence gaps.
- Order geospatial products for the projected joint AOI.
- Establish and maintain a comprehensive directory of intelligence reach resources before deployment and throughout operations. The value of intelligence reach will greatly increase as the staff develops and maintains ready access to rich information resources. These resources are numerous and may include, for example, Army, Joint, DOD, non-DOD, national, commercial, foreign, and university research programs. Know what types of information the resources can provide. Continuously expand the resource directory through identification of new resources.

- Use intelligence reach first to fill intelligence gaps and requirements and answer RFIs. This technique can preclude unnecessary tasking or risk to limited ISR assets.
- Maintain continuous situational understanding and anticipate intelligence requirements. Use intelligence reach to fulfill these requirements and provide the results to the commander and staff for planning and decisionmaking.
- Exchange intelligence reach strategies with other units.
- Present the information retrieved through intelligence reach in a usable form. Share the information derived from intelligence reach with subordinate, lateral, and higher echelons. Ensure follow-on forces have all information as well.

INTELLIGENCE REACH COMPONENTS

2-71. Intelligence reach requires the G2/S2 to develop a strategy on how best to support the unit's mission with intelligence reach capabilities. There are six basic components of the strategy:

- Push
- Database Access.
- Pull.
- Broadcast Services.
- Collaborative Tools.
- Requirements Management.

Push

2-72. Push occurs when the producers of intelligence or information are knowledgeable of the customer's requirements and are able to send the desired intelligence to the customer without further requests. Push is accomplished through the most appropriate or efficient dissemination means. Unless coordinated as an acceptable dissemination method, push is not accomplished solely by posting intelligence products on a web page. The entity that posts the document must ensure the intended recipient is aware of the product's location or has received the product.

2-73. Push begins with the statement of intelligence interest (SII). The SII establishes the unit's intelligence and IRs. The SII is prepared by intelligence staff organizations to register their interest in receiving recurring hardcopy and softcopy reports, studies, and publications covering a wide variety of intelligence subjects. The J2/G2/S2 works with the Department of the Army Production and Dissemination Management (DAPDM) to establish a profile for information transfer. Intelligence reports or information meeting the unit's requirements are then automatically sent directly to the unit's classified or unclassified networks or communication systems.

2-74. Organizations that push information and data down to subordinate units must be careful of the amount, detail, and focus of the information they are sending. Too much information will overwhelm the subordinate unit. Crucial information may be lost in the midst of an overabundant flow of information, much of which is of little use. Intelligence reach often runs more efficiently if the user pulls the information or at least focuses the intelligence producers to send the appropriate information with the correct level of detail at the appropriate time.

Database Access

2-75. Access to local, theater, DOD, non-DOD, and commercial databases allows analysts to leverage stored knowledge on topics ranging from basic demographics to OB information. A validated DIA Customer Number (acquired by the J2/G2/S2) in combination with Secret Internet Protocol Network (SIPRNET) and Joint Worldwide Intelligence Communications System (JWICS) connectivity establishes access to most of the databases online. The challenge for an analyst is to gain an understanding of the structure, contents, strengths, and weaknesses of the database regardless of database type. Additionally, the procedures are often difficult for extracting portions or downloading and transferring the database to unit level automated information systems.

2-76. Each intelligence discipline has unique databases established and maintained by a variety of agencies. Database access is accomplished through unit or agency homepages via SIPRNET (Intelink-S) and JWICS (Intelink). The DAPDM office, upon approving the unit's SII, validates the requirement for access to the majority of these databases. Units coordinate with the DA dissemination and program manager (DPM) and/or the agency for access to those databases requiring passwords and permissions beyond normal Intelink-S and Intelink access.

Pull

2-77. Pull occurs when the requestor is familiar enough with existing databases and products to be able to anticipate the location of the desired information. Knowledge of both the types and locations of intelligence databases can greatly increase the efficiency of the Intelligence BOS by saving time and effort on the part of analysts at every echelon.

2-78. The G2/S2 must also ensure that intelligence reach capability extends to multinational forces, augmentees, and other services or organizations working as part of the JTF. The G2/S2 must forward relevant intelligence to units which do not possess the necessary automation to conduct intelligence reach.

Broadcast Services

2-79. Broadcast services are an integrated, interactive dissemination system, focusing on tactical user's IRs using joint message formats. The theater broadcast's data prioritization and processing occur through information management. Selected tactical, theater, DOD, and national collectors broadcast their messages using prescribed message formats. The analyst decides which types of messages are required. Broadcast service data is responsive to the operational commander's information needs and allows tactical users to construct successively detailed pictures of the battlespace.

2-80. Tactical users require intelligence and information to be available at the lowest classification level possible (for example, collateral SECRET) and releasable, as necessary, to multinational partners. Broadcast service information management will adhere to national policy as it relates to the provision of data to NATO or multinational partners.

Collaborative Tools

2-81. Collaboration is the sharing of knowledge, expertise, and information, normally online, and may take numerous forms. Collaborative tools are computer-based tools (groupware) that help individuals work together and share information. They allow for virtual online meetings and data sharing. As an example of the use of collaborative tools, the President or the Secretary of Defense and DOD during a crisis situation will establish a number of crisis action teams (CATs) or joint interagency working groups (JIAWGs). These groups or teams are formed to address specified subjects or topics in support of the warfighter or decisionmaker. The groups will focus on the crisis and normally publish their products on a homepage. Analysts with online access can participate in a number of ways. This includes passively accessing the homepages to study the products, sending queries to the identified POCs, or by having their organization join the CAT or JIAWG. Table 2-2 shows some examples of collaborative tools.

Requirements Management

2-82. The RM system provides a mechanism for submitting RFIs, tasking, and managing ISR assets. Analysts who are trained and familiar with the RM process and the various tasking procedures can leverage its systems for refined information. Each intelligence discipline has established procedures

for requesting specific information. It is therefore advantageous to have someone familiar with each discipline's procedures to participate in synchronizing the ISR effort. For example, an analyst receives a HUMINT-based intelligence information report, which provides information on an event or subject. If he requires more refined data or clarification, he should submit a time-sensitive requirement or a source-directed requirement. This creates a two-way communication from the field to the collectors without creating additional standing requirements. The more familiar the analyst is with the RM process, the better he can leverage it.

2-83. The intelligence reach component of RM includes the ability of an intelligence officer at any level to request information, which is beyond what is available at his location. The normal procedure for obtaining intelligence or information not obtainable through the use of available ISR assets is to submit an RFI to the next higher echelon. Users enter RFIs into the RM system. See ST 2-33.5 for more information on intelligence reach operations and FM 2-01 for more information on RM.

Table 2-2. Examples of Collaborative Tools.

Tool	Description
Chat (Audio and Text)	Used to conduct conversations online.
Whiteboard	Permits real-time display of drawings, pictures, or documents for group discussion and comment. Participants can annotate in real time as well.
Bulletin Board	Used to post notices and facilitate discussions on any topic.
Video	Used at a desktop computer or a video teleconferencing (VTC) center to allow the person or group to see with whom they are communicating.
Discussion Groups (Newsgroups)	Topics are posted to a website for discussion and comment where participants can follow a line of discussion on a topic.
File-Sharing Tools	Virtual file cabinets allow information to be stored on web servers, and are available to anyone having access to the site and electronic permission to use the files.
Presentation Tools	Used in a virtual auditorium to allow lectures and briefings to be given to an audience.
Application Sharing	An entire team can use an application running on one computer to revise documents.
Text Tools	Allows live text input and editing by group members. Once complete, the text document can be copied into word processing software.
E-mail	Electronic mail.
Persistent Capability	The ability to preserve files, briefings, or other team or project material for future reference. Properly organized, it becomes an information management device and is invaluable to a long-term effort.
Instant Messaging	This allows real-time exchange of notes and messages.

PART TWO

Intelligence in Full Spectrum Operations

Part Two provides a primer of what and who constitutes both MI and the Intelligence BOS and the process that these entities use in order to provide warfighters and decisionmakers with the intelligence they require in order to accomplish their respective missions.

Chapter 3 discusses the role of MI and the Intelligence BOS within full spectrum operations. It provides an overview of intelligence readiness, particularly the intelligence requirements associated with force projection. The concept of MI asset technical control is discussed as a complement to, not a replacement of, the Army's command and support relationships.

Chapter 4 presents the Intelligence Process—the Intelligence BOS methodology that accomplishes the primary focus of intelligence in full spectrum operations, which provides the warfighter with effective intelligence.

Chapter 3

Fundamentals in Full Spectrum Operations

FULL SPECTRUM OPERATIONS

3-1. Army commanders at all echelons may combine different types of operations simultaneously and sequentially to accomplish missions. Full spectrum operations include offensive, defensive, stability, and support operations. Missions in any environment require ARFOR that are prepared to conduct any combination of these operations:

- **Offensive operations** aim to destroy or defeat an enemy. Their purpose is to impose US will on the enemy and achieve decisive victory.
- **Defensive operations** defeat an enemy attack, buy time, economize forces, or develop conditions favorable for offensive operations. Defensive operations alone normally cannot achieve a decision. Their purpose is to create conditions for a counteroffensive that allow ARFOR to regain the initiative.
- **Stability operations** promote and protect US national interests by influencing the threat, political, and information dimensions of the OE through a combination of peacetime developmental, cooperative activities, and coercive actions in response to crises. Regional security is supported by a balanced approach that enhances regional stability

and economic prosperity simultaneously. ARFOR presence promotes a stable environment.

- **Support operations** employ ARFOR to assist civil authorities, foreign or domestic, as they prepare for or respond to crises and relieve suffering. Domestically, ARFOR respond only when the President or Secretary of Defense direct. ARFOR operate under the lead federal agency and comply with provisions of US law, to include the Posse Comitatus and Stafford Acts. (See FM 3-0.)

3-2. Intelligence supports the commander across full spectrum operations. It helps the commander decide when and where to concentrate sufficient combat power to overwhelm the enemy. ISR is essential for the commander to preclude surprise from the enemy, maintain the initiative on the battlefield, and win battles. Commanders at all levels synchronize intelligence with the other BOSs to maximize their ability to see and strike the enemy simultaneously throughout the AO.

3-3. Every soldier in the command is responsible for detecting and reporting enemy activities, dispositions, and capabilities. This task is critical because the environment we operate in is characterized by violence, uncertainty, complexity, and asymmetric methods by the threat. The increased situational awareness that soldiers develop through personal contact and observation is a critical element of that unit's ability to more fully understand the OE. However, soldiers collect information, they are not intelligence collectors. While medical personnel cannot be assigned ISR tasks due to their Geneva Convention category status, medical personnel who gain information through casual observation of activities in plain view while discharging their humanitarian duties will report the information to their supporting intelligence element.

OFFENSIVE OPERATIONS

3-4. Offensive operations at all levels require effective intelligence to help the commander avoid the enemy's main strength and to deceive and surprise the enemy. During offensive operations, intelligence must provide the commander with the composition, disposition, limitations, employment characteristics, and anticipated enemy actions in a timely enough manner for the commander to significantly affect the enemy commander's decision cycle. It ensures commanders have the intelligence they need to conduct offensive operations with minimum risk of surprise.

DEFENSIVE OPERATIONS

3-5. The immediate purpose of defensive operations is to defeat an enemy attack. Commanders defend to buy time, hold key terrain, hold the enemy in one place while attacking in another, or destroy enemy combat power while reinforcing friendly forces. Intelligence should determine the enemy's strength, COAs, and location of enemy follow-on forces. The defending commander can then decide where to arrange his forces in an economy-of-force role to defend and shape the battlefield. Intelligence support affords him the time necessary to commit the striking force precisely.

3-6. Intelligence in area defensive operations identifies, locates, and tracks the enemy's main attack and provides the commander time to allocate

sufficient combat power to strengthen the defense at the point of the enemy's main effort. Intelligence should also identify where and when the commander can most decisively counterattack the enemy's main effort or exploit enemy vulnerabilities.

3-7. Although the battlefield is normally organized as decisive, shaping, and sustaining operations, commanders conducting defensive operations may delineate intelligence in battlefield organizational terms of deep area, close area, and rear area.

STABILITY OPERATIONS

3-8. The environment is often much more complex during stability operations and as a result intelligence is often more complex. In fact, intelligence is even more important a factor (or operational multiplier) during stability operations. As a result, the commander must be even more involved in and knowledgeable of ISR (to include ISR operations the commander controls and other higher level ISR operations that may be occurring within his AO) during stability operations. For example, the commanders must understand the complex details of HUMINT and special access program (SAP) operations.

3-9. The commander requires the appropriate intelligence and IPB products in order to determine how best to influence the threat, political and information dimensions of the operational environment, and enhance regional stability. The identification and analysis of characteristics of the terrain and weather, politics, infrastructure, health status, civilian press, attitudes, and culture of the local populace and all possible threats are important in conducting stability operations. A lack of knowledge concerning local politics, customs, and culture could lead to US actions which attack inappropriate targets or which may offend or cause mistrust among the local population.

SUPPORT OPERATIONS

3-10. Support operations are usually nonlinear and noncontiguous. Commanders designate the decisive, shaping, and sustaining operations necessary for mission success. However, determining the intelligence requirements that drive the ISR effort intending to identify any potential threat's centers of gravity and decisive points may require a more complex and unorthodox thought process than that used in offensive and defensive operations. The G2/S2 may have to define the enemy differently. In support operations, the adversary is often the effects of disease, hunger, or disaster on a civilian population. US forces conducting support operations must also fully understand the organization and identity of key figures or groups within the region where they are operating, as these figures may influence greatly the actions of the population—both civilian and military.

ELEMENTS OF COMBAT POWER

3-11. Combat power is the ability to fight. It is the total means of destructive or disruptive force, or both, that a military unit or formation can apply against the adversary at a given time. Commanders combine the elements of

combat power to meet constantly changing requirements and defeat an enemy. The elements of combat power are—

- **Manuever** is the employment of forces, through movement combined with fire or fire potential, to achieve a position of advantage with respect to the enemy to accomplish the mission. Maneuver is the means by which commanders concentrate combat power to achieve surprise, shock, momentum, and dominance.
- **Firepower** provides the destructive force essential to overcoming the enemy's ability and will to fight. Firepower magnifies the effects of maneuver by destroying enemy forces and restricting his ability to counter friendly actions; maneuver creates the conditions for the effective use of firepower.
- **Leadership** is the most dynamic element of combat power. Confident, audacious, and competent leadership focuses on the other elements of combat power and serves as the catalyst that creates conditions for success. Leadership provides purpose, direction, and motivation in all operations.
- **Protection** is the preservation of fighting potential of a force so the commander can apply maximum force at the decisive time and place. Protection is neither timidity nor risk avoidance.
- **Information** enhances leadership and magnifies the effects of maneuver, firepower, and protection. Today, ARFOR use information collected to increase their situational understanding before engaging the enemy. Information from the COP and running estimates, transformed into situational understanding, allows commanders to combine the elements of combat power in new ways.

THE FOUNDATIONS OF ARMY OPERATIONS

3-12. Understanding the principles of war and tenets of Army operations is fundamental to operating successfully across the range of military operations. The principles of war and tenets of Army operations form the foundation of Army operational doctrine. (Refer to FM 3-0 for a full description of the Principles of War and Tenets of Army Operations.)

- **The Principles of War** provide general guidance for conducting war and military operations other than war at the strategic, operational, and tactical levels. The principles are the enduring bedrock of Army doctrine.
- **The Tenets of Army Operations** build upon the principles of war. They further describe the characteristics of successful operations. These tenets are essential to victory.

THE OPERATIONAL FRAMEWORK

3-13. The operational framework consists of the arrangement of friendly forces and resources in time, space, and purpose with respect to each other and the enemy or situation. It consists of the **AO, battlespace**, and the **battlefield organization**. The framework establishes an area of geographic and operational responsibility and provides a way for commanders to visualize how to employ forces against the enemy. Commanders design an

operational framework to accomplish their mission by defining and arranging its three components. They use the framework to focus combat power. The operational framework provides a mechanism through which the commander can focus the Intelligence BOS effort. Understanding the operational framework, AOIR, and intelligence coordination line (ICL) and their relationship to each other is key to planning and executing ISR operations.

- **AO** is an operational area defined by the JFC for land and naval forces. AOs do not typically encompass the entire operational area of the JFC but should be large enough for component commanders to accomplish their missions and protect their forces. AOs should also allow component commanders to employ their available systems to the limits of their capabilities. The AO is the basic control measure for all operations that defines the geographical area for which a particular unit is responsible. The commander—
  - Assumes responsibility for intelligence, maneuver, fires, terrain management, security, and movement within his AO.
  - Establishes control measures within his AO to assign responsibilities, coordinate intelligence, fires, and maneuver, and to control other activities.
- **Battlespace** is the environment, factors, and conditions that must be understood to successfully apply combat power, protect the force, or complete the mission. This includes air, land, sea, space, and the included enemy and friendly forces; facilities; weather; terrain; the EMS; and the information environment within the operational areas and AOIs. The G2/S2 performs IPB and synchronizes ISR activities throughout the battlespace as determined by the commander's METT-TC considerations.
  - Area of influence is the geographical area in which a commander can directly influence operations by maneuver of FS systems normally under the commander's command or control. Areas of influence surround and include the associated AO.
  - AOI is that area of concern to the commander, including the area of influence, areas adjacent thereto, and extending into enemy territory to the objectives of current or planned operations. This area also includes areas occupied by enemy forces who could jeopardize the accomplishment of this mission. (See JP 1-02.)
  - Information environment refers to a commander's battlespace that encompasses information activity affecting the operation. To envision that part of the information environment that is within their battlespace, commanders determine the information activities that affect their own operational capabilities and opposing C2 and information systems.
  - Force Projection Bases are the intermediate staging bases and power projection platforms.
  - Home Stations are the permanent locations of active and RC units. To a significant degree, events occurring at home station affect the morale and performance of deployed forces. Thus, the commander's battlespace encompasses all home station functions.

- **Battlefield Organization** is the allocation of forces in the AO by purpose. It consists of three all-encompassing categories of operations:
  - Decisive Operations are those that directly accomplish the task assigned by higher headquarters. Decisive operations conclusively determine the outcome of major operations, battles, and engagements.
  - Shaping Operations are operations at any echelon that create and preserve conditions for the success of decisive operations.
  - Sustaining Operations are operations at any echelon that enable shaping and decisive operations by providing CSS, rear area and base security, movement control, terrain management, and infrastructure development.

3-14. AOIs extend into enemy territory, to the objectives of current or planned operations. They include areas occupied by enemy forces that could jeopardize the accomplishment of the mission. AOIs also serve to focus intelligence development and IO directed at factors outside the AO that may affect the operation. (FM 3-0, para 4-79) The scheme of support includes the coordination of reconnaissance and surveillance missions and AOIs with a joint force or higher headquarters and lateral units to answer the intelligence requirements within the AOI. The G2/S2 monitors enemy activities within the AOI and provides intelligence on enemy activities that may affect the unit.

3-15. The AOIR is an area allocated to a commander in which the commander is responsible for the provision of intelligence within the means at the commander's disposal. It is an area allocated to the commander in which the commander is responsible for the collection of information concerning the threat and the environment and the analysis of that information in order to produce intelligence. Higher headquarters also ensure through intelligence handovers, collection management, and deconfliction that problems with duplication, confliction, and command and control do not occur in the AOIR. (FM 2-19.402/FM 34-80-2) They include the available ISR assets, capability of the G2/S2 section, available intelligence architecture, and METT-TC considerations. The AOIR cannot extend beyond a unit's AOI; however, it can be smaller than its AO as well as vary (expand or contract) during an operation. An example of when a unit's AOIR is smaller than its AO is when a higher headquarters ISR effort covers an area within the unit's AO.

3-16. ICLs designate the boundary between AOIRs. The G2/S2 establishes ICLs to facilitate coordination between higher, lateral, and subordinate units; coordinates with the G3/S3 to direct subordinates to track enemy units and HPTs in their areas; and hands over intelligence responsibility for areas of the battlefield. The establishment of ICLs ensures that there are no gaps in the collection effort; that all echelons are aware of the location, mission, and capabilities of other assets. The G2/S2 keeps abreast of collection activities in progress (all echelons) and battlefield developments through the ICLs. ICLs help—

- Facilitate coordination between higher, lateral, and subordinate units.

- Ensure higher, lateral, and subordinate units share information and intelligence as enemy entities and HPTs move into, within, or transition between AOIRs.
- Specify intelligence responsibility for areas of the battlefield.

ARMY CAPABILITIES

3-17. Commanders combine AC and RC ARFOR—consisting of different types of units with varying degrees of modernization—with multinational forces and civilian agencies to achieve effective and efficient unified action. A broad range of organizations makes up the institutional Army that supports the field Army. Institutional Army organizations design, staff, train, and equip the force. The institutional Army assists in effectively integrating Army capabilities. It does this through leadership and guidance regarding force structure, doctrine, modernization, and budget. (See FM 100-11.)

TASK ORGANIZATION

3-18. The Army supports JFCs by providing tailored force packages to accomplish joint missions and dominate enemies and situations on land. Trained and equipped AC and RC units comprise these force packages. Within these force packages, Army commanders organize groups of units for specific missions. They reorganize for subsequent missions when necessary. This process of allocating available assets to subordinate commanders and establishing their command and support relationships is called task organizing. A temporary grouping of forces designed to accomplish a particular mission is a task organization. The ability of ARFOR to tailor (select forces based upon a mission) and task organize (temporarily organize units to accomplish a tactical mission) gives them extraordinary agility. It allows operational and tactical level commanders to organize their units to make the best use of available resources. The ability to task organize means ARFOR can shift rapidly among offensive, defensive, stability, and support operations.

COMBINED ARMS

3-19. The fundamental basis for the organization and operations of ARFOR is combined arms. Combined arms is the synchronized or simultaneous application of several arms—such as infantry, armor, field artillery, engineers, air defense, and aviation—to achieve an effect on the enemy that is greater than if each arm was used against the enemy separately or sequentially. The ultimate goal of Army organization for operations remains success in joint and combined arms warfare. Its combined arms capability allows commanders to form Army combat, combat support (CS), and CSS forces into cohesive teams focused on common goals.

COMMAND AND SUPPORT RELATIONSHIPS

3-20. Establishing clean command and support relationships is fundamental in organizing for all operations. These relationships can achieve clear responsibilities and authorities among subordinate and supporting units. The commander designates command and support relationships within his authority to weigh the decisive operation and support his scheme of maneuver. Some forces available to a commander are given command or support relationships that limit his authority to prescribe additional relationships. Command and support relationships carry with them varying responsibilities to the subordinate unit by parent and gaining units. By knowing the inherent responsibilities of each command and support relationship, a commander may organize his force to establish clear relationships.

3-21. Command relationships establish the degree of control and responsibility commanders have for forces operating under their tactical control (TACON). When commanders establish command relationships, they determine if the command relationship includes administrative control (ADCON). Figure 3-1 shows command and support relationships.

3-22. Support relationships define the purpose, scope, and effect desired when one capability supports another. Support relationships establish specific responsibilities between supporting and supported unit. Army support relationships are direct support (DS), general support (GS), general support-reinforcing (GSR), and reinforcing.

3-23. While not an actual C2 function, technical control often affects certain intelligence operations. Technical control ensures adherence to existing policies or regulations and provides technical guidance for MI activities, particularly HUMINT, SIGINT, and CI operations. Commanders direct operations but often rely on technical expertise to plan, prepare, execute, and assess portions of the unit's collection effort. Technical control also involves translating ISR tasks into the specific parameters used to focus highly technical or legally sensitive aspects of the ISR effort. Technical control includes, but is not limited to—

- Defining, managing, or guiding the employment of specific ISR assets.
- Identifying critical technical collection criteria such as technical indicators.
- Recommending collection techniques, procedures, or assets.
- Conducting operational reviews.
- Conducting operational coordination.
- Conducting specialized training for specific MI personnel or units.

3-24. An example of technical control is the Prophet control team converting the PIR and SOR sets from the MDMP process and assigning times and anticipated enemy frequencies for subordinate Prophets to collect.

IF RELATIONSHIP IS:		INHERENT RESPONSIBILITIES ARE:

	General Support (GS)	Parent unit	Parent unit	Parent unit	Parent unit	As required by parent unit	As required by parent unit	Parent unit	Not Applicable

NOTE 1. In NATO, the gaining unit may not task organize a multinational unit (see TACON).

NOTE 2. Commanders of units in DS may further assign support relationships between their subordinate units and elements of the supported unit after coordination with the supported commander.

Figure 3-1. Army Command and Support Relationships and Inherent Responsibilities.

Chapter 4

Intelligence Process in Full Spectrum Operations

THE INTELLIGENCE PROCESS

4-1. Commanders use the operations process of plan, prepare, execute, and assess to continuously design and conduct operations (see Figure 4-1). The commander cannot successfully accomplish the activities involved in the operations process without information and intelligence. The design and structure of intelligence operations support the commander's operations process by providing him with intelligence regarding the enemy, the battlefield environment, and the situation.

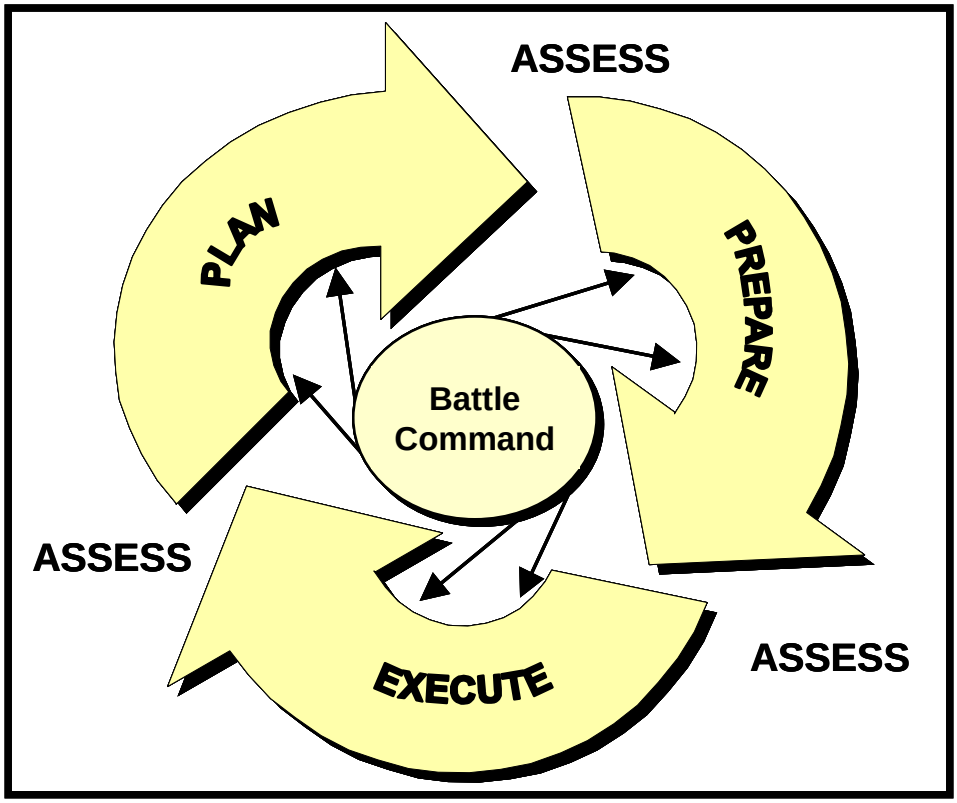

Figure 4-1. The Operations Process.

4-2. Intelligence operations consist of the functions that constitute the intelligence process: **plan, prepare, collect, process, produce**, and the three common tasks of **analyze, disseminate,** and **assess**. Just as the activities of the operations process overlap and recur as circumstances demand, so do the functions of the intelligence process. Additionally, the analyze, disseminate, and assess functions of the intelligence process occur continuously throughout the intelligence process.

4-3. The operations process and the intelligence process are mutually dependent. The commander, through the operations process, provides the guidance and focus through CCIRs and PIRs that drives the intelligence process; the intelligence process provides the continuous intelligence essential to the operations process. Intelligence about the enemy, the battlefield environment, and the situation allows the commander and staff to develop a plan, seize and retain the initiative, build and maintain momentum, and exploit success (see Figure 4-2). The intelligence process is just one of the mechanisms that provides input to build the COP and facilitate the commander's situational understanding.

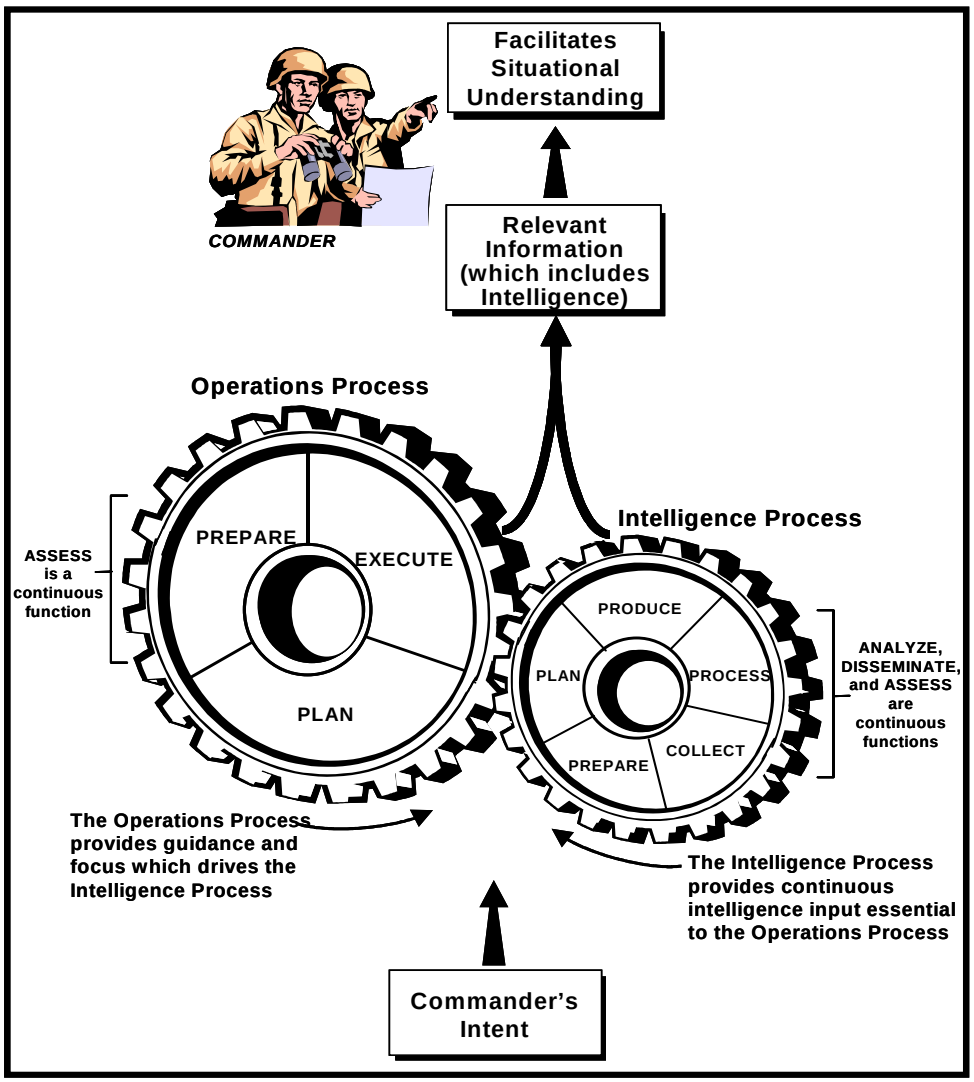

Figure 4-2. The Relationship Between the Operations and Intelligence Processes.

PLAN

4-4. The planning step of the intelligence process consists of activities that include assessing the situation, envisioning a desired outcome (also known as setting the vision), identifying pertinent information and intelligence requirements, developing a strategy for ISR operations to satisfy those requirements, directing intelligence operations, and synchronizing the ISR effort. The commander's intent, planning guidance, and CCIRs (PIRs and FIRs) drive the planning of intelligence operations. Planning, managing, and coordinating these operations are continuous activities necessary to obtain information and produce intelligence essential to decisionmaking.

COORDINATE

4-5. Staff and leaders coordinate with various elements, units, and organizations to ensure the necessary resources, linguist support (see Appendix B), information, intelligence, training, and procedures are in place to facilitate effective intelligence operations.

- Coordination for Movement of ISR Assets. All ISR assets at one time or another will move through or near another unit's AO. To avoid fratricide, ISR elements must coordinate with units, G3/S3, G2/S2, and each other, as well as coordinate with the fire support officer (FSO) to establish no-fire areas and/or other control measures around ISR assets and the air defense officer (ADO) in reference to aerial ISR assets in order to establish the appropriate weapons control status.
- Coordination for Information and Intelligence. The intelligence staff must prepare and practice coordination with personnel from all MI units, non-MI units, other service components, and multinational organizations that may contribute to or facilitate the collection effort. This coordination enables the G2/S2 to share and update databases, information, and intelligence and ensures connectivity with those organizations. All units are sources of relevant information regarding the enemy and the operational environment.
- Liaison. In order to accomplish the mission, exchange information and intelligence, move through certain areas and ensure FP, it may be necessary to coordinate with many different elements, organizations, and local nationals of the country in which friendly forces are conducting operations. Local nationals include police, town officials, foreign military forces, and political and other key figures within the AO. Operations may also necessitate coordination with other US and multinational forces; for example, the International Police Task Force (IPTF), Joint Commission Observers (JCO), Organization for Security and Cooperation in Europe (OSCE), Allied Military Intelligence Battalion (AMIB), and Defense HUMINT Service (DHS).
- Movement. Coordination with the G3/S3 ensures ease of movement and safe passage of friendly forces through an area. Coordinating movement also helps avoid fratricide.

INTELLIGENCE BOS CONSIDERATIONS

4-6. The Intelligence BOS is a unified system that anticipates and satisfies intelligence needs. Commanders ensure its proper employment by clearly articulating intent, designating CCIRs (PIRs and FFIRs), and prioritizing targets. Commanders must, however, understand the limitations of the Intelligence BOS to preclude unrealistic expectations of the system. The following are Intelligence BOS limitations:

- Intelligence only reduces uncertainty on the battlefield; it does not eliminate it entirely. The commander will always have to determine the presence and degree of risk involved in conducting a particular mission.
- The Intelligence BOS is composed of finite resources and capabilities. Intelligence systems and soldiers trained in specific ISR skills are limited in any unit. Once lost to action or accident, these soldiers and systems are not easily replaceable; for some, it may not be possible to replace them during the course of the current operation. The loss of soldiers and equipment can result in the inability to detect or analyze enemy actions. The loss of qualified language-trained soldiers, especially soldiers trained in low-density languages or skills, could adversely affect intelligence operations as well.
- The Intelligence BOS cannot effectively and efficiently provide intelligence without adequate communications equipment, capacity, and connectivity. Commanders and G2/S2s must ensure communications support to intelligence has the appropriate priority.
- Commanders and G2/S2s cannot expect that higher echelons will automatically send them everything they need. While intelligence reach is a valuable tool, the push of intelligence products from higher echelons does not relieve subordinate staffs from conducting detailed analysis and focusing the efforts of higher headquarters. Nor can they expect products pushed to them to be always at the level of detail they require. Commanders and G2/S2s must focus higher echelons by clearly articulating and actively pursuing intelligence requirements. By providing higher echelons with a clear picture of the required intelligence products, commanders can also narrow the flow of intelligence and information and preclude being overwhelmed by too much information.

4-7. Commanders should be aware that intelligence collection is enabled by, and subject to, laws, regulations, and policies to ensure proper conduct of intelligence operations. While there are too many to list here specifically, categories of these legal considerations include United States Codes (USCs), Executive Orders, National Security Council Intelligence Directives (NCSIDs), Army Regulations, United States Signal Intelligence Directives (USSIDs), SOFAs, ROE, and other international laws and directives.

PREPARE

4-8. The prepare step includes those staff and leader activities which take place upon receiving the OPORD, OPLAN, WARNO, or commander's intent

to improve the unit's ability to execute tasks or missions and survive on the battlefield. These activities include—

- Effecting necessary coordination in accordance with the OPORD, METT-TC, unit SOP.
- Establishing and testing the intelligence architecture. This activity includes complex and technical issues like hardware, software, communications, COMSEC materials, network classification, technicians, database access, liaison officers (LNOs), training, funding, and TTP.
- Establishing an intelligence team attitude. This activity includes knowing different unit's and organization's capabilities, training the necessary collective skills, establishing effective relationships with different units and organizations, developing mutual battle rhythms and TTP, and leveraging the right architectures and collaboration tools.
- Coordinating effective analytic collaboration. Effective analytic collaboration is necessary to maximize the complementary analytic capabilities of different units and organizations that produce intelligence within the same theater of operations. Coordinating this collaboration is an effort-intensive activity that requires careful mutual planning, division of labor, defined responsibilities, and procedures for adapting to changing circumstances as they develop.
- Establishing reporting procedures.
- Conducting IPB.
- Producing Intelligence Estimates.
- Presenting briefings.
- Ensuring staff and personnel are trained. If personnel are not adequately trained at this point, they must be trained or the leader must evaluate the risk they bring to the operation.
- Planning refinement, brief-backs, SOP reviews, rehearsals, and coordinating with various elements and organizations.
- Establishing other troop-leading procedures (TLPs) or coordination, as necessary, in accordance with METT-TC factors.

G2/S2 PREPARATION ACTIVITIES

4-9. The G2/S2 takes numerous steps before mission execution to ensure intelligence operations run smoothly and effectively. These steps include, but are not limited to, the following:

- Conduct rehearsals.
- Conduct communication rehearsals.
- Review and update available databases and IPB products.
- Review applicable SOPs, Army Regulations, DA Pamphlets, Field Manuals, and ROE for guidance in conducting intelligence operations.
- Plan and practice actions supporting likely contingencies, or the branches or sequels to an operation.
- Ensure coordination measures are still in effect.
- Ensure training (individual and collective).

- Verify communications protocols with theater and higher headquarters and subordinate and lateral units.
- Update intelligence databases.
- Update the forces with the most recent intelligence on the AO immediately before mission execution.

VERIFICATION

4-10. Coordination for or requesting provisions or services is only the first step in acquiring them. It is crucial that staff and leaders check to verify that procedures, personnel, equipment, and services are in place and ready for mission execution.

REHEARSALS

4-11. Rehearsals help units prepare for operations by either verifying that provisions and procedures are in place and functioning or identifying inadequacies, which staff and leaders must remedy. They allow participants in an operation to become familiar with and to translate the plan into specific actions that orient them to their environment and other units when executing the mission. They also imprint a mental picture of the sequence of key actions within the operation and provide a forum for subordinate and supporting leaders and units to coordinate. (FM 6-0)

REPORTING PROCEDURES

4-12. The timely and accurate reporting of CCIRs (PIRs and FFIRs) and IRs is key to successful operations. All assets should know when, how often, and what format to use when reporting. The G2/S2 must verify the frequencies, alternate frequencies, and reactions during jamming, as well as the LTIOV for specific information to be reported. Unit SOPs provide the proper reporting procedures.

4-13. The G2/S2 coordinates with the unit staff, subordinate and lateral commands, and higher echelon units to ensure that specific reporting assets, personnel, equipment (especially communications), and procedures are in place. The G2/S2 requests or establishes the appropriate message addresses, routing indicators, mailing addresses, and special security office (SSO) security accreditation for units.

COMMUNICATIONS

4-14. Staff and leaders must work closely with the G6/S6 or signal officer (SIGO) to coordinate for the required communication links. The unit may require classified and unclassified network connections for their equipment. If elements of the unit will be working outside the range of the unit's communications systems, then it is necessary to coordinate for global or extended range communications. Leaders must obtain the required type and amount of communications equipment and related components as well as the latest fills and frequencies. They must possess and be familiar with all the instructions, passwords, policies, regulations, and directives conducive to OPSEC. They must also ensure soldiers are trained in the use and procedures involved in operating communications equipment.

SITUATION UPDATES

4-15. Each staff section and element conducts activities to maximize the operational effectiveness of the force. Coordination and preparation are just as important, if not more important, as developing the plan. Staff preparation includes assembling and continuously updating estimates. For example, continuous IPB provides accurate situational updates for commanders.

INTELLIGENCE HANDOFF

4-16. A well-executed intelligence hand-off will ensure a smooth and seamless transition between units. It is important that the incoming unit becomes familiar with the operation as soon as possible to avoid compromising the intelligence production and flow of the mission. The following are points to consider during a mission hand-off:

- Briefings and reports (learn what briefings are required and when as well as report formats and requirements).
- Past, present, and planned activities within the AOI.
- Established SOPs (know procedures for reporting; intelligence contingency funds [ICFs] and incentive use if applicable; emplacement and use of ISR equipment).
- Key personalities (introductions are required; establish rapport and a good working relationship with all key personalities).
  - Key personnel on the base or camp (their responsibilities; how to contact them).
  - Key personnel in other US and multinational service components (coordinate for exchange of information and intelligence).
  - Key personalities from surrounding towns (local figures).
  - Key national level political and military figures.
- Supporting units (know where to go for provisions, information, or assistance and POCs within those organizations).
- Current attitudes (understand current attitudes and perspectives of the local populace).
- Equipment operation and idiosyncrasies (equipment may run on different applications; personnel may need to train on specific equipment and procedures).
- Area familiarization (identify NAIs, key terrain, minefields, and boundaries; know camp locations, routes and route names, checkpoints, towns, and troubled resettlement areas).

RULES OF ENGAGEMENT

4-17. Although ROE training was presented during the plan function of the intelligence process, leaders at all levels can take the opportunity during the prepare function to ensure their subordinates completely understand the ROE. It is also during this function that commanders may need to consider exceptions to, or modifications of, the ROE to facilitate HUMINT and CI collection or to enable the placement of ISR assets.

COLLECT

4-18. Recent ISR doctrine necessitates that the entire staff, especially the G3/S3 and G2/S2, must change their reconnaissance and surveillance mind-set to conducting ISR. The staff must carefully focus ISR on the CCIR (PIR and FFIR) but also enable the quick retasking of units and assets as the situation changes. This doctrinal requirement ensures that the enemy situation not just our OPLAN "drives" ISR operations. Well-developed procedures and carefully planned flexibility to support emerging targets, changing requirements, and the need to support combat assessment is critical. The G2/S2 and G3/S3 play a critical role in this challenging task that is sometimes referred to as "fighting ISR" because it is so staff intensive during planning and execution (it is an operation within the operation). Elements of all units on the battlefield obtain information and data about enemy forces, activities, facilities, and resources as well as information concerning the environmental and geographical characteristics of a particular area.

ISR TASKS

4-19. ISR tasks are the actions of the intelligence collection effort. ISR tasks consists of three categories:

- Intelligence.
- Surveillance.
- Reconnaissance.

4-20. Intelligence tasks are included in Annex B of the OPORD under Scheme of Intelligence. They include the following:

- **Intelligence Production**. Intelligence production includes analyzing information and intelligence and presenting intelligence products, conclusions, or projections regarding the OE and enemy forces in a format that enables the commander to achieve situational understanding.
- **Request for Information**. Submitting an RFI to the next higher or lateral echelon is the normal procedure for obtaining intelligence information not available through the use of available ISR assets. Users enter RFIs into an RFI management system where every other user of that system can see it. Hence, an echelon several echelons above the actual requester becomes aware of the request and may be able to answer it. A G2/S2 who receives an RFI from a subordinate element may use intelligence reach to answer RFIs.
- **Intelligence Reach**. Intelligence reach allows the commander to access the resources of national, joint, foreign, and other military organizations and units. Requestors can acquire information through push and pull of information, databases, homepages, collaborative tools, and broadcast services. (See Chapter 2 for more information on intelligence reach.)

4-21. For information on reconnaissance or surveillance tasks, refer to FM 7-15 and FM 3-55.

SPECIAL RECONNAISSANCE

4-22. Special reconnaissance (SR) is the complementing of national and theater intelligence collection assets and systems by obtaining specific, well-defined, and time-sensitive information of strategic or operational significance. It may complement other collection methods where there are constraints of weather, terrain, hostile countermeasures, and/or other systems availability. SR places US or US-controlled personnel conducting direct observation in hostile, denied, or politically sensitive territory when authorized. SOF may conduct these missions unilaterally or in support of conventional operations. (See JP 3-05 and FM 101-5-1.)

4-23. Army Special Operations Forces (ARSOF) elements conduct SR missions to obtain information not available through other means. SR operations encompass a broad range of collection activities to include reconnaissance, surveillance, and TA. SR complements national and theater collection systems that are more vulnerable to weather, terrain masking, and hostile countermeasures. SR missions provide intelligence or information that is often not available through other means. Typical SR missions include—

- TA and surveillance of hostile C2 systems, troop concentrations, deep-strike weapons, lines of communication (LOCs), WMD systems, and other targets.
- Location and surveillance of hostage, prisoner of war, or political prisoner detention facilities.
- Post-strike reconnaissance for BDA.
- Meteorologic, geographic, or hydrographic reconnaissance to support specific air, land, or sea operations.

4-24. For more information on special reconnaissance, see FM 3-05.102.

REPORTING

4-25. The most critical information collected is worthless if not reported in a timely manner. Collectors may report information via verbal, written, graphic, or electronic means. Unit SOPs must clearly state the transmission means of different types of reports (for example, sent by voice frequency modulated [FM] radios or by automated means). In general, the transmission of reports for enemy contact and actions, CCIRs, exceptional information, and NBC reports is by voice FM, and then followed up with automated reports. Commanders and staffs must remember that timely reporting, especially of enemy activity, is critical in fast-moving operations. Collectors must report accurate information as quickly as possible. Commanders and staff must not delay reports for the sole purpose of editing and ensuring the correct format. This is particularly true for reporting information or intelligence that answers the PIR.

TIME-SENSITIVE REPORTING

4-26. Intelligence and time-sensitive combat information that affects the current operation is disseminated immediately upon recognition. Combat information is unevaluated data, gathered by or provided directly to the tactical commander which, due to its highly perishable nature or the

criticality of the situation, cannot be processed into tactical intelligence in time to satisfy the user's tactical intelligence requirements. Thus combat information is provided directly to the tactical commander (see JP 1-02). The routing of combat information proceeds immediately in two directions: directly to the commander and through routine reporting channels, which include intelligence analysis and production elements.

4-27. Time-sensitive information usually includes reports concerning enemy contact and actions and CCIRs.

PROCESS

4-28. The process function converts relevant information into a form suitable for analysis, production, or immediate use by the commander. Processing also includes sorting through large amounts of collected information and intelligence (multidiscipline reports from the unit's ISR assets, lateral and higher echelon units and organizations, and non-MI elements in the battlespace). Processing identifies and exploits that information which is pertinent to the commander's intelligence requirements and facilitates situational understanding. Examples of processing include developing film, enhancing imagery, translating a document from a foreign language, converting electronic data into a standardized report that can be analyzed by a system operator, and correlating dissimilar or jumbled information by assembling like elements before the information is forwarded for analysis.

4-29. Often collection assets must collect and process their data prior to disseminating it. MI systems have their own reporting and processing systems, the details of which are in the appropriate MI system manuals and technical manuals. Some collection assets, particularly air reconnaissance and ground scouts, can report relevant information that is immediately usable by the tactical commander (for example, for targeting purposes). However, the personnel in the reporting chain still process these reports by evaluating their relevancy and accuracy. In many cases, the output of a collection asset is data, or information of limited immediate use to a commander. Also, in certain situations ROE dictate a requirement for target confirmation by other sources.

4-30. The intelligence staff processes information collected by the unit's assets as well as that received from higher echelons. The intelligence staff processes many types of information and data from intelligence reach, unmanned aerial vehicle (UAV) imagery, radar imagery, mobile target indicators (MTIs), and HUMINT and SIGINT reports.

PRODUCE

4-31. In the production step, the G2/S2 integrates evaluated, analyzed, and interpreted information from single or multiple sources and disciplines into finished intelligence products. Like collection operations, the G2/S2 must ensure the unit's information processing and intelligence production are prioritized and synchronized to support answering the CCIRs (PIRs and FFIRs).

4-32. Intelligence products must be timely, relevant, accurate, predictive, and usable. The accuracy and detail of every intelligence product has a direct

effect on how well the unit plans and prepares for operations. However, the G2/S2 and unit must use intelligence (no matter what form the intelligence is in) that meets the requirements but might not be as detailed or refined as possible or in a better form. A good answer on time is better than a more refined answer that is late.

4-33. The G2/S2 produces intelligence for the commander as part of a collaborative process. The commander drives the G2/S2's intelligence production effort by establishing intelligence and IRs with clearly defined goals and criteria. Differing unit missions, environments, and situations impose numerous and varied production requirements on the G2/S2 and his staff.

4-34. The G2/S2 must employ collaborative analysis techniques and procedures that leverage intelligence production capability of higher and subordinate echelons to meet these requirements. Proficiency in these techniques and procedures enables the G2/S2 to answer the commander's and staff's requirements regardless of the mission, environment, and situation. The G2/S2 and staff intelligence products enable the commander to—

- Plan operations and employ maneuver forces effectively.
- Recognize potential COAs.
- Employ effective tactics and techniques.
- Take appropriate security measures.
- Focus ISR.

COMMON INTELLIGENCE PROCESS TASKS

ANALYZE

4-35. Analysis occurs at various stages throughout the intelligence process. Personnel conducting intelligence operations at all levels analyze intelligence, information, and problems to produce intelligence, solve problems and, most importantly, answer the PIRs. Leaders at all levels conduct analysis to assist in making many types of decisions. An example is a HUMINT collector analyzing an intelligence requirement in order to determine the best possible collection strategy to use against a specific source.

4-36. Analysis in RM is critical to ensuring the IRs receive the appropriate priority for collection. The intelligence staff analyzes each requirement to determine its feasibility, whether or not it supports the commander's intent, and to determine the best method of satisfying the IRs. The staff also analyzes collected information to determine if it satisfies requirements.

4-37. During the produce function, the intelligence staff analyzes information from multiple sources to develop all-source intelligence products. The intelligence staff analyzes information and intelligence to ensure the focus, prioritization, and synchronization of the unit's intelligence production is in accordance with the PIRs.

4-38. In situation development, the intelligence staff analyzes information to determine its significance relative to predicted ECOAs and the CCIRs (PIRs and FFIRs). Through predictive analysis, the staff attempts to identify enemy activity or trends that represent opportunities or risks to the friendly force.

They use the indicators developed for each ECOA and CCIRs (PIRs and FFIRs) during the MDMP as the basis for their analysis and conclusions.

DISSEMINATE

4-39. Successful operations at the tactical and operational levels require an increased ability to synchronize fires, have faster access to intelligence, and enhance situational understanding and effective FP. Timely and accurate dissemination of intelligence is key to the success of these and other operations. Commanders must receive combat information and intelligence products in time and in an appropriate format to support decisionmaking. Additionally, sharing the most current all-source information and intelligence at all echelons is essential for commanders to maintain situational understanding.

4-40. To achieve this, it is imperative that the commander and staff establish and support a seamless intelligence architecture—including an effective dissemination plan—across all echelons to ensure information and intelligence flow in a timely manner to all those who need them. Intelligence and communications systems continue to evolve in their sophistication, application of technology, and accessibility to the commander. Their increasing capabilities also create an unprecedented volume of information available to commanders at all echelons. Finally, the commander and staff must have a basic understanding of these systems and how they contribute to the Intelligence BOS. A dissemination plan can be a separate product, or integrated into existing products such as the ISR synchronization plan or ISM, the decision support template (DST), or decision support matrix (DSM).

Dissemination Procedures

4-41. The G2/S2 and intelligence personnel at all levels assess the dissemination of intelligence and intelligence products.

4-42. Disseminating intelligence simultaneously to multiple recipients is one of the most effective, efficient, and timely methods. This can be accomplished through various means; for example, push, broadcast. However, within the current tactical intelligence architecture, reports and other intelligence products move along specific channels. The staff helps streamline information distribution within these channels by ensuring dissemination of the right information in a timely manner to the right person or element. There are three channels through which commanders and their staffs communicate: command, staff, and technical.

4-43. **Command Channel**. The command channel is the direct chain-of-command link that commanders, or authorized staff officers, use for command-related activities. Command channels include command radio nets (CRNs), video teleconferences (VTC), and the Maneuver Control System (MCS).

4-44. **Staff Channel**. The staff channel is the staff-to-staff link within and between headquarters. The staff uses the staff channel for control-related activities. Through the staff channel, the staff coordinates and transmits intelligence, controlling instructions, planning information, provides early warning information, and other information to support C2. Examples of staff

channels include the operations and intelligence radio net, telephone, the staff huddle, VTC, and the BOS-specific components of the Army Battle Command System (ABCS).

4-45. **Technical Channel**. Staffs typically use technical channels to control specific combat, CS, and CSS activities. These activities include fire direction and the technical support and sensitive compartmented information (SCI) reporting channels of intelligence and ISR operations. The SIGINT tasking and reporting radio net, intelligence broadcast communications, and the wide area networks (WANs) supporting single intelligence discipline collection, processing, and production are examples of technical channels.

Presentation Techniques and Procedures

4-46. The staff's objective in presenting information is to provide the commander with relevant information. Table 4-1 lists the three general methods that the staff uses to present information and meet its information objective. Systems within the ABCS contain standard report formats, maps, and mapping tools that assist the staff in presenting information in written, verbal, and graphic form. Audio and video systems such as large format displays and teleconferencing systems enable the staff to use a combination of the methods in multimedia presentations.

Table 4-1. Presentation Methods and Products.

Method	Products
Written Narrative	Reports, Estimates, and Studies
Verbal Narrative	Briefing (information, decision, mission, and staff)
Graphic	Charts, Overlays, and Electronic Displays

Intelligence Communications Architecture

4-47. The intelligence communications architecture transmits intelligence and information to and from various ISR elements, units, and agencies by means of automation and communication systems. With the continued development of sensors, processors, and communications systems, it is increasingly important to understand the requirements of establishing an effective communications architecture. The G2/S2 must identify the Intelligence BOS specific requirements of the unit's overall communications architecture. Refer to FM 2-33.5 for more information on intelligence communications reach. The following are some (but not all) of the questions which the staff must answer in order to establish the intelligence communications architecture:

- Where are the unit's collectors?
- What and where are the unit's processors?
- Where are the unit's intelligence production elements?
- Where are the unit's decisionmakers?
- How does the unit disseminate information from its producers to its decisionmakers and/or consumers?

- Are the systems which the unit's collectors, producers, processors, and consumers use compatible with each other? If not, what is the plan to overcome this challenge?
- How can the unit access databases and information from higher and other agencies?

ASSESS

4-48. Assessment is the continuous monitoring—throughout planning, preparation, and execution—of the current situation and progress of an operation, and the evaluation of it against criteria of success to make decisions and adjustments. Assessment plays an integral role in all aspects of the intelligence process. Assessing the situation and available information begins upon receipt of the mission and continues throughout the intelligence process. The continual assessment of intelligence operations and ISR assets, available information and intelligence, the various aspects of the battlefield environment, and the situation are critical to—

- Ensure the CCIRs (PIRs and FFIRs) are answered.
- Ensure intelligence requirements are met.
- Redirect collection assets to support changing requirements.
- Ensure operations run effectively and efficiently.
- Ensure proper use of information and intelligence.
- Identify enemy efforts at deception and denial.

4-49. During planning, the intelligence staff conducts a quick initial assessment of the unit's intelligence posture and holdings, status of intelligence estimates, and any other available intelligence products. From this assessment the commander issues his initial guidance and a WARNO.

4-50. While the majority of the unit is engaged in preparation, the ISR effort should already have begun. It is during this period when the prepare and execute activities of the operations process overlap, that the G2/S2 assesses the current situation as well as the progress of ISR operations.

4-51. During execution the intelligence staff continues assessing the effectiveness of the ISR effort while at the same time assessing the results and products derived from the collection effort. The critical aspects of assessment at this point include determining whether the PIRs have been answered, will be answered with the current ISR operations, or which ISR operations to adjust in order to answer the CCIRs (PIRs and FFIRs). This type of assessment requires sound judgment and a thorough knowledge of friendly military operations, characteristics of the AO and AOI, and the threat situation, doctrine, patterns, and projected future COAs.

PART THREE

Military Intelligence Disciplines

Part Three provides a more detailed explanation of the intelligence disciplines introduced in Part One of this manual.

Chapter 5 defines and discusses the roles and fundamentals of the all-source intelligence discipline.

Chapter 6 defines and discusses the roles, fundamentals, and generic organization of the HUMINT discipline.

Chapter 7 defines and discusses the roles, fundamentals, and generic organization of the IMINT discipline.

Chapter 8 defines and discusses the roles, fundamentals, and generic organization of the SIGINT discipline.

Chapter 9 defines and discusses the roles, fundamentals, and generic organization of the MASINT intelligence discipline.

Chapter 10 defines and discusses the roles, fundamentals, and generic organization of the TECHINT discipline.

Chapter 11 defines and discusses the roles, fundamentals, and generic organization of the CI discipline.

Chapter 5

All-Source Intelligence

DEFINITION

5-1. All-source intelligence is defined as the intelligence products, organizations, and activities that incorporate all sources of information and intelligence, including open-source information, in the production of intelligence. All-source intelligence is a separate intelligence discipline, as well as the name of the function used to produce intelligence from multiple intelligence or information sources.

ROLE

5-2. The operational environment provides an ever-growing volume of data and information available from numerous sources, from which the commander can use to achieve situational understanding. His situational

understanding enables him to make decisions in order to influence the outcome of the operation; prioritize and allocate resources; assess and take risks; and understand the needs of the higher and subordinate commanders. The commander depends upon a skilled G2/S2 working within his intent to support his ISR effort and provide all-source intelligence analysis conclusions and projections of future conditions or events.

FUNDAMENTALS

5-3. All-source intelligence production satisfies intelligence requirements. It provides an overall picture of the adversary and the battlespace. It reduces the possibility of error, bias, and misinformation through the use of multiple sources of information and intelligence.

PLAN

5-4. The utilization of all-source intelligence facilitates the development of accurate and concise contingency-specific plans, orders, and intelligence products. Additionally, the G2/S2 must retrieve, update, or develop any required intelligence databases. The most important all-source products are the modified combined obstacle overlay (MCOO), event templates, ECOA sketches, and the HPT list provided during initial IPB in support of the plan function. Through all-source intelligence, the commander can make informed decisions about COAs and adversary capabilities.

5-5. The intelligence staff coordinates its efforts with other elements such as the engineer terrain team, the unit surgeon, the Air Force weather team, and other assets or elements that can support the analytical effort.

5-6. IPB plays a significant role in the planning phase of the intelligence process. It is a systematic, continuous process of analyzing the threat and environment and is designed to support staff estimates and the MDMP. The IPB is led by the G2/S2, with participation by the entire staff. IPB allows the commander and staff to make informed decisions, develop COAs, and focus ISR efforts where they are most needed. IPB continuously assists the commander and staff in focusing ISR assets on the appropriate targets at critical points in time and space.

5-7. The time available for the IPB process may not permit the luxury of conducting each step in detail. Overcoming time limitations requires the commander to identify those parts of IPB that are most important to the commander in planning and executing his mission. Applying the specific steps or degree of detail performed varies according to METT-TC. There are four steps in the IPB process: define the battlefield environment, describe the battlefield's effects, evaluate the threat, and determine ECOAs.

Define the Battlefield Environment

5-8. In this step, the G2/S2—

- Identifies characteristics of the battlefield that will influence friendly and threat operations including terrain (mobility), weather, hydrological data, infrastructure, and civilian demographics. Produces accurate, timely, and predictive IPB products that depict the aspects of the battlefield.

- Identifies the limits of the command's AO and AOI.
- Identifies gaps in current intelligence holdings, identifies IRs, and recommends CCIRs (PIRs and FFIRs).

5-9. Defining the battlefield environment includes identifying enemy forces (their location, mobility, general capabilities, and weapon ranges) and all other aspects of the environment that could have an effect on the unit's ability to accomplish the mission. Depending on the situation, these considerations may also include—

- Geography, terrain, and weather of the area.
- Information environment to include but not limited to computer and communications systems and capabilities, data acquisition systems and capabilities, media access and distribution, areas prone to electromagnetic interferences, and systems to generate electromagnetic interference.
- Population demographics (ethnic groups, religious sects, age distribution, health status, income groups).
- Medical threat to include but not limited to endemic and epidemic diseases, occupational and environmental health hazards, and poisonous and toxic plants and animals.
- Political or socio-economic factors, including factions, clans, and gangs.
- Infrastructures, such as transportation or telecommunications, and critical decisionmaking infrastructures and supporting information systems.
- ROE or legal restrictions, such as international treaties or agreements.

Describe the Battlefield's Effects

5-10. This IPB step deals with the effects of the battlefield environment on the current operations and potential enemy and friendly COAs. It begins with the assessment of existing and projected conditions of the battlefield environment, which the staff accomplishes through terrain analysis, weather analysis, and analysis of other characteristics of the battlefield. To conduct terrain analysis, the staff uses maps, reconnaissance, and other specialized terrain products (maps, overlays, databases, software). These products address such factors as wet or dry cross-country mobility, transportation systems (road and bridge information), vegetation type and distribution, surface drainage and configuration, surface materials (soils), ground water, manmade structures, and obstacles. The results of evaluating the terrain's effects should be expressed by identifying areas of the battlefield that influence each COA.

Evaluate the Threat

5-11. Evaluating the threat involves determining the threat force capabilities and the doctrinal principles and TTP that threat forces prefer to employ. The result of this evaluation produces a threat model, which portrays how threat forces normally execute operations and how they have reacted to similar situations in the past. The threat model includes an evaluation of the threat's strengths, weaknesses, and vulnerabilities, including an evaluation of typical HVTs.

Determine ECOAs

5-12. Determining ECOAs involves the identification and development of likely ECOAs that will influence accomplishing the friendly mission. Developing ECOAs is a form of predictive intelligence analysis and production. The procedures for this step include—

- Identifying the enemy's likely objectives and predicting the desired end-state.
- Identifying the full set of COAs available to the enemy.
- Predicting the enemy's most likely and most dangerous COAs.
- Evaluating and prioritizing each COA.
- Developing each COA in the amount of detail that time permits.
- Identifying initial ISR and collection requirements.

5-13. After conducting the initial IPB, the staff, primarily the G2/S2, identifies gaps in the available intelligence, develops the initial PIRs and IRs, and develops the initial input to the ISR plan based on the commander's guidance.

5-14. Indicators are the basis for situation development. Indicators are activities that will confirm or deny the event specified in an intelligence requirement. They are any positive or negative evidence of enemy activity or characteristic of the AO that points toward enemy capabilities, vulnerabilities, or intentions. Individual indicators cannot stand alone. Each indicator is integrated with other factors and indicators before patterns are detected and enemy intentions established. Indicators are developed by the analysts in the G2/S2 section. The event matrix shows the threat activities, or indicators, to look for in each NAI, and the timelines during which each NAI should be active. All indicators are developed to answer the commander's PIRs and IRs. The analyst uses indicators to correlate particular events or activities with probable ECOAs and to determine what events or activities must occur for an enemy to follow a particular COA. The ability to read indicators (including recognition of enemy deception indicators) contributes to the success of friendly operations. The analyst integrates information from all sources to confirm indicators of enemy activities. As indicators are detected and confirmed, PIRs are answered.

PREPARE

Activities

5-15. All-source activities during the prepare function include—

- Conducting rehearsals.
- Conducting communications rehearsals and verifiying communications protocols with higher, lateral, and subordinate units.
- Planning and practicing actions that support likely contingencies, branches, or sequels.
- Reviewing and updating available databases and IPB products.
- Ensuring control and coordination measures are still in effect.

- Updating the force with the most recent intelligence before mission execution.

Intelligence Estimates

5-16. The intelligence estimate is a continuous process that is the product of all actions the intelligence staff performs throughout the MDMP. The intelligence estimate provides a timely and accurate evaluation of the enemy and the AO (and often the AOIR) at a given time. It provides the background the G2/S2 uses to portray enemy actions during COA analysis.

5-17. The G2/S2 must clearly understand the weather and terrain effects and the ability to visualize the battlespace before producing the intelligence estimate. This understanding facilitates accurate assessments and projections regarding the enemy: enemy situation (including strengths and weaknesses), enemy capabilities and an analysis of those capabilities (COAs available to the enemy), and conclusions drawn from that analysis. The intelligence estimate's conclusion identifies the enemy's most likely COA and most dangerous COA. ECOAs must include a sketch of the COA with a task and purpose for the enemy's actions. Any gaps in the intelligence estimate are identified as information requirements.

5-18. The intelligence estimate may be written or oral. At the tactical level, especially during operations and exercises, intelligence estimates are usually delivered orally, supported by graphic displays and other decision support tools. During contingency planning, especially at corps level and above, estimates are usually written. During deliberate planning at joint headquarters, estimates are always written (see JP 5-00.2). However, the intelligence estimate should always be prepared as thoroughly as time and circumstances permit. A comprehensive intelligence estimate considers both the tangible (quantifiable) and the intangible aspects of the enemy's operations. It translates enemy strengths, weapon systems, training, morale, and leadership into combat capabilities and projections of future enemy actions.

5-19. Different sections of the intelligence estimate receive more emphasis during different activities within the operations process.

- During planning, the most important decision the commander makes is selecting a COA on which to base the plan. Thus, the sections of the intelligence estimate that focus on the commander's selecting the most appropriate COA are the most important at that time.
- During preparation, the intelligence estimate must focus on the commander's decisions that affect the ability of the unit to execute the upcoming operation. The intelligence estimate—and functions—that supports these decisions must focus on answering the CCIRs (PIRs and FFIRs) and guiding the ISR effort.
- During execution, the intelligence estimate focus is to support the anticipated command decisions. The most important action of the intelligence estimate—and the ISR effort— is to answer the PIR. However, it is also during the execution phase that the intelligence estimate must look ahead: anticipating branches or sequels to the

current operation, transition to other operations, changes in the ECOAs, and required adjustments to the ISR effort.

5-20. Refer to FM 2-01 for examples of intelligence estimates.

COLLECT

5-21. The collect intelligence process function within the all-source intelligence discipline is limited to gathering the necessary information, intelligence, and intelligence products required to perform analysis. Thus, all-source intelligence depends upon the other intelligence disciplines to perform collection. This is also the primary reason why OSINT is defined as a source of information and intelligence and not a separate intelligence discipline.

PROCESS

5-22. The process function converts relevant information into a form suitable for analysis, production, or immediate use by the commander. Processing also includes sorting through large amounts of collected information and intelligence to identify and exploit the information which is pertinent to the commander's intelligence requirements and facilitates situational understanding.

PRODUCE

5-23. All-source intelligence analysis and production—

- Drives collection to answer the PIR.
- Provides the enemy situation.
- Provides INTSUMs and other intelligence reports.
- Supports situational understanding.
- Provides predictive estimates of enemy actions; specifically, ECOAs.
- Provides continuously updated IPB.
- Provides all-source target packages (or folders).

5-24. As previously stated, the intelligence estimate is a continuous process. The commander and staff constantly collect, process, store, display, and disseminate information. Staff members update their estimates as they receive new information, such as—

- When they recognize new facts.
- When they replace assumptions with facts or find their assumptions invalid.
- When they receive changes to the mission or when changes are indicated.

5-25. Technological advances and NRT information allow estimates to be continuously updated; the running estimate and its intelligence component, the intelligence running estimate, exemplify this.

Running Estimate

5-26. Running estimates are continuously updated estimates based on new information as the operation proceeds. They serve as a staff technique to support the commander's visualization and decisionmaking, as well as the

staff's tool for assessing during preparation and execution. In the running estimate, staff officers continuously update their conclusions and recommendations as they evaluate the impact of new facts. Current doctrine emphasizes the COP as the primary tool that provides the current situation and, when merged with the running estimates, facilitates commanders achieving situational understanding. All staff sections (BOSs) provide their respective input to the COP. The COP as used today, combined with the running estimate, is predictive and enhances our current ability to collect, process, store, display, and disseminate information.

5-27. The portion of the COP that depicts the enemy situation is currently limited to displaying the locations and dispositions of enemy and threat forces in a relatively static manner, sometimes referred to as snapshots in time. The enemy situation portion of the COP requires analysis to provide the required level of detail. The COP and running estimates sufficiently provide effective support for battle command of knowledge-based organizations.

5-28. The main differentiation between the running estimate and the old staff estimates is the emphasis on not only continuously updating the facts of the estimate but also continuously updating the conclusions and recommendations while including projections of future conditions of the entire battlespace. While the COP is primarily a display of current intelligence and information, the running estimate requires the merging of the staff's cognitive processes with automation applications. The primary focus of the staff's cognitive process is to present predictive or anticipatory intelligence in support of the commander's decisionmaking or situational understanding. See Figure 5-1.

5-29. The running estimate is a product of the entire battle staff. Just as all BOSs contribute to the COP, they will also contribute their portion of the running estimate. The running estimate integrates the running estimates from each BOS. The Intelligence BOS input to the running estimate is the intelligence running estimate.

Intelligence Running Estimate

5-30. The intelligence running estimate is a continuous flow and presentation of relevant information and predictive intelligence that, when combined with the other staff running estimates, enables the decisionmaker's visualization and situational understanding of the AOI in order to achieve information superiority. The intelligence running estimate requires constant verification to support situational understanding of the current situation as well as predictive assessments for future operations.

5-31. While it is possible to employ the concept of the intelligence running estimate today, the true seamless and continuous update feature will be achieved with technological enablers that are not yet present in the force. In the future, technology should allow the information from the running estimate to become implanted as a part of the COP. However, there will always be a place for some separate context, orally or written, separate from the COP display to add fidelity and assist in the commander's visualization and decisionmaking. Additional training must be implemented not just

within MI but also throughout the force in order to institute the running estimate concept.

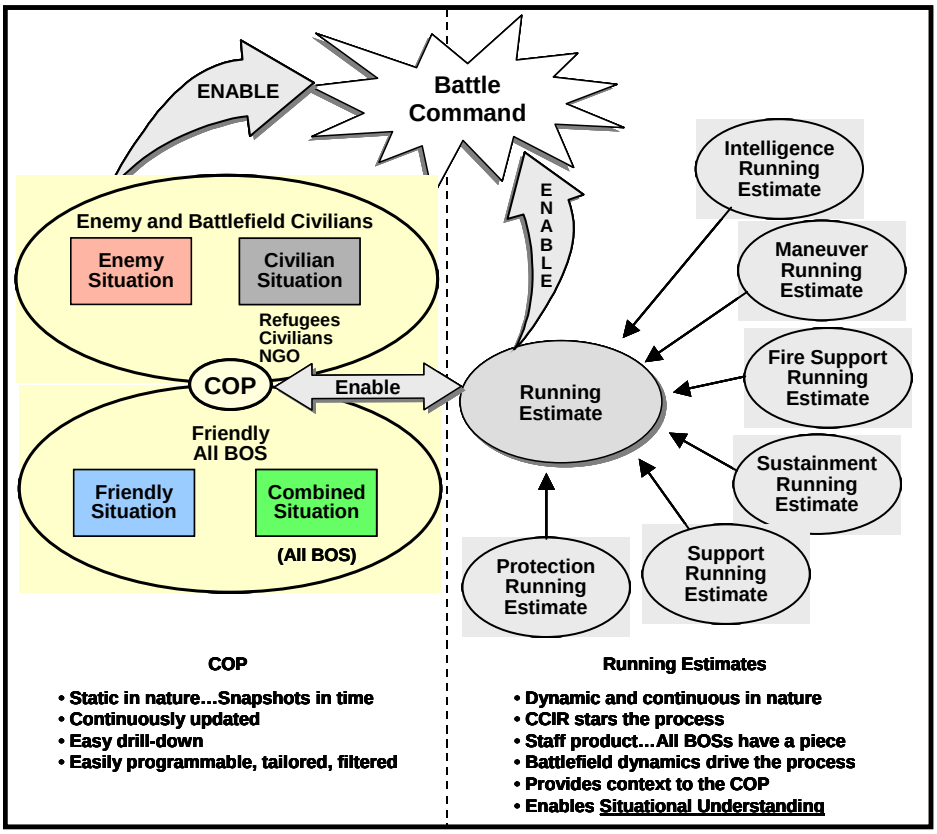

Figure 5-1. Example of the COP and a Running Estimate.

ANALYZE

5-32. Analysis is key in converting combat information and all intelligence from each discipline into all-source intelligence products and targeting information. From the multiple sources of information received, the staff analyzes and identifies critical information; determines the relevancy and accuracy of the information; and reaches conclusions about the information. These conclusions are either immediately disseminated or are used to form the basis of intelligence analysis products.

DISSEMINATE

5-33. The intelligence staff extracts and disseminates pertinent intelligence from products developed as a result of all-source analysis. The intelligence staff—

- Rapidly disseminates time-sensitive, all-source analysis intelligence and intelligence products to higher, lateral, and subordinate commands in order to keep all commanders abreast of current developments in the situation and battlespace in accordance with unit SOPs.

- Disseminates all-source analysis intelligence to other G2/S2 intelligence activities for additional processing or detailed analysis and exploitation in accordance with unit SOPs.

5-34. For intelligence reach operations all-source intelligence products are available and disseminated in a variety of forms. It is incumbent on the requestor to ensure that the all-source product can be transmitted over the available communications systems. This includes verifying the appropriate security level of the communication system.

ASSESS

5-35. The commander, the intelligence staff, and the intelligence consumers assess the analysis, production, and dissemination of all-source intelligence. The staff identifies intelligence gaps, emerging operational requirements, duplication of effort, or new targets or threats and redirects all-source activities as appropriate to meet intelligence requirements. Throughout the assessment process, the G2/S2, the intelligence staff, and intelligence users should be alert for evidence of possible enemy denial and deception efforts. The staff assesses intelligence and information for—

- Consistency with the current situation and threat trends.
- Accuracy and confirmation by other intelligence sources or disciplines.
- Source reliability and credibility.
- Pertinence to PIRs, intelligence requirements, RFIs, and other intelligence tasks or requests.

Chapter 6

Human Intelligence

DEFINITION

6-1. HUMINT is the collection by a trained HUMINT Collector of foreign information from people and multimedia to identify elements, intentions, composition, strength, dispositions, tactics, equipment, personnel, and capabilities. It uses human sources as a tool and a variety of collection methods, both passively and actively, to gather information to satisfy the commander's intelligence requirements and cross-cue other intelligence disciplines.

ROLE

6-2. The role of HUMINT Collectors is to gather foreign information from people and multiple media sources to identify adversary elements, intentions, composition, strength, dispositions, tactics, equipment, personnel, and capabilities. It uses human sources and a variety of collection methods to gather information to satisfy the commander's intelligence requirements, and cross-cue other intelligence disciplines.

HUMINT FUNCTIONS

6-3. HUMINT functions are interrelated, mutually supporting, and can be derived from one another. No single function or technical capability can provide a full understanding of our adversaries. HUMINT functions are defined below and shown in Figure 6-1.

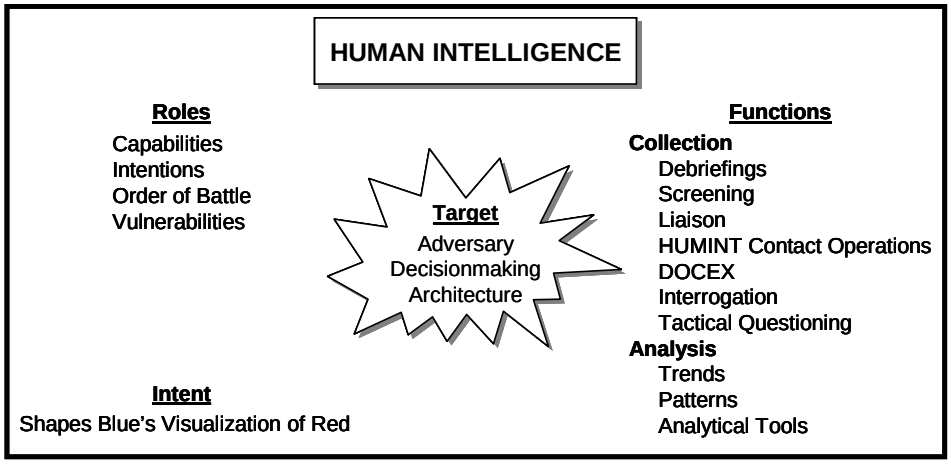

Figure 6-1. HUMINT Roles and Functions.

COLLECTION

6-4. HUMINT collection methods and operations include—

- **Debriefings.** Debriefings are the systematic questioning of individuals to procure information to answer specific collection requirements by direct and indirect questioning techniques. Sources for debriefings are categorized as friendly forces, US and non-US civilians to include refugees, displaced persons, and local inhabitants.
- **Screening.** Screening is the process of evaluating and selecting human and media sources for the prioritized collection of information in support of commander's PIRs and IRs. Screening categorizes and prioritizes sources based on the probability of a particular source having priority information and the degree of difficulty of extracting that information from the source. While screening is not in itself an information collection technique, it is vital to the rapid collection of information.
- **Liaison.** HUMINT elements conduct liaison with US, multinational, and HN military and civilian agencies, to include NGOs. Liaison is conducted to obtain information of interest and to coordinate or deconflict HUMINT activities.
- **HUMINT Contact Operations.** HUMINT contact operations are tactically oriented, overt collection activities that use human sources to identify attitude, intentions, composition, strength, dispositions, tactics, equipment, target development, personnel, and capabilities of those elements that pose a potential or actual threat to US and multinational forces. These forces provide early warning of imminent danger to US and multinational forces and contribute to the MDMP.
- **Document Exploitation (DOCEX).** DOCEX is the systematic extraction of information from all media formats in response to collection requirements.
- **Interrogation.** Interrogation is the systematic effort to procure information to answer specific collection requirements by direct and indirect questioning techniques of persons who are in the custody of the forces conducting the questioning.

UNIT SUPPORT TO HUMINT COLLECTION

6-5. Small units contribute to HUMINT collection through a number of different ways.

Tactical Questioning

6-6. Tactical questioning can provide critical information for situational understanding. Tactical questioning is the expedient initial questioning for information of immediate tactical value. Soldiers conduct tactical questioning based on the unit's SOP, ROE, and the order for that mission. Unit leaders must include specific guidance for tactical questioning in the order for appropriate missions. The unit S3 and S2 must also provide specific guidance down to the unit level to help guide tactical questioning. For a more detailed discussion of tactical questioning, see ST 2-91.6.

Combat Patrolling

6-7. Through observing and interacting with the local environment during the conduct of missions, handling EPWs/detainees, and handling captured documents, soldiers serve as the commander's "eyes and ears" whether—

- Performing traditional offensive or defensive operations.
- Performing a patrol in a stability operation.
- Manning a TCP or a roadblock in a support operation.
- Occupying an observation post.
- Passing through an area in a convoy.
- Performing any operation that involves observing and reporting on elements of the environment and activities in the AO.

ISR Operations

6-8. The information that the soldier reports as a result of completed missions up the chain of command forms a vital part of planning and operations. Careful and quick handling of EPWs/detainees and documents also helps the ISR effort. Unit headquarters must ensure that the reports they receive and forward contain all the subtle detail provided by the small unit. For tactical operations, there are four levels of reporting:

- Immediate reporting of information of critical tactical value, based either on predetermined criteria or common sense.
- Normal reporting, submitted before the unit S2 section performs the debriefing.
- Debriefing performed by the S2 section.
- Follow-up reporting, submitted after the unit S2 section performs the debriefing.

6-9. The four levels of reporting facilitate the unit S2 section capturing all the fine details of the small unit's activities for all-source analysis and future planning. The unit S2 must ensure that information of HUMINT and CI value is reported to the G2X.

ANALYSIS

6-10. IPB, all-source, and single-source analysis are used to template adversarial OB. HUMINT elements analyze operational taskings to determine the best collection methods to employ in satisfying CCIRs (PIRs and FFIRs) and IRs. As information is collected, it is analyzed for completeness and accuracy to identify significant facts for subsequent interpretation and inclusion in intelligence products, and passing to other collectors. This analysis also helps to identify collection gaps and focus or refocus collection efforts. Analysis provides the commander with situational understanding of the battlespace to execute operations. Raw information, open-source material, and finished intelligence products are analyzed in response to local and national requirements. Analysis occurs at all levels from tactical to strategic.

- At the tactical level, HUMINT teams focus their efforts on supporting mission requirements and contributing to the all-source COP.

- Operational analysis is used to assess adversary intentions, capabilities, dispositions, and their regional impacts.
- Strategic analysis supports national and Army programs through compilation of local and regional analysis into global assessments; identifies technology development trends and patterns in military activities and capabilities.

6-11. HUMINT products consist of, but are not limited to, target nomination, input to threat and vulnerability assessments, intelligence estimates, and intelligence information reports. Finalized intelligence derived from HUMINT activities is incorporated into joint and national intelligence databases, assessments, and analysis products. HUMINT products are also incorporated into the COP to support situational awareness. HUMINT production takes place at all levels.

- Operational and tactical production includes tactical alerts, spot reports, and current intelligence; input to threat and/or vulnerability assessments tailored to specific activities, units, installations, programs or geographic areas, and target studies to support contingency planning and major exercises; studies of military activities and capabilities.
- Strategic products include assessments supporting national and Army information requirements on foreign technology development; worldwide assessments of the organization, location, funding, training, operations capabilities and intentions of terrorist organizations; analyses of the capabilities of international narcotics trafficking organizations.

OPERATIONAL EMPLOYMENT

6-12. Army HUMINT must support the full spectrum of military operations. Commanders require a well-trained HUMINT force consisting of AC, RC, civilian government, and contractor personnel. The HUMINT force is focused on and dedicated to the collection of data and information relevant to the commander's PIRs and IRs. Effective employment of Army HUMINT elements in all phases of operations and at all levels from tactical to strategic will remain paramount to ensuring that commanders have the best pictures possible of their adversaries. HUMINT Collectors use the following collection methods.

LEVELS OF EMPLOYMENT

6-13. **Strategic and Departmental.** Strategic and departmental operations will be conducted by HUMINT elements supporting national, DOD, and DA required missions (for example, support to NATO and special operations and missions). The Army strategic HUMINT force resides in DHS. Trained Army HUMINT professionals must be available to augment DOD HUMINT efforts and coordinate between Army and Joint or DOD elements during crisis and war. Strategic HUMINT activities are generally carried out by departmental level HUMINT elements or Army HUMINT assets directly assigned to DOD and Joint positions. The Army overt HUMINT capability at the strategic

level will be deployed and under operational control (OPCON) of the Army Service Component Commander (ASCC).

6-14. **Operational.** HUMINT operational missions must support combatant commanders, generally in geographic AORs. Operational HUMINT assets provide capabilities to support theater requirements for HUMINT collection. Operational HUMINT elements will focus on threat identification and capabilities. As with all levels of employment, HUMINT activities and functions will include DOCEX, collection, operations, analysis, and production. HUMINT elements must be capable of quickly transitioning from a peacetime mission to crisis operations to support combatant commander requirements. Operational elements may also be deployed to support or reinforce tactical forces in CONOPS.

6-15. **Tactical.** Army HUMINT play a crucial role in supporting tactical forces. HUMINT teams conduct operations throughout the battlespace during CONOPS. CONOPS support activities include debriefings, screenings, contact operations, and interrogations. HUMINT activities in CONOPS focus on the threat and assisting the senior intelligence officer (SIO) and commander in understanding the threat's decisionmaking process. During peacetime, organic tactical HUMINT teams conduct activities pursuant with approved regulations and command guidance.

SUPPORT TO CONTINGENCY OPERATIONS

6-16. **Initial Phase.** The initial phase of operations from peacetime military engagement (PME) to major theater war (MTW) lays the foundation of future team operations. In general, the priority of effort focuses inward on security of operating bases, areas of troop concentration, and C2 nodes to identify the collection threat to US forces that could be used by adversarial elements to plan hostile acts against US activities and locations.

6-17. **Continuation Phase.** Once security of the operating bases has been established, the operational focus of HUMINT teams shifts outside the operating base to continue to detect, identify, and neutralize the collection threat to US forces as well as to provide I&W of hostile acts targeting US activities. The HUMINT team uses several collection methods, to include HUMINT contact operations, elicitation, and liaison, to answer the supported commander's requirements.

6-18. **HUMINT Team.** A key element to the HUMINT team's success is the opportunity to spot, assess, and develop relationships with potential sources of information. Operating as independent teams, without being tied to combat assets, enables the HUMINT team's maximum interaction with the local population, thereby maximizing the pool of potential sources of information. A second key element of a HUMINT team's success is its approachability to the local population. A soft posture enables a HUMINT team to appear as non-threatening as possible. Experience has shown that the local population in general is apprehensive of fully and openly armed patrols and soldiers moving around population centers. During some operations civilian attire or non-tactical vehicles may be used to lower the

HUMINT team profile. NOTE: In some special situations, these measures are taken to make the operation less visible to the casual observer. Also, in some cultures, sharing food and beverages among friends is expected; exceptions to restrictions or general orders should be considered to facilitate successful HUMINT team operations, many of which are geared towards developing relationships with potential sources of information.

SUPPORT TO INSTALLATIONS AND OPERATING BASES

6-19. Commanders may restrict personnel to base camps and installations during the initial stages of operations (PME to MTW), when the operational environment is being assessed, or as a temporary expedient when the threat level exceeds the ability to provide reasonable FP. Operational restrictions minimize the risk to the HUMINT team, but minimizing its collection potential may increase the risk to the force as a whole. While confined to an installation or a base camp, the HUMINT team can maintain a limited level of information collection by—

- Screening locally employed personnel.
- Debriefing combat and ISR patrols.
- Debriefing friendly force personnel who are in contact with the local population.
- Conducting limited local open-source information collection.
- Contributing to the threat and vulnerability assessments of the base camp.

TACTICS, TECHNIQUES, AND PROCEDURES

6-20. At the HUMINT team level, team members conduct mission analysis and planning specific to their AO. Backwards planning and source profiling are used extensively to choose HUMINT targets. To verify adequate area coverage, the HUMINT team may periodically develop and use HUMINT target overlays and other HUMINT analytical tools that illustrate the HUMINT situation, identify gaps, and help refocus the collection effort.

6-21. The HUMINT team is also in constant contact with the supported S2 and the other ISR assets (Scouts, PSYOP, CA, and MPs) in order to coordinate and deconflict operations and to cross-check collected information. The supported unit S2, with the help of the HUMINT team, regularly and systematically debriefs all ISR assets.

6-22. The HUMINT team must be integrated into the supported unit's ISR plan. The HUMINT operational management team (OMT) chief will advise the supported unit on the specific capabilities and requirements of the team to maximize mission success.

OPERATIONAL RISK MITIGATION

6-23. The employment of HUMINT teams includes varying degrees of contact with the local population. As the degree of contact with the population increases, both the quantity and quality of collection increases. In many instances, however, there is a risk to the team inherent with increased exposure to the local population. The decision at what level to employ a team is METT-TC dependent. The risk to HUMINT assets must be balanced with

the need to collect priority information and to protect the force as a whole. ROE, SOFA, direction from higher headquarters, and the overall threat level may also restrict the deployment and use of HUMINT teams. The commander should consider exceptions to the ROE to facilitate HUMINT collection.

6-24. Risks are minimized through the situational awareness of HUMINT team members. They plan and rehearse to readily react to any situation and carry the necessary firepower to disengage from difficult situations. If it becomes necessary to call for assistance, adequate and redundant communications equipment is critical. These scenarios and actions should be trained prior to deployment into a contingency area and rehearsed continuously throughout the deployment.

6-25. A supported unit commander is often tempted to keep the HUMINT team "inside the wire" when the threat condition (THREATCON) level increases. The supported commander must weigh the risk versus potential information gain when establishing operational parameters of supporting HUMINT teams. This is necessary especially during high THREATCON levels when the supported unit commander needs as complete a picture as possible of the threat arrayed against US and multinational forces.

6-26. When it is not expedient to deploy the HUMINT team independently due to threat levels or other restrictions, the team can be integrated into other ongoing operations. The HUMINT team may be employed as part of a combat, ISR, or MP patrol or used to support CA, PSYOP, engineer, or other operations. This method reduces the risk to the team while allowing a limited ability to collect information. It has the advantage of placing the team in contact with the local population and allowing it to spot, assess, and interact with potential sources of information. However, this deployment method restricts collection by subordinating the team's efforts to the requirements, locations, and timetables of the unit or operation into which it is integrated and does not allow for the conduct of sensitive source operations. **This method of employment should be considered a last resort.**

HUMINT EQUIPMENT

6-27. Basic C2, transportation, and weapons requirements do not differ significantly from most soldier requirements and are available as unit issue items. However, HUMINT teams have unique communications, collection, processing, and mission-specific requirements.

COMMUNICATIONS

6-28. Dedicated and secure long-range communications are key to the success of the HUMINT team mission. HUMINT team operations require a secure, three-tiered communications architecture consisting of inter/intra-team radios, vehicle-based communications, and a CI and HUMINT base station.

6-29. The HUMINT team must have access to existing communications networks such as the tactical local area network (LAN). The HUMINT team must also be equipped with its own COMSEC devices. It is imperative that the HUMINT team acquire access to the public communication system of the HN. This can be in the form of either landlines or cellular telephones. Such

access enables the HUMINT team to develop leads which can provide early indicators to US forces.

Interoperability

6-30. Communications systems must be equipped with an open-ended architecture to allow for expansion and compatibility with other service elements, government organizations, NGOs, and multinational elements to effectively communicate during CONOPS. All ISR systems must be vertically and horizontally integrated to be compatible across all BOSs and with Legacy and Interim Force elements.

Satellite Communications On-The-Move (SOTM)

6-31. To provide real time or NRT information reporting, HUMINT elements must have the capability to transmit voice, data, imagery, and video while on the move. HUMINT teams must be able to transmit while geographically separated from their parent unit while operating remotely. This broadband requirement can only be achieved through a SATCOM capability and must be achievable while mobile.

HUMINT COLLECTION AND PROCESSING SYSTEMS

6-32. The HUMINT team must rely on automation to achieve and maintain information dominance in a given operation. With time, effective collection planning and management at all echelons, the HUMINT team can collect a wealth of information. The sorting and analysis of this information in a timely and efficient manner is crucial to operations. Automation helps the HUMINT team to report, database, analyze, and evaluate the collected information quickly and to provide the supported unit with accurate data in the form of timely, relevant, accurate, and predictive intelligence.

6-33. Automation hardware and software must be user friendly as well as interoperable among different echelons and services. They must interface with the communications equipment of the HUMINT team as well as facilitate the interface of audiovisual devices. Technical support for hardware and software must be available and responsive.

6-34. The demand for accurate and timely HUMINT reporting, DOCEX, and open-source information has grown tremendously. Biometric (physiological, neurological, thermal analysis, facial and fingerprint recognition) technologies will allow rapid identification; coding and tracking of adversaries and human sources; and cataloging of information concerning enemy prisoners of war (EPWs), detainees, and civilians of HUMINT interest on the battlefield. Biometrics will also provide secure authentication of individuals seeking network or facility access.

6-35. HUMINT teams work with multinational forces, and other foreign nationals, and require the ability to communicate in their respective languages. Often HUMINT personnel have little or no training in the target language, and lack of skilled interpreters can hinder HUMINT activities. HUMINT teams require textual and voice translation devices, source verification, and deception detection machines (biometrics) to improve collection capability and accuracy.

6-36. HUMINT teams require dynamic machine language translation (MLT) tools that provide both non-linguists and those with limited linguist skills a comprehensive, accurate means to conduct initial screenings and basic interviews in a variety of situations. HUMINT elements will focus on in-depth interviews and communications with persons of higher priority. MLT tools will minimize reliance on contract linguists and will allow soldiers to concentrate on mission accomplishment.

MISSION SPECIFIC

6-37. The HUMINT team may conduct night operations and must be equipped with NVDs for its members and photographic and weapons systems. The HUMINT team also may operate in urban and rural areas, where the threat level can vary from semi-hostile to hostile. The safety of the HUMINT team can be enhanced with equipment that can detect, locate, suppress, illuminate, and designate hostile optical and E-O devices. In addition, high power, gyro-stabilized binoculars, which can be used from a moving vehicle, also increase the survivability of the HUMINT team. It also gives the team another surveillance and collection device.

6-38. Some of the HUMINT team missions may require the documentation of incidents. The teams can use the following equipment in their open-source collection efforts.

- Small, rugged, battery-operated digital camcorders and cameras which are able to interface with the collection and processing systems as well as communication devices.
- GPSs that can be mounted and dismounted to move in the AO efficiently.
- Short-range multichannel RF scanning devices that can also identify frequencies which enhance their security.

6-39. In some cases HUMINT teams require a stand-off, high resolution optical surveillance and recording capability that can provide target identification at extended ranges to protect the intelligence collector while avoiding detection by the adversary target. An advanced optical capability provides intelligence collectors the ability to locate and track adversarial targets (passive and hostile) for identification, collection, and target exploitations.

INTEGRATION OF LINGUISTS

6-40. Integrating linguists into the HUMINT team should take place as soon as possible. Security clearances and contractual agreements will help the team determine the level of integration.

6-41. Along with the basic briefing of what is expected of the civilian linguists as interpreters, HUMINT teams should be informed about the civilians' chain of command and the scope of their duties beyond interpreting. The HUMINT team leader must ensure that linguists are trained and capable of completing all tasks expected of them.

BATTLE HAND-OFF

6-42. HUMINT teams are always engaged. A good battle hand-off is critical to smooth transition and mission success. The battle hand-off can directly contribute to mission success or failure of the outgoing team, but especially of the incoming team. The battle hand-off begins the first day the HUMINT team begins to operate in an AO. Regardless of how long the team believes it will operate within the AO, it must ensure there is a seamless transition to an incoming team, other US unit, or agency. The HUMINT team accomplishes this transition by establishing procedures for source administration, database maintenance, and report files.

6-43. Teams must plan and implement a logical and systematic sequence of tasks to enable an incoming team to assume the operations in the AO. Adequate time must be allotted for an effective battle hand-off. In some environments, a few weeks may be necessary to accomplish an effective battle hand-off. Introductions to sources of information, especially HUMINT contact operations sources, are critical and teams must prioritize their time. During this time the outgoing HUMINT team must familiarize the new HUMINT team with all aspects of the operation, which includes past, present, and planned activities within the AO. Area orientation is critical. These include major routes, population centers, potential hot spots, and other points of interest (such as police stations, political centers, and social centers).

ORGANIZATION

6-44. HUMINT activities require a complex C2 relationship to ensure that the requirements of the supported commander are fulfilled while balancing the need for strict integrity and legality of HUMINT operations. This complex relationship balances the role of the SIO as the requirements manager and the *2X as the mission manager with the MI commander as the asset manager. ("*2X" indicates 2X functions at all levels.)

COMMAND VERSUS CONTROL

6-45. ARFOR will normally deploy as part of a joint and/or multinational operation. In all cases, commanders at each echelon will exercise command over the forces assigned to their organization. Command includes the authority and responsibility for effectively using resources, planning for and employment of forces, and ensuring that forces accomplish assigned missions. Leaders and staffs exercise control to facilitate mission accomplishment.

6-46. While the MI commander supervises subordinates and produces reports, the *2X synchronizes activities between intelligence units and provides single-source processing and limited analysis. While the MI commander takes care of the operators executing missions, the *2X obtains the data and reports from higher echelons required to execute the missions.

STAFF RESPONSIBILITIES AND FUNCTIONS

*2X Staff

6-47. The *2X staff is responsible for the integration, correlation, and fusion of all Human Sensor information into the Intelligence BOS within the *2X

AOIR. The *2X is also responsible for analyzing adversary collection, terrorist and sabotage activities, developing countermeasures to defeat threat collection activities, identifying and submitting collection requirements to fill collection gaps, and providing input to the all-source picture regarding adversary intelligence activities.

*2X Staff Officer

6-48. The *2X Staff Officer provides CI and HUMINT collection expertise. The *2X—

- Is the single focal point for all matters associated with CI and HUMINT in the AOIR.
- Is the CI and HUMINT advisor to the G2 and commander.
- Is an extension of the collection manager and ensures that the best asset or combinations of assets are used to satisfy information requirements.
- Along with his subordinate elements (CICA, HOC, OSC, CI Analysis Cell [CIAC], and HAC), exercises technical control over his assigned Army CI and HUMINT elements in the designated AOIR.
- Is the principal representative of the G2 and the commander when coordinating and deconflicting CI and HUMINT activities with national or theater agencies operating in the AOIR.
- Supports specific RM efforts in conjunction with the requirements manager through—
  - Planning and coordinating CI and HUMINT operations.
  - Reviewing and validating HUMINT requirements.
  - Recommending assignment of tasks to specific collectors.
  - Conducting liaison with non-organic HUMINT collection. This liaison includes national level and multinational force assets for source deconfliction and special activities outside the *2X AOIR.
- Will provide OMTs with capability to reach back to current database information, technical information and guidance, and source deconfliction necessary to monitor the collection activities of the HUMINT teams.

The HUMINT Analysis Cell (HAC)

6-49. The HAC is the single-source fusion point for all HUMINT reporting and operational analysis. It determines gaps in reporting and coordinates with other analysis teams and technical controllers to cross-cue other collection sensor systems. The HAC—

- Uses analytical tools to develop long-term collection plans and provides reporting feedback that supports all HUMINT and CI entities in the supported command's AOIR.
- Produces and disseminates HUMINT products and provides input to intelligence summaries.
- Uses analytical tools found at the ACE or JISE to develop long-term analyses and provides reporting feedback that supports the J/G/S2X, HUMINT operations section, OMTs, and HUMINT teams.
- Produces country and regional studies tailored to HUMINT collection.

- Compiles target folders to assist J/G/S2X assets in focusing collection efforts.
- Analyzes and reports on trends and patterns found in HUMINT reporting.
- Analyzes source reliability and credibility as reflected in reporting and communicating that analysis to the collector.
- Develops and maintains databases specific to HUMINT collection activities that directly support the collection efforts of HUMINT teams and are directly accessible by HUMINT teams.
- Provides collection requirements input to the HOC.
- Supports RM through the development of HUMINT SIRs based on command PIRs.
- Answers HUMINT-related RFIs.

6-50. For intelligence reach operations, HUMINT products are available and disseminated in a variety of forms. It is incumbent on the requestor to ensure that the HUMINT product can be transmitted over the available communications systems. This includes verifying the appropriate security level of the communications systems.

HUMINT Operations Cell (HOC)

6-51. The HOC in the *2X coordinates and synchronizes all HUMINT activities in the AOIR. The HOC exercises technical control over all HUMINT entities in the designated AOIR and deconflicts HUMINT activities with higher, lower, and adjacent HUMINT elements. The HOC accomplishes all responsibilities through coordination with the operational units and the CICA and operations support cell (OSC). The HOC tracks all HUMINT activities in the AOR. The J/G2X uses this information to advise the SIO on all HUMINT activities conducted within the AO. The HOC—

- Exercises technical control of all HUMINT assets and coordinates and deconflicts HUMINT activities in the deployed AO.
- Establishes and maintains a HUMINT source database.
- Coordinates and supervises HUMINT FP source operations conducted by all services and components in the AO.
- Develops and manages collection requirements for HUMINT in coordination with the requirements manager.
- Develops and provides the HUMINT portion of the intelligence synchronization plan to the J/G/S2X and requirements manager for inclusion in the intelligence synchronization plan.
- Coordinates the activities of HUMINT collectors assigned or attached to interrogations and debriefing facilities.
- Expedites preparation of intelligence information reports and their distribution to consumers at all levels.
- Performs liaison with HN and US national HUMINT organizations.

Operations Support Cell

6-52. The OSC in the *2X staff maintains the source registry for all HUMINT activities in the designated AOIR. The OSC provides management of intelligence property book operations, source incentive programs, and ICFs.

6-53. Integrating linguists and DOD emergency-essential civilians, such as technical support contractors, into the HUMINT team should take place as soon as possible. Security clearances and contractual agreements will help the team determine the level of integration.

6-54. Along with the basic briefing of what is expected of the civilian linguists as interpreters and the emergency-essential civilians as support personnel, HUMINT teams should be informed about the civilians' chain of command and the scope of their duties beyond interpreting and technical support. The HUMINT team leader must ensure that linguists and emergency-essential civilians are trained and capable of completing all tasks expected of them.

Counterintelligence Coordinating Authority

6-55. The CICA coordinates all CI activities for a deployed force. There can be only one CICA in a theater of operations. When multiple echelons exist, the highest echelon has the CICA and subordinate G2X offices have a CICA. Depending on the size and scope of the operation, the CICA could be the unified command's CI staff officer; the CI or HUMINT staff officer from corps or division; or a senior warrant officer or branch CI officer designated by the unified command CI staff officer or task force commander. For more information about the CICA functions, see Chapter 11.

HUMINT TEAM STRUCTURE

Operational Management Team

6-56. The OMT is a four-person team consisting of a warrant officer (WO), two noncommissioned officers (NCOs), and a junior enlisted soldier. Civilians may be inserted into this structure when appropriate. Rank structure and standards of grade for OMTs vary depending upon the skill sets required and mission focus. HUMINT OMTs provide operational guidance for two to four HUMINT teams, depending on mission focus and operational tempo. When two or more HUMINT teams are deployed in DS of a maneuver element, an OMT also deploys to provide technical control. The OMT works closely with the supported S2 and analysis and control team (ACT) to furnish current threat information and answer the supported commander's PIRs and IRs. OMTs coordinate with the supported 2X and manage subordinate HUMINT team echelons to—

- Provide guidance and technical control of operational activity.
- Provide the collection and operational focus for HUMINT teams.
- Provide quality control and dissemination of reports for subordinate HUMINT teams.
- Conduct single-discipline HUMINT analysis, and assist in mission analysis for the supported commander.

- Act as a conduit between subordinate HUMINT teams, the HOC, and supported unit headquarters.
- Provide administrative support for subordinate HUMINT teams, to include reporting mission and equipment status to the HOC and the supported unit headquarters.
- Educate the supported commander on the capabilities of the HUMINT teams.
- Integrate the HUMINT teams directly into the maneuver commander's ISR planning.

HUMINT Team

6-57. The HUMINT team is a four-person team consisting of two NCOs and two junior enlisted personnel. Civilians may be inserted into this structure when appropriate. Rank structure and standards of grade for HUMINT teams vary depending upon the skill sets required and the mission focus. HUMINT teams are trained to execute the full range of HUMINT functions as defined in **HUMINT FUNCTIONS** section. However, they may be assigned to mission-focused elements such as DOCEX, interrogation, debriefing, or contact operations.

Chapter 7

Imagery Intelligence

DEFINITION

7-1. IMINT is intelligence derived from the exploitation of imagery collected by visual photography, infrared, lasers, multi-spectral sensors, and radar. These sensors produce images of objects optically, electronically, or digitally on film, electronic display devices, or other media.

ROLE

7-2. The role of imagery is to assist the commander in focusing and protecting his combat power. Imagery often enhances the commander's situational understanding of the battlespace. Other than direct human observation, imagery is the only intelligence discipline that allows the commander to see the battlefield in real time as the operation progresses. In those cases where maps are not available, digital imagery in hardcopy or softcopy can be used as a substitute. Imagery can also be used to update maps or produce grid-referenced graphics. Detailed mission planning often requires imagery, to include three-dimensional stereo images, in order to provide the degree of resolution necessary to support such specialized planning.

FUNDAMENTALS

7-3. Some imagery assets are very responsive to the individual commander's intelligence requirements. Some imagery systems can directly transmit imagery into the tactical operations center (TOC); examples include imagery from UAVs and the Joint Surveillance Target Attack Radar System (JSTARS). This direct downlink enables the G2/S2 to use the imagery as soon as possible instead of having to wait for finished imagery products. A note of caution is required, however, if not a trained imagery analyst because the G2/S2 could incorrectly interpret the imagery.

7-4. Imagery-related equipment has undergone a reduction in size as well as a reduction in the time it takes to provide products, particularly softcopy imagery. The modularity and size reduction of imagery analysis, processing, and display systems make transport easier; they also allow the commander to bring lesser amounts than in the past, while still retaining those systems (or subsystems) required to complete the mission. Additionally, data compression allows faster transmission of imagery products directly to the warfighter.

SOURCES OF IMAGERY

7-5. There are three general sources of imagery: national, civil, and commercial. National imagery traditionally refers to imagery collected by DOD imagery systems. However, there are other sources of imagery provided

by non-national sources such as handheld photography (film, digital, and video), UAV imagery, and gun-camera images.

National

7-6. National systems are developed specifically for supporting the President of the United States, the Secretary of Defense, other national agencies, and US military forces. These systems respond to the needs of the nation and those of the combatant commands.

Civil

7-7. Civil imagery systems are usually government funded in terms of building, launching, and operating the system. In many, but not all, cases the agencies operating these civil imagery systems also process, distribute, and archive the imagery data or images.

Commercial

7-8. Commercial companies build, launch, and operate imagery systems for profit. In times of crises, license agreements with the US Government obligate US commercial satellite imaging systems to provide data only to the US Government at the market value. This protects information concerning US operations from adversarial exploitation from commercial systems such as the ACE Imagery Company. However, foreign commercial imagery systems are not bound to this arrangement, and thus may be used by our nation's adversaries. Commercial imagery has become increasingly valuable for many reasons:

- Due to its unclassified nature, civil and commercial imagery is useful in an open environment, may be released to multinational partners, and can be made available to the press. They are especially useful for geospatial products. Their use allows national systems more time to focus on other intelligence functions.
- Civil and commercial imagery offer radar and multi-spectral. Some offer large area collection useful for broad area coverage purposes.
- Commercial satellite imagery resolution varies from less than one meter to several kilometers.

7-9. The Central Imagery Tasking Office (CITO) is responsible for ordering commercial imagery. The Commercial Satellite Imagery Library is available to research DOD purchased commercial imagery. The G2/S2 should consult the CITO when forming commercial imagery requests. NGA will deliver the imagery primarily on CD-ROM media via courier or mail service. Limited digital or electronic delivery is available as well.

TYPES OF IMAGERY SENSORS

7-10. There are four types of imagery sensors: visible (optical), infrared, radar, and multi-spectral. Each sensor has a unique capability, with distinct advantages and disadvantages. The G2/S2 must understand each sensor's capability in order to select the best sensor for the mission and thus enable the user to better understand the intelligence received. Certain sensors are better suited for military operations than others. (See Table 7-1.)

Table 7-1. Sensor Characteristics Matrix.

SENSORS	ADVANTAGES	DISADVANTAGES
Visible (Optical) Best tool for daytime, clear weather, detailed analysis. Includes video and electro-optical.	• Affords a familiar view of a scene. • Offers system resolution that cannot be achieved in other optical systems or in thermal images and radars. • Preferred for detailed analysis and mensuration. • Offers stereoscopic viewing.	• Restricted by terrain and vegetation. • Limited to daytime use only. • Reduced picture size.
Infrared Best tool for nighttime, clear weather, detailed analysis. Includes Overhead Non-Imaging Infrared (ONIR).	• A passive sensor and is impossible to jam. • Offers camouflage penetration. • Provides good resolution. • Nighttime imaging capability.	• Not effective during thermal crossover periods. • Product not easily interpretable. • Requires skilled analysis. • Cannot penetrate clouds.
Radar Useful for detecting presence of objects at night and in bad weather. Includes synthetic aperture radar (SAR), coherent change detection (CCD), and MTI.	• All weather; can penetrate fog, haze, clouds, smoke. • Day or night use. • Does not rely on visible light nor thermal radiation. • Good standoff capability. • Large area coverage. • Allows moving target detection. • Foliage and ground penetration.	• Product not easily interpretable. • Requires skilled analysis. • Terrain masking inhibits use.
Multi-Spectral Imagery (MSI) Best tool for mapping purposes and terrain analysis.	• Large database available. • Band combinations can be manipulated to display desired requirements. • Images can be merged with other digital data to provide higher resolution.	• Product not easily interpretable. • Requires skilled analysis. • Computer manipulation requires large amounts of memory and storage; requires large processing capabilities.

PLAN

7-11. The first step in planning for IMINT is determining the need for IMINT products based on the PIRs and the initial IPB. The G2/S2 should research targets using online imagery databases early and request those imagery products that are not perishable for contingency planning. National and COCOM imagery databases may hold recently imaged targets that could meet the commander's immediate needs instead of requesting new imagery. The staff must clearly articulate their intelligence requirements to include communicating what the mission is and how the requested product will aid in mission accomplishment. The G2/S2 should submit the imagery requirement

using established procedures such as those in the unit's SOP or as established by the COCOM.

7-12. The G2/S2 must also determine the specific imagery requirements so as not to burden the system with unnecessary requests. The desire for imagery products often exceeds the capabilities of the IMINT system. Therefore, it is imperative that the G2/S2 consider what type of analysis they require, and request only that which they require. The specifications of the request for IMINT products often affect the timeliness of the response. For example, determining if vehicles are tanks takes less time and requires less resolution than determining if a tank is a T-64 or a T-72.

7-13. Here are some of the roles IMINT can perform that the G2/S2 may consider when determining IMINT requirements:

- Imagery can detect and/or identify and locate specific unit types, equipment, obstacles, potential field fortifications, etc., from which intelligence analysts are able to analyze enemy capabilities and develop possible COAs.
- Imagery can also update maps and enhance the interpretation of information from maps. Detailed mission planning uses imagery to include stereo images for three-dimensional viewing of the terrain and many other geospatial uses.
- Imagery can be used as a substitute for maps when maps are not available. The most common application of this technique is by constructing imagery mosaics: a combination of two or more overlapping photographic prints that form a single picture.
- MTI displays or products can provide an NRT picture of an entity's movement by indicating its speed, location, and direction of travel. MTI systems do not differentiate friendly from enemy. Imagery assets, particularly MTI systems, are useful in cueing other ISR systems.
- Imagery can be used to support protection of the force by helping the commander visualize how his forces look—including their disposition, composition, and vulnerabilities—as exploited by enemy IMINT systems.
- Imagery analysts use combat assessment imagery to confirm destruction, determine the percentage of destruction, or whether the target was unaffected.

PREPARE

7-14. The G2/S2 IMINT-related actions during the prepare function of the intelligence process include establishing or verifying the portion of the intelligence communications architecture that supports IMINT display and analysis functions properly. Additionally, the G2/S2 must ensure that required IMINT analytical assets and resources are prepared to provide support or are available through intelligence reach. Lastly, the G2/S2 must also ensure IMINT reporting and dissemination channels and procedures are in place and rehearsals are conducted with all pertinent IMINT elements to ensure interoperability.

COLLECT

7-15. As previously mentioned, there are four types of imagery sensors. Depending on the type of sensor, it can record hardcopy or softcopy single frame or continuous (video). A given imagery target will not necessarily receive continuous coverage due to the possible conflict between the number and priority of targets and the number and availability of imagery assets. However, a commander may decide to have continuous surveillance of certain targets, for specified periods of time, usually using his own imagery assets (for example, UAV) even though this detracts from the commander's ability to use these assets for other imagery targets within his AOI.

PROCESS

7-16. The process function regarding IMINT involves converting imagery data into a form that is suitable for performing analysis and producing intelligence. Examples of IMINT processing include developing film, enhancing imagery, converting electronic data into visual displays or graphics, and constructing electronic images from IMINT data.

PRODUCE

7-17. The IMINT producer must ensure the IMINT product satisfies the associated intelligence requirements and that the product is in the required format. The quality and resolution of the product is highly dependent upon the type of sensor, the time of day, and the weather conditions, as well as the imagery analyst's ability to identify items, vehicles, equipment, and personnel within the images. Specific IMINT products are discussed in the ANALYZE section below.

ANALYZE

7-18. Timeliness is critical not only to IMINT collection but also to IMINT analysis and reporting. It is difficult to separate IMINT reporting from IMINT analysis in this discussion. This is demonstrated by the three phases of IMINT reporting presented below; all are dependent upon the timeliness requirements. Each phase represents a different degree of analysis and period of time available to accomplish the exploitation of the imagery.

- First Phase imagery analysis is the rapid exploitation of newly acquired imagery and reporting of imagery-derived information within a specified time from receipt of imagery. This phase satisfies priority requirements of immediate need and/or identifies changes or activity of immediate significance. First Phase imagery analysis results in an Initial Phase Imagery Report (IPIR).
- Second Phase imagery analysis is the detailed exploitation of newly acquired imagery and the reporting of imagery-derived intelligence and information while meeting the production and timeliness requirements. Other intelligence discipline source material may support phase two imagery as appropriate. Second phase imagery analysis results in a Supplemental Imagery Report (SUPR).
- Third Phase imagery analysis is the detailed analysis of all available imagery pertinent to an SIR, and the subsequent production and reporting resulting from this analysis within a specified time. This

phase provides an organized detailed analysis of an imagery target or topic, using imagery as the primary data source but incorporating data from other sources as appropriate.

7-19. The two types of imagery exploitation are national and direct support (DS).

- National exploitation is imagery exploitation that supports presidential requirements, National Security Council (NSC) requirements, congressional requirements, or requirements of a common concern to the intelligence community.
- DS exploitation is imagery exploitation that supports assigned missions of a single agency, department, or command (the warfighter).

7-20. IMINT assets will complete DS exploitation in order to satisfy (First Phase) requirements and report the results as soon as possible, but not later than 24 hours after receipt of the imagery. Collectors will complete national exploitation in order to satisfy (Second and Third Phases) requirements and report the results within the time specifications of each individual requirement.

DISSEMINATE

7-21. IMINT products are distributed or disseminated in hardcopy, softcopy, or direct viewing such as through remote terminals. The distribution of hardcopy products will be via couriers or other type of mail system. The dissemination of softcopy products will be either as hardcopy products (for example, CD-ROM and 3.5-inch disks) or electronically. The requestor must ensure that the requested product is transmittable over the available communications systems.

ASSESS

7-22. The requestor should immediately assess the imagery product upon receipt for accuracy and relevance to the original request. The requestor must then notify the producer and inform him of the extent to which the product answered the PIR. Providing feedback to the producer regarding the product helps ensure the producer will provide the required information in the correct format. The following are some of the questions which the requestor should consider when providing feedback to the producer.

- Is the format of the product acceptable?
- Is additional information needed on the product or future products?
- Is excess information included on the product?

Chapter 8

Signals Intelligence

DEFINITION

8-1. SIGINT is a category of intelligence comprising either individually or in combination all COMINT, ELINT, and FISINT, however transmitted; intelligence is derived from communications, electronics, and foreign instrumentation signals. SIGINT has three subcategories:

- COMINT – The intelligence derived from foreign communications by other than the intended recipients.
- ELINT – The technical and geo-location intelligence derived from foreign non-communications electromagnetic radiations emanating from other than nuclear detonations or radioactive sources.
- FISINT – Technical information and intelligence derived from the intercept of foreign electromagnetic emissions associated with the testing and operational deployment of non-US aerospace, surface, and subsurface systems. Foreign instrumentation signals include but are not limited to telemetry, beaconry, electronic interrogators, and video data links. (See JP 1-02)

8-2. SIGINT provides intelligence to the commander based upon intercepted communications and provides transmitter location data.

ROLE

8-3. SIGINT provides intelligence on threat capabilities, disposition, composition, and intentions. In addition, SIGINT provides targeting information for the delivery of lethal and non-lethal effects.

FUNDAMENTALS

8-4. It is important that the G2/S2 understand how SIGINT assets are organized not only within the Army but also throughout the DOD. The majority of SIGINT assets are located at EAC. SIGINT assets from all the armed services, combined with national SIGINT assets, work together to support commanders from the tactical to the strategic level. Only by understanding the SIGINT structure that transcends traditional service component boundaries can the G2/S2 understand how to use SIGINT effectively.

TECHNICAL CONTROL AND ANALYSIS ELEMENT (TCAE) ARCHITECTURE

8-5. The TCAE architecture supports Army SIGINT collectors and analysts by providing SIGINT-specific intelligence and guidance to SIGINT personnel. The SIGINT technical architecture complements existing C2 relationships; it does not replace the commander's authority or chain of command.

8-6. There is a TCAE at each Army operational echelon. The TCAE at each echelon provides a single POC and resource dedicated to supporting the commander at that level. TCAEs or SIGINT elements at varying echelons draw information from each other in order to provide a more complete and detailed intelligence picture for their respective commanders.

ARMY TCAE (ATCAE)

8-7. The ATCAE, established at the national level, plays a significant role in TCAE operations by providing technical support oversight and providing access to national databases—in coordination with the NSA and other intelligence organizations. Additionally, the ATCAE works closely with NSA's IO element assisting in operations, monitoring technical capabilities, and providing liaison with Army's 1st Information Operations Command (Land). (This unit was previously called Land Information Warfare Activity.)

8-8. The ATCAE supports the Army's Quick Reaction Capability (QRC) SIGINT and signals research and target development (SRTD) operations. The QRC systems are responsive to the ground force commander's requirements and allow the ability to conduct SIGINT operations against modern communications systems.

REGIONAL TCAE (RTCAE)

8-9. The Army established RTCAEs to allow supported units at all echelons access to SIGINT regarding their respective AOI. The Army placed an RTCAE within each Regional Security Operations Center (RSOC). An RSOC is a joint service facility established by the Director, NSA, to conduct continuous security operations on selected targets in support of national and warfighter intelligence requirements using remoting technologies. The RSOC embeds a focus on the tactical commander's SIGINT requirements at a national level. It also creates a framework for enhanced interoperability among service SIGINT activities, especially within the context of a deployed JTF.

8-10. In addition to each RSOC, the RTCAE works closely with Theater TCAEs as well as Corps and Division SIGINT elements with the same regional focus. It provides analytic support and tailored products and answers RFIs. During peacetime and real-world operations RTCAEs facilitate intelligence reach support. They provide tailored technical support packages, support for surge and survey operations, analytic expertise, and signal data access and digital file transfers of live collection for Army tactical units.

THEATER TCAE

8-11. The Theater TCAE performs SIGINT and EW technical control and analysis and management. It provides SIGINT technical support for assigned, OPCON, and lower echelon SIGINT resources deployed in the theater. This includes mission tasking, processing, analyzing, and reporting of SIGINT data, information, and intelligence. The TCAE provides direction for the Theater Collection and Exploitation Battalion's SIGINT mission and for other theater tactical SIGINT assets.

SIGINT THEATER INTELLIGENCE BRIGADE/GROUP (TIB/TIG)

8-12. The TIB/TIG conducts operational level multidiscipline SIGINT operations. It provides timely intelligence to the commander throughout the full spectrum of operations. The TIB/TIG is structured to provide ground and aerial SIGINT support. It executes the full range of SIGINT missions or tasks.

SIGINT AT ECHELONS CORPS AND BELOW

8-13. There is a varying mixture of SIGINT assets within each corps. A reference listing the types of SIGINT assets found at echelons corps and below is listed in ST 2-50.

PLAN

8-14. An important SIGINT planning consideration is that if at all possible, SIGINT collection should be employed in conjunction with another intelligence discipline collection system. SIGINT is often used to cue, and be cued by, other ISR assets.

8-15. During planning, the G2/S2 should retrieve, update, or develop any required SIGINT databases. This includes effecting coordination with other SIGINT assets or elements that can support the operation.

8-16. SIGINT ground collection assets are usually placed in proximity to enemy signal sources due to the limited height of collector antennas, the low power output of threat or enemy emitters, and the line-of-sight (LOS) constraints imposed by terrain. Ground-based SIGINT teams are most effective when positioned to—

- Maximize threat emitter interception. This allows teams to overcome the constraints of threat emitter characteristics usually allowed by proximity to the threat.
- Minimize system receiver interference. This increases the potential capability of the team to acquire threat emitters in a timely manner.
- Optimize overlapping areas of intercept coverage. This ensures coverage of the AOIR and allows targets to be handed off from team to team if necessary.

8-17. Aerial SIGINT assets have additional planning requirements. Coordination must be effected with Army Airspace Command and Control (A2C2) for ingress and egress routes, restricted operating zones (ROZs) where the aircraft can travel on an intercept track, as well as with the supporting air operations center to determine the availability of asset types and times.

PREPARE

8-18. The G2/S2 ensures the SIGINT unit and asset leaders have effected all necessary coordination and conducted rehearsals. This includes establishing or verifying the operation of the SIGINT technical architecture. The G2/S2 also ensures all required SIGINT assets and resources are available, SIGINT reporting and dissemination channels and procedures are in place, and connectivity and interoperability exist with all pertinent SIGINT elements.

8-19. SIGINT OPCON is the authoritative direction of SIGINT activities, including tasking and allocation of effort, and the authoritative prescription

of those uniform techniques and standards by which SIGINT information is collected, processed, and reported.

8-20. SIGINT operational tasking is the authoritative operational direction of and direct levying of SIGINT information needs by a military commander on designated SIGINT resources. These requirements are directive, regardless of other priorities, and are conditioned only by the capability of those resources to produce such information. Operational tasking includes authority to deploy all or part of the SIGINT resources for which SIGINT operational tasking authority (SOTA) has been delegated.

8-21. SOTA is the military commander's authority to operationally direct and levy SIGINT requirements on designated SIGINT resources; it includes authority to deploy and redeploy all or part of the SIGINT resources for which SOTA has been delegated.

COLLECT

8-22. SIGINT performs two major collection activities: signals intercept and direction finding (DF).

Signals Intercept

8-23. Signals intercept are those SIGINT actions used to search for, intercept, and identify threat electromagnetic signals for the purpose of immediate threat recognition. Signals intercept provides information required to answer PIRs, and other intelligence requirements in support of the ISR effort.

Direction Finding

8-24. Even when threat radio operators use COMSEC procedures, SIGINT teams can often intercept and approximate the location of the threat's signals. Specifically, SIGINT teams can use DF to determine—

- Movement of threat personnel or equipment.
- Locations of emitters associated with weapon systems and units.
- New emitter locations and confirm known emitter locations.
- Possible friendly targets the enemy intends to attack (lethal and non-lethal).

8-25. In addition to finding threat forces, DF operations can assist the (radio-equipped) friendly force by—

- Locating and vectoring assets or units during limited visibility.
- Locating downed aircraft and personnel radio beacons.
- Conducting signal security assessments.
- Locating sources of communication interference and jamming.

PROCESS

8-26. SIGINT processing involves converting intercepts of SIGINT into written and verbal reports, automated message, graphic displays, recordings, and other forms suitable for analysis and intelligence production. Since US forces routinely conduct operations against adversaries who speak languages other than English, SIGINT processing often also includes translation of these intercepts.

8-27. Due to the complexity of many SIGINT systems, automated processing may occur several times before SIGINT data or information receives any human interaction.

PRODUCE

8-28. The SIGINT producer must ensure the SIGINT product satisfies the associated intelligence requirements and that the product is in the required format. The quality, fidelity, and timeliness of SIGINT products are highly dependent upon the type of intercept, the collection system, the system's position in relation to the threat emitter, the weather (including space-based weather), as well as the SIGINT operator's ability to identify the appropriate threat signal activity.

8-29. SIGINT production results in some of the reports and formats mentioned in the process section above; however, the objective for SIGINT is to be used in an all-source analytical approach.

ANALYZE

8-30. The intelligence staff analyzes intelligence and information about the enemy's communications capabilities to determine appropriate SIGINT collection strategies. Conversely, a corresponding analysis of the friendly forces' SIGINT capabilities must be conducted to ensure the continued effectiveness of, or to improve upon, SIGINT collection.

8-31. SIGINT analysts also sort through large amounts of SIGINT and information and intelligence to identify and use only that which is pertinent to the CCIRs (PIRs and FFIRs).

DISSEMINATE

8-32. SIGINT of critical importance to the force, including answers to the CCIRs (PIRs and FFIRs), is disseminated via the most expeditious means possible. Due to the usually highly perishable nature of SIGINT, the most expeditious reporting means is often immediately augmented with a follow-up report or augmented by a report transmitted through additional means, enhancing the probability of receipt. Sometimes the most expeditious means of reporting critical SIGINT information to the commander is face to face.

8-33. For intelligence reach operations, SIGINT products are available and disseminated in a variety of forms: hardcopy, softcopy, direct viewing, or listening (television or radio). It is incumbent on the requestor to ensure that the SIGINT product can be transmitted over the available communications systems. This includes verifying the appropriate security level of the communications system.

ASSESS

8-34. The primary goal of the assess function when applied to SIGINT is to determine whether the results of SIGINT collection meet the requirements of the unit's ISR effort. SIGINT producers must assess all facets of SIGINT operations, from receipt of the ISR task to the dissemination of SIGINT, in an effort to determine their effectiveness. This assessment is not only directed at each SIGINT asset individually but also throughout the supporting SIGINT architecture and the unit's entire ISR effort.

8-35. The G2/S2 immediately assesses SIGINT products upon receipt for accuracy and relevance. He must inform the SIGINT producer of the extent to which the product answered the PIR or intelligence requirement. Providing feedback to the SIGINT producer—and collector—helps improve the effectiveness and efficiency of SIGINT.

Chapter 9

Measurement and Signatures Intelligence

DEFINITION

9-1. MASINT is technically derived intelligence that detects, locates, tracks, identifies, and/or describes the specific characteristics of fixed and dynamic target objects and sources. It also includes the additional advanced processing and exploitation of data derived from IMINT and SIGINT collection.

9-2. MASINT collection systems include but are not limited to radar, spectroradiometric, E-O, acoustic, RF, nuclear detection, and seismic sensors, as well as techniques for gathering NBC and other material samples.

9-3. It requires the translation of technical data into recognizable and useful target features and performance characteristics. Computer, communication, data, and display processing technologies now provide MASINT in support of commanders throughout the full spectrum of operations.

9-4. The subdisciplines within MASINT include, but are not limited to, the following:

- **Radar Intelligence (RADINT).** The active or passive collection of energy reflected from a target or object by LOS, bistatic, or over-the-horizon radar systems. RADINT collection provides information on radar cross-sections, tracking, precise spatial measurements of components, motion and radar reflectance, and absorption characteristics for dynamic targets and objectives. A SAR system, coupled with advanced MASINT processing techniques—
  - Provides a high resolution, day and night collection capability.
  - Can produce a variety of intelligence products that identify or provide change detection, terrain mapping, underwater obstacles, dynamic sensing of targets in clutter, and radar cross-section signature measurements.
- **Frequency Intelligence.** The collection, processing, and exploitation of electromagnetic emissions from a radio frequency weapon (RFW), an RFW precursor, or an RFW simulator; collateral signals from other weapons, weapon precursors, or weapon simulators (for example, electromagnetic pulse signals associated with nuclear bursts); and spurious or unintentional signals.
  - *Electromagnetic Pulses*. Measurable bursts of energy that result from a rapid change in a material or medium, resulting in an explosive force, produces RF emissions. The RF pulse emissions associated with nuclear testing, advanced technology devices, power and propulsion systems, or other impulsive events can be used to detect, locate, identify, characterize, and target threats.

- *Unintentional Radiation Intelligence (RINT).* The integration and specialized application of MASINT techniques against unintentional radiation sources that are incidental to the RF propagation and operating characteristics of military and civil engines, power sources, weapons systems, electronic systems, machinery, equipment, or instruments. These techniques may be valuable in detecting, tracking, and monitoring a variety of activities of interest.

- **E-O Intelligence.** The collection, processing, exploitation, and analysis of emitted or reflected energy across the optical portion (ultraviolet, visible, and infrared) of the EMS. MASINT E-O provides detailed information on the radiant intensities, dynamic motion, spectral and spatial characteristics, and the materials composition of a target. E-O data collection has broad application to a variety of military, civil, economic, and environmental targets. E-O sensor devices include radiometers, spectrometers, non-literal imaging systems, lasers, or laser radar (LIDAR).
  - *Infrared Intelligence (IRINT).* A subcategory of E-O that includes data collection across the infrared portion of the EMS where spectral and thermal properties are measured.
  - *LASER Intelligence (LASINT).* Integration and specialized application of MASINT E-O and other collection to gather data on laser systems. The focus of the collection is on laser detection, laser threat warning, and precise measurement of the frequencies, power levels, wave propagation, determination of power source, and other technical and operating characteristics associated with laser systems—strategic and tactical weapons, range finders, and illuminators.
  - *Hyperspectral Imagery (HSI).* A subcategory of E-O intelligence produced from reflected or emitted energy in the visible and near infrared spectrum used to improve target detection, discrimination, and recognition. HSI can detect specific types of foliage—supporting drug-crop identification; disturbed soil—supporting the identification of mass graves, minefields, caches, underground facilities or cut foliage; and variances in soil, foliage, and hydrologic features—often supporting NBC contaminant detection.

- **Spectroradiometric Products.** Include E-O spectral (frequency) and radiometric (energy) measurements. A spectral plot represents radiant intensity versus wavelength at an instant in time. The number of spectral bands in a sensor system determines the amount of detail that can be obtained about the source of the object being viewed. Sensor systems range from multispectral (2 to 100 bands) to hyperspectral (100 to 1,000 bands) to ultraspectral (1,000+ bands). More bands provide more discrete information, or greater resolution. The characteristic emission and absorption spectra serve to fingerprint or define the makeup of the feature that was observed. A radiometric plot represents the radiant intensity versus time. An example is the radiant intensity plot of a missile exhaust plume as the missile is in flight. The intensity or brightness of the object is a function of several conditions including its temperature, surface properties or material, and how fast it is moving. For each point along a time-intensity

radiometric plot, a spectral plot can be generated based on the number of spectral bands in the collector.

- **Geophysical Intelligence.** Geophysical MASINT involves phenomena transmitted through the earth (ground, water, atmosphere) and manmade structures including emitted or reflected sounds, pressure waves, vibrations, and magnetic field or ionosphere disturbances.
  - *Seismic Intelligence*. The passive collection and measurement of seismic waves or vibrations in the earth surface.
  - *Acoustic Intelligence*. The collection of passive or active emitted or reflected sounds, pressure waves or vibrations in the atmosphere (ACOUSTINT) or in the water (ACINT). ACINT systems detect, identify, and track ships and submarines operating in the ocean.
  - *Magnetic Intelligence*. The collection of detectable magnetic field anomalies in the earth's magnetic field (land and sea). An example is a Remotely Emplaced Battlefield Surveillance System (REMBASS) sensor detection indicating the presence and direction of travel of a ferrous object.
- **Nuclear Intelligence (NUCINT).** The information derived from nuclear radiation and other physical phenomena associated with nuclear weapons, reactors, processes, materials, devices, and facilities. Nuclear monitoring can be done remotely or during onsite inspections of nuclear facilities. Data exploitation results in characterization of nuclear weapons, reactors, and materials. A number of systems detect and monitor the world for nuclear explosions, as well as nuclear materials production.
- **Materials Intelligence.** The collection, processing, and analysis of gas, liquid, or solid samples. Materials intelligence is critical to collection against NBC warfare threats. It is also important to analyzing military and civil manufacturing activities, public health concerns, and environmental problems. Samples are both collected by automatic equipment, such as air samplers, and directly by humans. Samples, once collected, may be rapidly characterized or undergo extensive forensic laboratory analysis to determine the identity and characteristics of the sources of the samples.

ROLE

9-5. MASINT provides intelligence to the commander throughout the full spectrum of operations to facilitate situational understanding. MASINT can thwart many of the camouflage, concealment, and deception techniques currently used to deceive ISR systems.

9-6. MASINT is perceived as a "strategic" discipline with limited "tactical" support capabilities. But, by application of real-time analysis and dissemination, MASINT has a potential ability to provide real-time situation awareness and targeting not necessarily available to the classic disciplines. Specifically, MASINT "sensors" have unique capabilities to detect missile launch, detect and track aircraft, ships, and vehicles; do non-cooperative target identification (NCTI), combat assessment, and BDA; and detect and track fallout from nuclear detonations. Often, these contributions are the first indicators of hostile activities. For example, two EXOCET-equipped

Mirage F-1s were shot down during the Operation DESERT STORM due to MASINT collection and analysis. As evidenced by Operation IRAQI FREEDOM (OIF), MASINT will play a decisive role in the targeting of smart munitions with the signatures (fingerprint) of the targets they are seeking (for example, infrared signatures).

9-7. The MASINT systems most familiar on today's battlefield are employed by ground surveillance and NBC reconnaissance elements.

9-8. MASINT spans the entire EMS and its capabilities complement, rather than compete with, the other intelligence disciplines. MASINT provides, to varying degrees, the capability to—

- Use automatic target recognition (ATR) and aided target recognition (AiTR).
- Penetrate manmade and/or natural camouflage.
- Penetrate manmade and/or natural cover, including the ability to detect subterranean anomalies or targets.
- Counter stealth technology.
- Detect recently placed mines.
- Detect natural or manmade environmental disturbances in the earth's surface not discernible through other intelligence means.
- Provide signatures (target identification) to munitions and sensors.
- Enhance passive identification of friend or foe.
- Detect the presence of NBC agents to include prior to, during, or after employment.
- Detect signature anomalies that may affect target-sensing systems.

FUNDAMENTALS

9-9. Before discussing the functions of the intelligence process within a MASINT, the following paragraph provides an overview of organizational structure of MASINT.

9-10. Within DOD, the DIA provides central coordination for MASINT collection efforts through the Central MASINT Office. Each service, in turn, has a primary command or staff activity to develop requirements and coordinate MASINT effort. Army responsibility currently resides with INSCOM. Army weapons systems programs that require MASINT information to support system design or operations submit requests through the Army Reprogramming Analysis Team (ARAT) or INSCOM channels for data collection and processing. The S&TI community also performs MASINT collection and processing primarily to support R&D programs and signature development. Every S&TI center has some involvement in MASINT collection or production that reflects that center's overall mission (for example, NGIC does work on armored vehicles and artillery). Service R&D centers such as the Communications-Electronics Command (CECOM) Research, Development, and Engineering Center (RDEC), and Night Vision and Electronic Systems Laboratory are also involved in developing sensor systems for collecting and processing MASINT.

9-11. In addition to supporting the S&TI mission, INSCOM units also execute limited ground-based operational collection to support Theater and ASCC PIRs. This capability will expand upon the standup of INSCOM TIBs and TIGs.

PLAN

9-12. Some MASINT sensors can provide extremely specific information about detected targets, whereas other sensors may only be capable of providing an indication that an entity was detected. Additionally, there are varying capabilities of detection, identification, and classification among MASINT sensors. It is these varying capabilities that require synchronizing the employment of MASINT sensors both within the MASINT discipline and within the ISR effort as a whole. See FM 2-01 for more specific information on ISR synchronization.

9-13. As previously mentioned, there are many types of MASINT sensors. Depending on the type of sensor employed, a given MASINT collection target or NAI may not necessarily receive continuous coverage due to the possible conflict between the number and priority of targets and the number and availability of MASINT assets. However, a commander may decide to have continuous surveillance of certain targets by using his own MASINT assets (for example, REMBASS or Improved-REMBASS).

9-14. Another consideration when planning MASINT missions is whether to use active, passive, or a combination of both when planning MASINT coverage.

PREPARE

9-15. The G2/S2 MASINT related actions during the prepare function of the intelligence process include properly establishing or verifying the MASINT portion of the intelligence communications architecture functions. Additionally, the G2/S2 must ensure that required MASINT analytical assets and resources are prepared to provide support or are available through intelligence reach. Since the products of MASINT are not as well known as products from other intelligence disciplines, the G2/S2 must be aware of the types of MASINT products available to support the operation, and then educate the rest of his unit's staff on the use of these MASINT products. Lastly, the G2/S2 must also ensure MASINT reporting and dissemination channels and procedures are in place and rehearsals are conducted with all pertinent MASINT elements to ensure interoperability.

COLLECT

9-16. MASINT provides information required to answer PIRs and other intelligence requirements in support of the ISR effort. As stated earlier in this chapter, MASINT collection must not only be synchronized within its own discipline but also be synchronized and integrated into the unit's overall ISR effort in order to be effective.

9-17. MASINT sensors are employed throughout the full spectrum of operations from a variety of platforms—sub-surface, ground, marine, and aerospace.

PROCESS

9-18. Just as in the other intelligence disciplines, MASINT involves dealing with huge volumes of data that have to be processed before beginning analysis and production. The process function regarding MASINT involves converting esoteric data into a form that is suitable for performing analysis and producing intelligence. MASINT processing can include relatively simple actions such as converting a REMBASS sensor activation into a report, to a complex task such as processing HSI into a report identifying the composition and concentrations of carcinogenic chemicals present in the emissions from a factory upwind from a US forces encampment.

PRODUCE

9-19. Effective and timely MASINT requires personnel with diverse skill sets. The MASINT producer must ensure the MASINT product satisfies the associated intelligence requirements and that the product is in the required format. The quality, fidelity, and timeliness of MASINT products are highly dependent upon the type of target, the collection system, the system's position in relation to the target or NAI, and the weather, as well as the MASINT system operator's ability to identify the appropriate threat activity.

9-20. The objective of MASINT production is to be used in an all-source analytical approach.

ANALYZE

9-21. The intelligence staff analyzes intelligence and information about the enemy's equipment, doctrine, and TTP to determine appropriate MASINT collection strategies. Conversely, a corresponding analysis of the friendly force's MASINT capabilities must be conducted to ensure the continued effectiveness of, or to improve upon, MASINT collection.

DISSEMINATE

9-22. MASINT of critical importance to the force, including answers to the PIRs, is disseminated via the most expeditious means possible.

9-23. For intelligence reach operations, MASINT products are available and disseminated in a variety of forms. The requestor must ensure that the MASINT product can be transmitted over the available communications systems. This includes verifying the appropriate security level of the communications system.

ASSESS

9-24. The primary goal of the MASINT assess function is to determine whether the results of MASINT collection and production meet the requirements of the unit's ISR effort. MASINT producers must assess all facets of MASINT operations, from receipt of the ISR task to the dissemination of MASINT, in an effort to determine the effectiveness of MASINT. This assessment is not only directed at each MASINT asset individually but also throughout the supporting intelligence communications architecture, to include intelligence reach and the unit's entire ISR effort.

9-25. Also, the G2/S2 immediately assesses MASINT products upon receipt for accuracy and relevance. He must inform the MASINT producer of the extent to which the product answered the PIR or intelligence requirement. Providing feedback to the MASINT producer—and collector—helps improve the effectiveness and efficiency of MASINT.

Chapter 10

Technical Intelligence

DEFINITION

10-1. TECHINT is intelligence derived from the collection and analysis of threat and foreign military equipment and associated materiel.

ROLE

10-2. The strength of the US military lies, in part, to the diversity and extent of its technology base. While the US aspires to be the leader in integrating technology, the threat can achieve temporary technological advantage in certain areas by acquiring modern systems or capabilities. The world arms market is willing to provide these advanced systems to countries or individuals with the resources to pay for them. A concerted TECHINT program is vital to providing precise direction and purpose within the US R&D process to ensure quick and efficient neutralization of this advantage.

10-3. The role of TECHINT is to ensure that the warfighter understands the full technological capabilities of the threat. With this understanding, the warfighter can adopt appropriate countermeasures, operations, and tactics.

10-4. TECHINT has two goals within its role:

- To ensure the US armed forces maintain technological advantage against any adversary.
- To provide tailored, timely, and accurate TECHINT support to the warfighter throughout the entire range of military operations. This includes providing US forces intelligence, information, and training on foreign weapons systems to an extent that allows their use of CEE.

FUNDAMENTALS

10-5. The G2/S2 must understand how TECHINT assets are organized in order to properly apply the intelligence process, as the majority of TECHINT assets are located at EAC.

DEFENSE INTELLIGENCE AGENCY

10-6. DIA manages and reviews overall TECHINT activities. The S&TI Directorate within DIA is the action element for TECHINT. This directorate coordinates with external TECHINT agencies on non-policy matters concerning the production of S&TI. The following organizations provide TECHINT support under the control of DIA:

- **Armed Forces Medical Intelligence Center (AFMIC).** AFMIC, based at Fort Detrick, MD, is a DOD intelligence production center under DIA control. AFMIC is responsible for exploiting foreign medical materiel. The director supports the Army Foreign Materiel Exploi-tation

Program (FMEP) and Army medical R&D requirements. The director coordinates planning, programming, and budgeting with the Army Deputy Chief of Staff, Intelligence (DCS, G2).

- **Missile and Space Intelligence Center (MSIC).** MSIC, based at Redstone Arsenal, AL, is a DOD intelligence production center under DIA control and supports the FMEP. The MSIC acquires, produces, maintains, and disseminates S&TI pertaining to missile and space weapons systems, subsystems, components, and activities. The S&TI produced at MSIC also covers foreign state-of-the-art technology and research applicable to missiles.
- **Defense HUMINT Service.** DHS conducts worldwide HUMINT operations in support of foreign materiel acquisition (FMA) and foreign materiel exploitation (FME).

10-7. The organizations and agencies discussed below constitute the Army TECHINT structure.

ARMY DCS, G2

10-8. The Army DCS, G2 exercises general staff responsibility for all Army TECHINT activities. The Army DCS, G2 forms policies and procedures for S&TI activities, supervises and carries out the Army S&TI program, coordinates DA staff and MSC requirements for TECHINT, and is responsible for the Army Foreign Materiel Program (FMP).

INSCOM

10-9. Under the direction of Headquarters, Department of the Army (HQDA), INSCOM is responsible for peacetime TECHINT operations. HQ, INSCOM, fulfills its responsibilities through its TECHINT oversight function and manages the Army's Foreign Materiel for Training (FMT) Program and FMEP. It provides the interface with strategic S&TI agencies in support of FME and organizes, trains, and equips EAC TECHINT organizations during peacetime. TECHINT exploitation within INSCOM is performed by the following elements:

- **National Ground Intelligence Center.** HQ, INSCOM, exercises direct OPCON over the NGIC. NGIC produces and maintains intelligence on foreign scientific developments, ground force weapons systems, and associated technologies. NGIC analysis includes but is not limited to military communications electronics systems, types of aircraft used by foreign ground forces, NBC systems, and basic research in civilian technologies with possible military applications.
- **203d Military Intelligence Battalion.** The 203d MI Battalion is a multicomponent unit headquartered at Aberdeen Proving Ground, MD, and is the Army's sole TECHINT battalion. It performs the following functions:
  - Conducts TECHINT collection and reporting in support of validated S&TI objectives.
  - Acts as the HQDA executive agent for foreign materiel used for training purposes.

- Conducts TECHINT training for DOD analysts and RC TECHINT personnel.
- Supports INSCOM's FMA and FME operations as directed.
- Analyzes and exploits foreign captured enemy documents (CEDs), equipment, weapon systems, and other war materiel.
- Reports on the capabilities and limitations of enemy combat materiel.
- Provides reports alerting the command to the tactical threat posed by technical advances in new or recently discovered foreign or enemy materiel.
- Provides countermeasures to any enemy technical advantage.
- Provides foreign or enemy equipment for troop familiarization and training.
- Provides recommendations on the reuse of CEM.
- Supervises evacuating items of TECHINT interest.
- Provides task-organized battlefield TECHINT teams to support a subordinate command's TECHINT effort.

US ARMY MATERIEL COMMAND (AMC)

10-10. AMC plays a significant support role in TECHINT. Among AMC elements are a series of RDECs, the Army Research Laboratory System, and the Test and Evaluation Command (TECOM). Each conducts highly technical evaluations of foreign equipment. In peacetime, the AMC conducts FME on equipment purchased by each laboratory and RDEC for the intelligence community and for DOD as part of the International Materiel Evaluation Program (IMEP). AMC elements include—

- The Foreign Ordnance Exploitation Team, which is located at the Fire Support Armaments Center (FSAC) in the Picatinny Arsenal. This team exploits foreign ground ordnance and develops render safe procedures (RSPs) for foreign ordnance. It also prepares detailed intelligence reports to support explosive ordnance disposal (EOD), MI, and US munitions developers.
- The Science and Technology Center Europe and the Science and Technology Center Far East, which have the responsibility of collecting information on foreign technical developments by attending arms shows and technology exhibitions.
- The Soldier Biological Chemical Defense Command, which is the headquarters for the US Army Technical Escort Unit (TEU). The mission of the TEU is to collect and escort (transport) chemical, biological, radiological, and nuclear (CBRN) samples for testing and evaluation.

10-11. There are many other agencies with TECHINT responsibilities within the DOD. Refer to FM 34-54 for more information on TECHINT.

PLAN

10-12. TECHINT collection usually begins when an organization or individual reports the recovery or acquisition of unusual, new, or newly

employed threat materiel. However, there are often indications that the threat may be using materiel not yet associated with the threat among the myriad intelligence products available. Conversely, it may be known that the threat is using a particular item, the capabilities of which are unknown to US forces. It is in these cases that a unit may receive a TECHINT related ISR task. It is conceivable that such a task may be reflected in the PIR. An example of such a task is the identification or verification of suspected external modifications on a particular model of an enemy's main battle tank; the results of which are linked to a commander's decision.

10-13. TECHINT related ISR tasks should include a mission or target folder. At a minimum, this folder should include a description of the item, with its associated major combat systems, as well as handling instructions, reporting instructions, and a photograph or sketch of the item if available.

10-14. Additionally, the G2/S2 is responsible for ensuring the staff coordinates and establishes a plan for evacuating the desired materiel.

PREPARE

10-15. The G2/S2 must ensure that required TECHINT analytical assets, resources, and evacuation means are prepared to provide support. This includes verifying coordination effected with the task-organized battlefield TECHINT teams from the 203d MI Battalion. The G2/S2 must also ensure the means to report and disseminate TECHINT results to the unit and its soldiers are in place so that they can immediately adopt appropriate countermeasures, operations, or tactics in order to enhance their survival and mission accomplishment.

COLLECT

10-16. TECHINT collection includes capturing, reporting, and evacuating CEM. TECHINT collection begins when an organization or individual reports the recovery or acquisition of threat materiel. An item of materiel is exploited at each level, and continues on through succeeding higher levels until an appropriate countermeasure to neutralize the item's capabilities is identified or developed.

10-17. Army personnel (soldiers and civilian) and units will normally safeguard CEM and report it through intelligence channels to the first TECHINT element in the reporting chain. The location of this TECHINT element will be in accordance with the METT-TC factors; however, there will usually be TECHINT representation at the Corps G2 or the COCOM J2. The TECHINT representative or element will verify if the type of materiel is of intelligence value and determine its further disposition in conjunction with the unit's staff.

PROCESS

10-18. TECHINT processing starts (simultaneously with collection) with the capture of a piece of equipment of TECHINT value. This confirms that the enemy is indeed employing this materiel. In accordance with METT-TC factors, a TECHINT team may move to the location of the item at the capture site or wait until the item is evacuated before conducting a hasty exploitation. After hasty exploitation, the team decides if further processing

is required. If it is, the items are sent to the first (or nearest) Captured Materiel Exploitation Center (CMEC). If the item is deemed to yield no immediate tactical intelligence value, it may still be evacuated to the S&TI centers in CONUS for further analysis if the systems represent a change in the technological posture of an enemy.

PRODUCE

10-19. Battlefield TECHINT teams normally report initial and secondary examinations of CEM using either a preliminary technical report or a complementary technical report.

- A preliminary technical report—
  - Includes a general description of the item reported and recommended RSP.
  - Alerts others to information that can be used immediately by tactical units.
- A complementary technical report is more in-depth and—
  - Follows a secondary or an in-depth initial examination.
  - Allows the CMEC to compare new information with intelligence holdings.

10-20. At each successive echelon of exploitation, TECHINT analysts add to the overall body of information on an item by either adding to previous reports or by preparing new reports. The CMEC or other national level S&TI activities prepare more advanced technical reports and analyses. These reports include—

- Detailed technical reports.
- Translation reports.
- Special technical reports.

10-21. Other TECHINT products include—

- CMEC publications such as operator manuals, maintenance manuals, TECHINT bulletins, and tactical user bulletins.
- S&TI analysis bulletins.
- Foreign materiel exploitation reports.

ANALYZE

10-22. TECHINT analysts use checklists established by S&TI agencies and the CMECs to analyze each type of the adversary's equipment for which requirements exist. Analysis always begins with what is, and what is not, known about the piece of equipment. TECHINT units maintain procedures and plans for sampling, analyzing, and handling materiel.

DISSEMINATE

10-23. TECHINT of critical importance to the force, including answers to the PIR, is disseminated via the most expeditious means possible.

10-24. Routine TECHINT reports and products are usually transmitted through the unit's existing intelligence communications architecture in the format of an intelligence information report (IIR) format. For intelligence

reach operations, TECHINT products are available and disseminated in a variety of forms. The requestor must ensure that the TECHINT product can be transmitted over the available communications systems. This includes verifying the appropriate security level of the communications systems.

ASSESS

10-25. The primary goal of the TECHINT assess function is to determine whether the results of TECHINT production meet the unit's PIR or intelligence requirements. The G2/S2 immediately assesses TECHINT products upon receipt for accuracy and relevance. He must inform the TECHINT producer of the extent to which the product answered the PIR or intelligence requirement. Providing feedback to TECHINT analysts helps improve the effectiveness and efficiency of TECHINT.

10-26. The G2/S2 also assesses the success of the unit's ISR effort in accomplishing any TECHINT associated ISR task and shares his assessment with the staff and the pertinent units or personnel.

Chapter 11

Counterintelligence

DEFINITION

11-1. CI counters or neutralizes intelligence collection efforts through collection, CI investigations, operations, analysis and production, and functional and technical services. CI includes all actions taken to detect, identify, exploit, and neutralize the multidiscipline intelligence activities of friends, competitors, opponents, adversaries, and enemies. It is the key intelligence community contributor to protect US interests and equities. Figure 11-1 shows the CI overview.

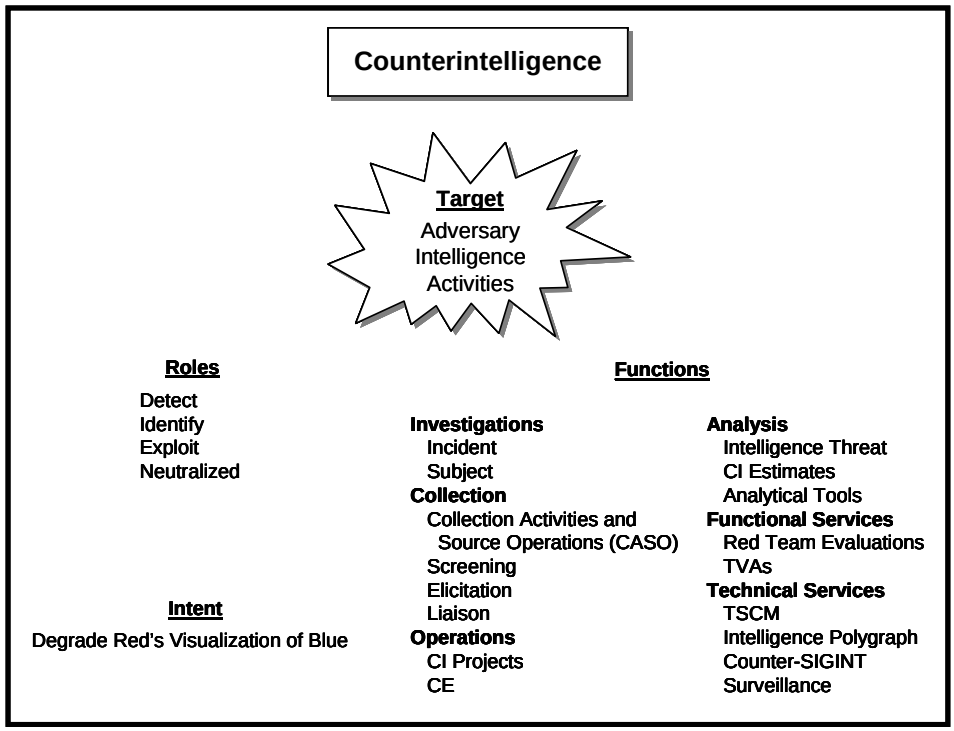

Figure 11-1. Counterintelligence Overview.

ROLE

11-2. The role of CI is to detect, identify, exploit, and neutralize all adversary intelligence entities targeting US and multinational interests. CI will focus on countering adversary intelligence collection activities targeting information or material concerning US personnel, activities, operations, plans, equipment, facilities, publications, technology, or documents—either classified or unclassified—without official consent of designated US release

authorities, for any purpose that could cause damage or otherwise adversely impact the interests of national security of the US ability to fulfill national policy and objectives. Adversary intelligence threats include but are not limited to any (US, multinational, friendly, competitor, opponent, adversary, or recognized enemy) government or NGOs, companies, businesses, corporations, consortiums, groups, agencies, cells or persons, terrorists, insurgents, guerrilla entities, and persons whose demonstrated actions, views, or opinions are inimical to US interests.

11-3. CI elements are instrumental in contributing to situational awareness in the AOI. CI elements may corroborate other intelligence discipline information as well as cue other intelligence assets through the CI core competencies and through CI technical services. The CI core competencies are collection, investigations of national security crimes within the purview of CI, operations, and analysis and production. CI technical services include computer network operations, technical surveillance countermeasures (TSCM), and polygraph. CI focuses on combating adversary intelligence activities targeting Army personnel, plans, operations, activities, technologies, and other critical information and infrastructure.

COUNTERINTELLIGENCE FUNCTIONS

11-4. CI functions are interrelated, mutually supporting, and can be derived from one another. No single function or technical capability can defeat adversary intelligence efforts to target US interests. CI functions are discussed below.

CI INVESTIGATIONS

11-5. Investigative activity is essential to countering the adversary intelligence threat to Army interests. CI places emphasis on investigative activity to support force, infrastructure and technology protection, homeland defense, information assurance, and security programs. CI investigations focus on resolving allegations of known or suspected acts that may constitute National Security Crimes under US law. The primary objective in any CI investigation is the detection, identification, exploitation, and/or neutralization of adversary intelligence threats directed against the US Army. CI investigations are also conducted to identify systemic security problems that may have damaging repercussions to Army operations and national security interests. All CI investigations are conducted within guidelines established in AR 381-10, AR 381-12, AR 381-20, applicable DOD policy and directives, and US laws.

CI OPERATIONS

11-6. CI operations are characterized as those activities that are not solely associated with investigative, collection, analysis, or production functions. CI operations can be either offensive or defensive in nature; they are derived from or transition to a collection or investigative activity depending on the scope, objective, or continued possibility for operational exploitation. CI operations fall into two categories: CI support operations and CI sensitive operations.

- **CI Support Operations**. These are defensive operations used to support ARFOR and technology protection, security projects, and programs. They include technical services support, support to acquisition, FP, special access, international security, foreign visitor or contact, treaty verification, information assurance, homeland defense, and other approved projects and programs.
- **CI Sensitive Operations**. These operations are generally offensive in nature and involve direct or indirect operations against a known adversary intelligence threat. These operations include counter-espionage (CE) and CI projects and are conducted by designated units.

CI COLLECTION

11-7. **Collection Activities**. CI elements conduct collection activities focused on adversary intelligence threats that target US and multinational interests. CI collection is conducted through the use of sources, assets, official contacts, and other human or multimedia sources to obtain information that impacts the supported unit. CI will not be used as a substitute for Army HUMINT collection. These activities are designed to collect specific information or develop leads concerning adversary intelligence collection requirements, capabilities, efforts, operations, structure, personalities, and methods of operation targeting US and multinational interests. CI collection can result from ongoing CI investigations or operations or serve to initiate CI investigations and/or operations.

11-8. **Liaison**. CI elements conduct liaison with US, multinational, and HN military and civilian agencies, to include NGO, for the purpose of obtaining information of CI interest and coordinating or deconflicting CI activities. Liaison activities are designed to ensure a cooperative operating environment for CI elements and to develop CI leads for further exploitation.

11-9. **CI Collection Activities and Source Operations (CASO)**. CASO is used to collect information on direct threats to US Army installations, organizations, activities, and personnel. The CASO program is not intended to be used as a substitute for tactical HUMINT contact operations. CASO can be used to initiate CI investigations, identify potential leads for offensive operations, or develop additional CASO leads. **Only designated units, in accordance with applicable policy, will be authorized to pursue investigative and offensive operational leads from ongoing CASO operations.**

11-10. **Screening**. CI Special Agents work jointly with HUMINT Collectors during screening operations to identify civilians on the battlefield, EPWs, detainees, and other noncombatants who may have information of CI interest or to develop CI leads. CI screening is also conducted during the process of hiring HN citizens for Army and DOD employment. Information obtained during screening operations may be used to initiate CI investigations and operations or to cue other intelligence collection disciplines such as HUMINT, IMINT, SIGINT, and MASINT.

11-11. **Debriefing**. CI Special Agents conduct debriefings of friendly force, HN, or the local population who may have information of CI interest regarding adversary intelligence collection or targeting efforts focused on US and multinational interests.

11-12. **Functional Services**. CI elements conduct functional services to assist traditional CI activities of investigations, collection, operations, analysis, and production; they also provide tailored support to US, DOD, and Army protection and security programs for commanders at all echelons. CI elements may use one or several of the functional services simultaneously to provide tailored support to a particular CI mission or supported program. CI functional services consist of—

- CI threat vulnerability assessments (TVAs).
- Adversary intelligence simulation (Red Team Evaluation).
- Covering agent support.

11-13. **CI Technical Services**. CI technical services are used to assist the CI functions of investigations, collections, and operations or to support functional services conducted by CI elements. For additional information on CI technical services, refer to AR 381-20 (SECRET/NOFORN) and FM 34-5. CI technical services consist of—

- Surveillance.
- Intelligence polygraphs.
- TSCM.
- Computer Network Operations (CNO).
- IO.
- Counter-Signals Intelligence (C-SIGINT).

ANALYSIS

11-14. IPB, all-source, and single-source analysis are used to template adversary intelligence activities. Analysis is also used to make recommendations to the commander on how to counter adversary intelligence efforts and to refine CI activities to potentially neutralize and/or exploit those efforts and to continually focus the efforts of CI teams. CI analysis focuses on the multidiscipline adversary intelligence collection threat targeting information on US multinational personnel, operations, activities, technology, and intentions. Raw information, open-source material, and finished intelligence products are analyzed in response to local and national requirements. Analysis occurs at all levels from tactical to strategic.

- At the tactical level, CI teams focus their efforts on supporting mission requirements and contributing to the all-source COP.
- Operational analysis is used to assess how adversary intelligence views and targets US interests; identify US vulnerabilities that could be exploited or targeted; and to determine adversary intelligence targeting methods of operation (MOs).
- CI collection priorities; assessing adversary intelligence technical options for countering US weapons and intelligence systems; and

assessing the impact of technology transfer activities on the US military's technological overmatch.

PRODUCTION

11-15. CI products consist of, but are not limited to, target nomination, CI input to TVAs, CI estimates, and investigative and intelligence information reports. Finalized intelligence derived from CI activities are incorporated into joint and national intelligence databases, assessments, and analysis products. CI products are also incorporated into the COP to support battlefield situational awareness. CI production takes place at all levels.

- Operational and tactical production includes tactical alerts, spot reports, and current intelligence; CI threat and/or vulnerability assessments tailored to specific activities, units, installations, programs, or geographic areas; CI studies to support contingency planning and major exercises; studies of adversary intelligence organization, MO, personnel, activities, and intentions that pose a current or potential threat to the supported command.
- Strategic products include assessments supporting national and Army programs including SAPs and acquisition programs; worldwide assessments of the organization, location, funding, training, operations capabilities, and intentions of terrorist organizations; global trends in adversary intelligence MO; after-action studies of individual espionage cases; analyses of the intelligence collection capabilities of international narcotics trafficking organizations; and multimedia threat products to support Army CI awareness programs.

TECHNICAL SERVICES

11-16. CI organizations with technically trained CI Special Agents are chartered with providing unique technical capabilities to augment CI investigations, collection, and operations. These technical capabilities are not used as substitutes for CI activities, but support traditional CI techniques employed to counter and neutralize adversary intelligence activities targeting US interests.

11-17. Selected CI Special Agents are trained to identify human deception indicators during the course of investigations, operations, and collection missions. Required training and skills include the use of polygraph and emerging biometric technologies that can recognize indications of deception by human sources, contacts, and subjects of investigations, as well as analysis and reporting of results.

11-18. TSCM CI Special Agents are trained in sophisticated electronic and sensing equipment to identify technical collection activities carried out by adversary intelligence entities. The use of TSCM is critical to ensuring that sensitive and/or restricted areas are clear of any adversary intelligence-placed active or passive electronic sensing, or eavesdropping or collection devices. These areas include SCIF, secure working and planning areas, and C2 facilities.

11-19. CNO consist of computer network attack (CNA), computer network defense (CND), and computer network exploitation (CNE). CI Special Agents

are specially trained in the areas of computer operation, network theory and administration, and forensics, along with IO in order to ensure US information dominance. The reliance on networked systems will result in greater emphasis being placed on information assurance. Specially selected CI agents will be trained in CNO in order to assist in protecting US information and information systems while exploiting and/or attacking adversary information and information systems.

11-20. For more information on technical services, refer AR 381-20 and FM 34-5.

OPERATIONAL EMPLOYMENT

11-21. Army CI supports the full spectrum of military operations. The Army requires a well-trained CI force consisting of AC, RC, civilian government employee, and contractor personnel. CI elements are focused on and dedicated to detecting, identifying, neutralizing, and/or exploiting adversary intelligence elements attempting to collect information on US forces. Effective employment of Army CI elements in all phases of operations and at all levels from tactical to strategic is paramount to countering any adversary intelligence threat to US interests and resources. Moreover, Army CI protects special programs that provide R&D, acquisition, and integration of technologies leading to future technological overmatch. CI elements have the capability and authority to conduct complex, nontraditional operations in this Information Age to CE, to both protect critical technologies and satisfy Army, DOD, and national level CI objectives.

LEVELS OF EMPLOYMENT

Strategic and Departmental

11-22. Strategic and departmental operations will be conducted by CI elements supporting national, DOD, and DA required missions (for example, support to NATO and special operations and missions). Strategic and departmental CI will conduct compartmented investigations and operations to affect the knowledge of adversary intelligence regarding CONOPS and defense information. Army CI will execute the full range of CI functions and missions at the strategic and departmental level including CI investigations and operations, CE, technology protection, SAP support, treaty verification, and technical CI services (polygraph, TSCM, and computer forensics). Strategic and departmental CI will also support SOF and special mission units (SMUs) within the scope of applicable national, DOD, and DA security policies and regulations.

Operational

11-23. Operational missions of CI elements will support combatant commanders, generally in geographic AOIR. Operational CI elements will focus on threat identification and countering regional adversary intelligence threats. Operational level CI activities and functions include CI investigations and operations, CE, technology protection, SAP support, treaty verification, and technical CI services (polygraph, TSCM, and computer

forensics). CI elements must be capable of quickly transitioning from a peacetime mission to crisis operations to support combatant commander requirements. Theater CI assets will conduct unilateral to multinational operations in designated theaters. Operational elements may also be deployed to support or reinforce tactical forces in CONOPS.

Tactical

11-24. CI teams will conduct operations throughout the battlespace during CONOPS. CONOPS support activities include conduct of CASO, limited CI investigative capability, personnel security investigations, screenings, and debriefings. CI activities in CONOPS focus on countering the adversary intelligence threat and assisting in conducting TVAs. TVAs will be conducted in conjunction with MPs, Engineers, and Medical Service personnel to provide the commander with a comprehensive FP assessment. During peacetime, organic tactical CI teams conduct activities in accordance with approved regulations and command guidance.

SUPPORT TO CONTINGENCY OPERATIONS

11-25. The initial phase of operations from PME to MTW lays the foundation of future team operations. In general, the priority of effort focuses inward on security of operating bases, areas of troop concentration, and C2 nodes to identify the collection threat to US forces that could be used by adversary elements to plan hostile acts against US activities and locations.

11-26. Once security of the operating bases has been established, the operational focus of CI teams shifts outside the operating base to continue to detect, identify, and neutralize the collection threat to US forces as well as to provide I&W of hostile acts targeting US activities. The CI team uses several collection methods, to include CASO, elicitation, and liaison, to answer the supported commander's requirements. This is referred to as the continuation phase. The CI team conducts CI investigations to identify, neutralize, and exploit reported threat intelligence collection efforts.

11-27. A key element to the CI team's success is the opportunity to spot, assess, and develop relationships with potential sources of information. Operating as independent teams, without being tied to ISR or combat assets, enables the CI team's maximum interaction with the local population, thereby maximizing the pool of potential sources of information. Along with the opportunity to spot, assess, and interact with potential sources of information, a second key element of a CI team's success is its approach-ability to the local population. A soft posture enables a CI team to appear as non-threatening as possible. Experience has shown that the local population in general is apprehensive of fully and openly armed patrols and soldiers moving around population centers.

11-28. During some operations, civilian attire or nontactical vehicles may be used to lower the CI team profile. In some special situations, these measures are taken to make the operation less visible to the casual observer. Also, in some cultures, sharing food and beverages among friends is expected; exceptions to restrictions or general orders should be considered to facilitate

successful CI team operations, many of which are geared towards developing relationships with potential sources of information.

SUPPORT TO INSTALLATIONS AND OPERATING BASES

11-29. CI teams, as part of a multi-agency team consisting of MPs, CA, medical, and EOD, support the conduct of TVAs of installations and operating bases to identify the intelligence threat to the operating locations. Detailed TVAs identify weaknesses in operational and physical security procedures and recommend countermeasures to mitigate intelligence collection on friendly forces limiting the ability to plan hostile acts on US activities and locations. CI activities supporting installations and operating bases include—

- Interviewing walk-in sources and locally employed personnel.
- Screening local national (LN) hires. Commanders, staff planners, and SIOs should always provide input to personnel assigned to establish and negotiate contracts using local national (LN) hires. This requirement ensures that LN hires can be screened, interviewed, and in some instances used as CI sources or assets in order to provide intelligence information that impacts the security of the base camp.
- Debriefing friendly force personnel who are in contact with the local population, such as—
  - ISR patrols.
  - MP patrols.
  - Combat patrols.
  - Liaison personnel.
  - CA and PSYOP teams.
- Conducting limited local open-source information collection.
- Providing support to TVAs of the base camp.

TACTICS, TECHNIQUES, AND PROCEDURES

11-30. At the CI team level, team members conduct mission analysis and planning specific to their AO. Backwards planning and source profiling are used extensively to choose CI targets. To verify adequate area coverage, the CI team may periodically develop and use CI target overlays and other CI analytical tools that illustrate the CI situation, identify CI gaps, and help refocus the collection effort.

11-31. The CI team is also in constant contact with the supported S2 and the other ISR assets (Scouts, PSYOP, CA, and MP) in order to coordinate and deconflict operations and to cross-check collected information. The supported unit S2, with the help of the CI team, regularly and systematically debriefs all ISR assets.

11-32. The CI team must be integrated into the supported unit's ISR plan. The CI OMT chief will advise the supported unit on the specific capabilities and requirements of the team to maximize mission success.

OPERATIONAL RISK MITIGATION

11-33. The employment of CI teams includes varying degrees of contact with the local population. As the degree of contact with the population increases, both the quantity and quality of CI collection increases. In many instances, however, there is a risk to the CI team inherent with increased exposure to the local population. The decision at what level to employ a CI team is METT-TC dependent. The risk to the CI assets must be balanced with the need to collect priority information and to protect the force as a whole. ROE, SOFA, direction from higher headquarters, and the overall threat level may also restrict the deployment and use of CI teams. The commander should consider exceptions to the ROE to facilitate CI collection.

11-34. Risks are minimized through the situational awareness of CI team members. They plan and rehearse to readily react to any situation and carry the necessary firepower to disengage from difficult situations. If it becomes necessary to call for assistance, adequate and redundant communications equipment is critical. These scenarios and actions should be trained prior to deployment into a contingency area and rehearsed continuously throughout the deployment.

11-35. A supported unit commander is often tempted to keep the CI team "inside the wire" when the THREATCON level increases. The supported commander must weigh the risk versus potential information gain when establishing operational parameters of supporting CI teams. This is necessary especially during high THREATCON levels when the supported unit commander needs as complete a picture as possible of the threat arrayed against US and multinational forces.

11-36. When it is not expedient to deploy the CI team independently due to threat levels or other restrictions, the team can be integrated into other ongoing operations. The CI team may be employed as part of a combat, ISR, or MP patrol or used to support CA, PSYOP, engineer, or other operations. This method reduces the risk to the team while allowing a limited ability to collect information. It has the advantage of placing the team in contact with the local population and allowing it to spot, assess, and interact with potential sources of information. However, this deployment method restricts collection by subordinating the team's efforts to the requirements, locations, and timetables of the unit or operation into which it is integrated and does not allow for the conduct of sensitive source operations. **This method of employment should be considered a last resort**.

COUNTERINTELLIGENCE EQUIPMENT

11-37. Basic C2, transportation, and weapons requirements do not differ significantly from most soldier requirements and are available as unit issue items. However, CI teams have unique communications, collection, processing, and mission-specific requirements.

COMMUNICATIONS

11-38. **Dedicated and Secure Long-Range Communications.** These are keys to the success of the CI team mission. CI team operations require a secure, three-tiered communications architecture consisting of inter/intra-team radios, vehicle-based communications, and a CI and HUMINT base station.

11-39. **Communications Network.** The CI team must have access to existing communications networks such as the tactical LAN. The CI team must also be equipped with its own COMSEC devices. It is imperative that the CI team acquire access to the public communication system of the HN. This can be in the form of either landlines or cellular telephones. Such access enables the CI team to develop leads which can provide early indicators to US forces.

11-40. **Interoperability.** Communications systems must be equipped with an open-ended architecture to allow for expansion and compatibility with other service elements, government organizations, NGOs, and multinational elements to effectively communicate during CONOPS. All ISR systems must be vertically and horizontally integrated to be compatible across all BOSs and with Legacy and Interim Force elements.

11-41. **SOTM.** To provide real-time and NRT information reporting, CI elements must have the capability to transmit voice, data, imagery, and video while on the move. CI teams must be able to transmit while geographically separated from their parent unit while operating remotely. This broadband requirement can only be achieved through a SATCOM capability and must be achievable while mobile.

CI COLLECTION AND PROCESSING SYSTEMS

11-42. The CI team must rely on automation to achieve and maintain information dominance in a given operation. With time, effective collection planning and management at all echelons, the CI team can collect a wealth of information. The sorting and analysis of this information in a timely and efficient manner is crucial to operations. Automation helps the CI team to report, database, analyze, and evaluate the collected information quickly and to provide the supported unit with accurate data in the form of timely, relevant, accurate, and predictive intelligence.

11-43. Automation hardware and software must be user friendly as well as interoperable among different echelons and services. They must interface with the communications equipment of the CI team as well as facilitate the interface of audiovisual devices. Technical support for hardware and software must be available and responsive.

11-44. The demand for accurate and timely CI reporting, DOCEX, and open-source information has grown tremendously. Biometric (physiological, neurological, thermal analysis, facial and fingerprint recognition) technologies will allow rapid identification, coding, and tracking of adversaries and human sources; as well as cataloging of information concerning EPWs, detainees, and civilians of CI interest on the battlefield. Biometrics will also provide secure authentication of individuals seeking network or facility access.

11-45. CI teams work with multinational forces and other foreign nationals and require the ability to communicate in their respective languages. Often CI personnel have little or no training in the target language, and lack of skilled interpreters can hinder CI activities. CI teams require textual and voice translation devices, source verification, and deception detection machines (biometrics) to improve collection capability and accuracy.

11-46. CI teams require dynamic MLT tools that provide both non-linguists and those with limited linguist skills a comprehensive, accurate means to conduct initial CI screenings and basic interviews in a variety of situations. CI elements will focus on in-depth interviews and communications with persons of higher priority. MLT tools minimize reliance on contract linguists and allow soldiers to concentrate on mission accomplishment.

MISSION SPECIFIC

11-47. The CI team may conduct night operations and must be equipped with NVDs for its members, and photographic and weapons systems. The CI team also may operate in urban and rural areas, where the threat level can vary from semi-hostile to hostile. The safety of the CI team can be enhanced with equipment that can detect, locate, suppress, illuminate, and designate hostile optical and E-O devices. In addition, high power, gyro-stabilized binoculars, which can be used from a moving vehicle, increases the survivability of the CI team and also gives the team another surveillance and collection device.

11-48. Some of the CI team missions may require the documentation of incidents. The CI teams can use the following equipment in their open-source collection efforts.

- Small, rugged, battery-operated digital camcorders and cameras which are able to interface with the collection and processing systems as well as communication devices.
- GPSs that can be mounted and dismounted to move in the AO efficiently.
- Short-range multichannel RF scanning devices that can also identify frequencies which enhance their security.
- In some cases CI teams require a stand-off, high resolution optical surveillance and recording capability that can provide target identification at extended ranges to protect the intelligence collector while avoiding detection by the adversary target. An advanced optical capability provides intelligence collectors the ability to locate and track adversary targets (passive and hostile) for identification, collection, and target exploitations.

INTEGRATION OF LINGUISTS

11-49. Integrating linguists into the CI team should take place as soon as possible. Security clearances and contractual agreements will help the team determine the level of integration.

11-50. Along with the basic briefing of what is expected of the civilian linguists as interpreters, CI teams should be informed about the civilians' chain of command and the scope of their duties beyond interpreting. The CI

team leader must ensure that linguists are trained and capable of completing all tasks expected of them.

BATTLE HAND-OFF

11-51. CI teams are always engaged. A good battle hand-off is critical to smooth transition and mission success. The battle hand-off can directly contribute to mission success or failure of the outgoing team, but especially of the incoming team. The battle hand-off begins the first day the CI team begins to operate in an AO. Regardless of how long the team believes it will operate within the AO, it must ensure there is a seamless transition to an incoming team, other US unit, or agency. The CI team accomplishes this transition by establishing procedures for source administration, database maintenance, and report files.

11-52. Teams must plan and implement a logical and systematic sequence of tasks that enables an incoming team to assume the operations in the AO. Adequate time must be allotted for an effective battle hand-off. In some environments, a few weeks may be necessary to accomplish an effective battle hand-off. Introductions to sources of information, especially CASO sources, are critical, and teams must prioritize their time. During this time the outgoing CI team must familiarize the new CI team with all aspects of the operation, which include past, present, and planned activities within the AO. Area orientation is critical. These include major routes, population centers, potential hot spots, and other points of interest (such as police stations, political centers, and social centers).

ORGANIZATION

11-53. CI activities require a complex C2 relationship to ensure that the requirements of the supported commander are fulfilled while balancing the need for strict integrity and legality of CI operations. This complex relationship balances the role of the SIO as the requirements manager and the 2X as the mission manager with the MI commander as the asset manager.

COMMAND VERSUS CONTROL

11-54. ARFOR will normally deploy as part of a joint, multinational, and/or combined operation. In all cases, commanders at each echelon will exercise command over the forces assigned to their organization. Command includes the authority and responsibility for effectively using resources, planning for and employment of forces, and ensuring that forces accomplish assigned missions. Leaders and staffs exercise control to facilitate mission accomplishment.

11-55. While the MI commander supervises subordinates and produces reports, the *2X synchronizes activities between intelligence units and provides single-source processing and limited analysis. **(*2X " indicates 2X functions at all levels.)** While the MI commander takes care of the operators executing missions, the *2X obtains the data and reports from higher echelons required to execute the missions.

STAFF RESPONSIBILITIES AND FUNCTIONS

11-56. The *2X staff is responsible for the integration, correlation, and fusion of all Human Sensor information into the Intelligence BOS within the *2X AOIR. The *2X is also responsible for analyzing adversary intelligence collection, terrorist and sabotage activities, developing countermeasures to defeat threat collection activities, identifying and submitting collection requirements to fill CI collection gaps, and providing input to the all-source picture regarding adversary intelligence activities.

11-57. The *2X Staff Officer provides CI and HUMINT collection expertise. The *2X—

- Is the single focal point for all matters associated with CI and HUMINT in the AOIR.
- Is the CI and HUMINT advisor to the G2 and commander.
- Is an extension of the collection manager and ensures that the best asset or combinations of assets are used to satisfy information requirements.
- Along with his subordinate elements—CICA, HOC, OSC, CIAC, and HAC—exercises technical control over his assigned Army CI and HUMINT elements in the designated AOIR.
- Is the principal representative of the G2 and the commander when coordinating and deconflicting CI and HUMINT activities with national or theater agencies operating in the AOIR.
- Supports specific RM efforts in conjunction with the requirements manager through the planning and coordination of CI and HUMINT operations; the review and validation of CI requirements; the recommendation for assignment of tasks to specific collectors; and the conduct of liaison with non-organic HUMINT collection. This liaison includes national level and multinational force assets for source deconfliction and special activities outside the *2X AOIR.
- Will provide OMTs with capability to reach back to current database information, technical information and guidance, and source deconfliction necessary to monitor the collection activities of the CI teams.
  - *CICA*. The CICA is responsible for coordinating and synchronizing all CI activities in the designated AOIR. The CICA exercises technical control over all CI entities in the designated AOIR and deconflicts CI activities with higher, lower, and adjacent CI elements. The CICA accomplishes all responsibilities through coordination with the operational units and other *2X staff elements.
  - *OSC*. The OSC in the *2X staff maintains the source registry for all CI activities in the designated AOIR. The OSC provides management of intelligence property book operations, source incentive programs, and ICFs.
  - *CIAC*. The CIAC analyzes adversary intelligence collection capabilities. The CIAC leverages all intelligence discipline reporting and analysis to counter threat collection capabilities against the deployed force. CIAC analysis provides information and analysis to the COP.

11-58. The ACE and JISE CI analysis team analyzes threat intelligence collection and the intelligence collection efforts of foreign organizations involved in terrorism and sabotage in order to develop countermeasures against them. CI analysis cross-cues IMINT, SIGINT, MASINT, and TECHINT resources in addition to CI-related HUMINT reporting and analysis to counter threat collection capabilities against the deployed force. While the HAC supports the positive collection efforts of the force, the CI analysis team supports the "defend" aspects of the commander's FP program.

11-59. CI analysis is the analysis of the adversary's HUMINT, IMINT, SIGINT, and MASINT capabilities in support of intelligence collection, terrorism, and sabotage in order to develop countermeasures against them. It involves a reverse IPB process in which the analyst looks at US forces and operations from the threat's perspective. CI analytical products are an important tool in the COA development in the MDMP. This analytical tool supports the commander's FP program and facilitates the nomination of CI targets for neutralization or exploitation. (See FM 2-01.2 (FM 34-60) for more information on CI analysis.) Specifically, CI analysis—

- Produces and disseminates CI products and provides input to INTSUMs.
- Provides collection requirements input to the CICA.
- Analyzes source reliability and credibility as reflected in reporting and communicating that analysis to the collector.
- Nominates CI targets for neutralization or exploitation.
- Identifies and submits CI-related requirements to fill collection gaps.
- Assists HAC personnel in focusing the CI aspects of the HUMINT collection program.
- Presents CI analysis products such as CI estimates, target lists, reports, and graphics that support the commander.

11-60. For intelligence reach operations, CI products are available and disseminated in a variety of forms. It is incumbent on the requestor to ensure the CI product can be transmitted over the available communications systems. This includes verifying the appropriate security level of the communications systems.

CI TEAM STRUCTURE

11-61. **OMT.** The OMT is a four-person team consisting of a WO, two NCOs, and a junior enlisted soldier. (Civilians may be inserted into this structure as appropriate.) Rank structure and standards of grade for OMTs will vary depending upon the skill sets required and mission focus. CI OMTs will provide operational guidance for 1 to 4 CI teams, depending on mission focus and operational tempo. When two or more CI teams are deployed in a DS role, an OMT is also deployed to provide technical control. The OMT works closely with the supported S2 and ACT to furnish current threat information and to answer the supported commander's PIRs and IRs. OMTs coordinate with the supported 2X and manage subordinate CI teams to—

- Provide guidance and technical control of operational activity.
- Provide the collection and operational focus for CI teams.

- Provide quality control and dissemination of reports for subordinate CI teams.
- Conduct single-discipline CI analysis and assist in mission analysis for the supported commander.
- Act as a conduit between subordinate CI teams, the CICA, and supported unit headquarters.
- Provide administrative support for subordinate CI teams to include reporting mission and equipment status to the CICA and the supported unit headquarters.
- Educate the supported commander on the capabilities of the CI teams.
- Integrate the CI teams directly into the maneuver commander's ISR planning.

11-62. **CI Team.** The CI team is a four-person team consisting of two NCOs and two junior enlisted personnel. Rank structure and standards of grade for CI teams will vary depending upon the skill sets required and mission focus. CI teams are trained to execute the full range of CI functions; however, they may be assigned to mission-focused elements (for example, CE, CI projects). Assignment to a TSCM, polygraph, or information warfare team requires additional, specialized technical training.

Appendix A

Intelligence and Information Operations

THE INFORMATION ENVIRONMENT

A-1. The information environment is the aggregate of individuals, organizations, and systems that collect, process, store, display, and disseminate information; also included is the information itself. (FM 3-0) The information environment, it should be noted, is not an exclusively military one; in fact, the military applications of information are almost obscured in today's universal usage of the information spectrum by national, international, and non-state players.

THE COMMANDER AND INFORMATION

A-2. Information is facts, data, or instructions in any medium or form; the meaning that a human assigns to data by means of the known conventions used in their representation. (JP 1-02) Information provides the key to battlefield success in the 21st century. Commanders must have detailed information to command. Information is the medium that allows the commander's decisionmaking and execution cycle to function. Information gives direction to actions by the force, identifies the enemy's centers of gravity, provides COAs for force activity, and enables the force to accomplish its operational mission.

INFORMATION SUPERIORITY

A-3. Information superiority is the operational advantage derived from the ability to collect, process and disseminate an uninterrupted flow of information while exploiting or denying an adversary's ability to do the same. (FM 3-0) Relevant information drawn from intelligence supports the creation and development of situational understanding that contributes directly to information superiority during decisive operations. The requirement for information superiority is not new; what is new is that today's information technologies are creating a base of knowledge for military planning and execution that is unprecedented in scope, volume, accuracy, and timeliness. This means commanders receive accurate, timely information that enables them to make better decisions and act faster than their adversaries.

A-4. Information superiority, however, is neither a staple in today's battlespace nor is it necessary in military operations as a constant condition; rather, at specific times during operations, information superiority becomes a key enabler for assuring military success. At the operational level of predominant interest to the land component commander (LCC), information superiority is realized through the integration of operational level, interdependent ISR, information management, and IO to gain and maintain operational initiative and to achieve an operational advantage.

INFORMATION OPERATIONS

A-5. IO are the employment of core capabilities of electronic warfare, computer network operations, PSYOP, military deception, and operations security, in concert with specified supporting and related capabilities to affect or defend information and information systems, and to influence decisionmaking…. Information systems are…the equipment and facilities that collect, process, store, display, disseminate information. These include computers, hardware, software, and communications, as well as policies and procedures for their use. (FM 3-0). Offensive IO are capable of degrading an adversary's will to resist and ability to fight. Defensive IO measures passively and actively protect friendly information and C2 systems and limit their vulnerability.

A-6. Offensive and defensive IO are conducted as a fully coordinated effort to ensure the complementary, asymmetric, and reinforcing effects to attack enemy forces, influence others, and protect friendly forces. Relevant information assures that the right person has the right information at the right time for decisionmaking and execution.

THE ELEMENTS OF IO

A-7. Full-spectrum IO incorporates, integrates, and synchronizes traditionally independent capabilities and activities in support of the commander's mission. (See FM 3-0 and FM 3-13.) The Army's doctrinal view of full-spectrum IO as evolving core capabilities are—

- PSYOP.
- OPSEC.
- EW.
- Military deception.
- CNO.
  - CNA.
  - CND.
  - CNE.

A-8. Supporting IO capabilities are—

- Physical destruction.
- Physical security.
- Information assurance.
- Counterpropaganda.
- Counterdeception.
- Counterintelligence.

IO-RELATED ELEMENTS

A-9. The IO-related activities of PA and CMO are closely associated and integrated with the elements of IO as key contributors to information superiority.

INTELLIGENCE SUPPORT TO IO

A-10. All-source intelligence support, encompassing all of its forms, is the principal enabler for successful IO. The commander's capability to synchronize military operations can be heavily influenced by the ability to identify the threat and understand the adversary's capabilities and intentions in the information environment.

A-11. It is essential that the elements of the command's IO capabilities and vulnerabilities are integrated into the command intelligence plan. This leads to COAs that synchronize the elements of IO and IO-related activities into the commander's warfighting plans. Integration of the full-spectrum aspects of IO ensures that the relative importance of information is recognized in the development of a synchronized OPLAN. Further, integration of IO into the planning process provides a methodology for analyzing the threat from a knowledge base that enhances protection of friendly systems and assets while exposing windows of opportunity for attack or exploitation. IPB is the best process we have for understanding the battlefield and the options it presents to friendly and threat forces.

A-12. Provide Intelligence support to IO includes, but is not limited to, the following:

- **Provide Intelligence Support to Offensive IO**. The Intelligence BOS supports offensive IO by providing information to identify critical enemy C2 nodes. Intelligence also helps to identify enemy systems and procedures that may be vulnerable for offensive IO. Additionally, intelligence plays a key role in evaluating and assessing the effectiveness of offensive IO.
  - *Provide Intelligence Support to PSYOP*. This task identifies the cultural, social, economic, and political environment of the AO. It identifies target groups and subgroups and their location, conditions, vulnerabilities, susceptibilities, cultures, attitudes, and behaviors. PSYOP influence foreign target audiences in the AO to support achieving the commander's goals in the AO.
    - Identify the cultural, social, economic, and political environment of the AOI; for example, adversary mechanisms for political control, adversary communication and broadcast systems used to elicit support from the populace, and current and past adversary propaganda activities and their effectiveness.
    - Identify target groups and subgroups and their location, conditions, vulnerabilities, susceptibilities, cultures, attitudes, and behaviors. This includes determining the audience demographics of popular radio and television programs and periodicals; groups influenced by media personalities and political cartoons.
    - Identify impact of planned PSYOP on individuals outside the targeted group (for example, multinational partners, neighboring populations).
  - *Provide Intelligence Support to Military Deception*. This task identifies the capabilities and limitations of the adversary's

intelligence-gathering systems and identifies adversary biases and perceptions.
  - Profiles of key adversary leaders.
  - Cultural, religious, social, and political characteristics of the country and region.
  - Sources of military, economic, or political support.
  - Adversary decisionmaking processes, patterns, and biases.
  - Adversary perceptions of the military situation in the AO.
  - Capabilities and limitations of adversary CI and security services.
- *Provide Intelligence Support to Electronic Attack*. This task supports electronic attack employing jamming, electromagnetic energy, or directed energy against personnel, facilities, or equipment. It identifies critical adversary information systems and C2 nodes. It includes determining and presenting the adversary's electronic OB and their information system infrastructure. The enemy's C2 system vulnerabilities and the means they use to protect their C2 systems is part of the electronic OB.

- **Provide Intelligence Support to Defensive IO**. The Intelligence BOS supports defensive IO by providing information to identify threat IO capabilities and tactics. Intelligence provides information relating to CND, physical security, OPSEC, counterdeception, and counterpropaganda. The Intelligence BOS supports defensive IO by providing information to identify threat IO capabilities and tactics. Intelligence provides information relating to CND. Provide Intelligence Support to OPSEC—identify capabilities and limitations of the adversary's intelligence system to include adversary intelligence objectives and the means, methods, and facilities used by the threat to collect, process, and analyze information—supports the identification of indicators that could be interpreted or pieced together to penetrate EEFI in time to be useful to adversaries.
- **Provide Intelligence Support to Activities Related to IO**. The Intelligence BOS when operating outside US territories supports activities related to IO under some circumstances.
  - *Provide Intelligence Support to CMO*. This task allows military intelligence organizations to collect and provide information and intelligence products concerning foreign cultural, social, economic, and political elements within an IO in support of CMO. Identify cultural, social, economic, and political environment of the AOI, including—
    - Population demographics.
    - Civilian populace attitudes, alliances, and behavior.
    - Availability of basic necessities (food, clothing, water, shelter, medical care) and the ability of the populace to care for itself.
    - Access to medical care.
    - Locations and potential routes, destinations, and assembly areas or sites of displaced persons.
    - Local government type, status, organization, and capabilities.

  - Availability of local material and personnel to support military operations.
  - NGOs in the AOI, their agenda, resources, and capabilities.
- *Provide Intelligence Support to Public Affairs*. This task identifies the multinational and foreign public physical and social environment, as well as world, HN national, and HN local public opinion, in addition to the propaganda and misinformation capabilities, activities, targets, themes, and dissemination means of the adversary. Identify world, national, and local public opinion (location, biases or predispositions, and agenda of national and international media representatives in the AOI, and trends reflected by the national and international media).

Appendix B

Linguist Support

ROLE OF LINGUISTS

B-1. Military operations are highly dependent on foreign language support. The requirement to communicate with and serve on multinational staffs, communicate with local populations, and exploit enemy forces necessitates the use of linguists. The growing focus on multinational operations increases the competition for limited linguist resources that are vital for mission success. This appendix establishes the framework and process to access, prioritize, and employ the Army's limited organic linguist resources.

LINGUISTIC SUPPORT CATEGORIES

B-2. Foreign language support requirements of US Armed Forces typically fall into one of four broad categories:

- Intelligence and Information Gathering. This category includes the traditional SIGINT and HUMINT disciplines, as well as foreign language support to FP and exploitation of open-source information.
- CMO. This category encompasses all functions relating to military interaction with the civilian population. Foreign language support is critical to CMO in areas such as government liaison, legal agreements, medical support and operations, law enforcement, engineering projects, public safety, security and population control, CA, and PSYOP.
- Logistics. This category consists of foreign language support to sustainment or transportation functions. These include logistical contracting, port, railhead, airhead, or transshipment operations and convoy operations.
- Multinational Operations and Liaison. This category includes the coordination of military operations and liaison with multinational partners, previously unaffiliated nations, and at times adversary or former adversary nations. Multinational operations are becoming more common and increasingly important.

DETERMINING LINGUIST REQUIREMENTS

B-3. To identify linguist requirements, the staff conducts mission analysis and identifies specified or implied tasks requiring foreign language support. Other critical factors are the organization or echelon of command and the location of the mission. The staff uses these criteria to determine the allocation of linguists, such as one linguist team per echelon of command, one linguist per piece of equipment, or one linguist team per location where the function is to be performed. The staff then applies task organization and scheme of maneuver to determine the number of linguists needed for an operation.

B-4. The staff must analyze each linguist assignment to determine the minimum level of foreign language proficiency needed. While interpretation for a peace negotiation requires not only outstanding linguistic capability but also cultural acumen, the translation of routine documents (with the aid of a dictionary) requires a much different skill set. Poor identification of linguist proficiency requirements can tie up the best linguists in less effective roles, creating linguist shortfalls in other areas.

B-5. The relative importance of each of the four linguist support categories is mission dependent. For example, during a NEO civil and military coordination would probably not be as critical as intelligence and information gathering. However, the situation is reversed for a humanitarian assistance mission in which CMOs have a significant impact on mission success. Identifying these "dynamics" helps the commander and staff prioritize linguist requirements.

B-6. Determining linguist requirements for any operation can be difficult because each operation is unique. However, commanders and staffs with a basic knowledge of organic Army linguistic assets, foreign language resource alternatives, and MI skills can successfully assess, prioritize, and employ linguists in support of their military operations.

PLANNING AND MANAGING LINGUIST SUPPORT

B-7. Commanders must consider the linguist requirements as part of their MDMP for every CONPLAN and OPLAN assigned to their commands. Prior staff planning and identification of linguist requirements should prompt commanders to initiate linguist support requests and identify command relationships prior to actual operations. If the mission analysis reveals requirements for linguistic support, the commander must identify what foreign languages are needed, the foreign language proficiency levels needed for each assignment, and the best source of linguists. In addition, if the mission includes intelligence and information collection, the commander must identify MI collection skills required. During mission analysis, the commander should consider linguist requirements for every CONPLAN and OPLAN assigned to his command.

LINGUIST CATEGORIES

B-8. The commander and staff must identify linguist requirements by category:

- Category I – Have native proficiency in the target language (level 4-5) and an advanced working proficiency (Interagency Language Round Table [ILRT] level 2+) in English. They may be locally hired or from a region outside the AO. They do not require a security clearance. They must be screened by the Army CI support team.
- Category II – Are US citizens screened by Army CI personnel and are granted access to SECRET by the designated US government personnel security authority. Have native proficiency in the target language (level 4-5) and an advanced working proficiency (ILRT 2+) in English.
- Category III – Are US citizens screened by Army CI personnel and are granted either TS/SCI clearance or an interim TS/SCI clearance by the

designated US government personnel security authority. Meet a minimum requirement of ILRT level 3. They are capable of understanding the essentials of all speech in a standard dialect. They must be able to follow accurately the essentials of conversation, make and answer phone calls, understand radio broadcasts and news stories, and oral reports (both of a technical and non-technical nature).

PRIMARY STAFF RESPONSIBILITIES

B-9. Primary staff at each echelon has responsibilities for evaluating requirements and managing linguist support. The responsibilities include but are not limited to those discussed below. In addition, each staff section is responsible for determining its linguist support required to meet its operational missions.

Assistant Chief of Staff, G1 (S1):

- Identify linguist requirements needed to support G1/S1 functions in all contingency areas. G1/S1 requirements for linguist support include but are not limited to the following:
  - Coordinate with local authorities on matters of civilian hire, finance, and recordkeeping.
  - Contract for local hire personnel.
  - Coordinate for local morale support and community activities.
  - Coordinate with local authorities for postal operations.
  - Support for administration, counseling, personal affairs, and leave for LN and third-country national (TCN) personnel.
  - Coordinate for local medical support.
  - Liaison with multinational counterparts.
- Linguist staffing and linguist replacement management.
- Identify foreign language skill identifiers for all assigned, attached, or OPCON Army linguists.
- Identify all Army foreign language skilled soldiers not identified on electronic Military Personnel Office System (eMILPO) and Defense Integrated Management Human Resource System (DIMHRS). The Standard Installation Division Personnel System (SIDPERS) was replaced by eMILPO.
- Deploy and provide administrative support of DA and DOD civilian linguists.
- Hire, contract for, and provide administrative support of LN linguists.
- Procure Army foreign language support personnel for screening local labor resources.

Assistant Chief of Staff, G2 (S2):

- Identify linguist requirements needed to support G2/S2 functions in all contingency areas. G2/S2 requirements for linguist support include but are not limited to—
  - Evaluate and/or use local maps and terrain products in operations.
  - Process for MI purposes material taken from EPWs or civilian internees.

  - At lower echelons, conduct tactical questioning of refugees, detainees, and EPWs.
  - Assess local open-source information for intelligence value.
  - Coordinate intelligence and liaison with multinational and HN counterpart.
- Determine, during the initial IPB, all foreign languages (spoken and written) and dialects needed for mission accomplishment.
- Collect, process, produce, and disseminate information derived from linguist sources.
- Provide intelligence training for MI linguists employed in AOs.
- Coordinate for security investigations, as necessary, for local hire linguists.
- Provide support to CI screening of contracted linguists and LN labor force.

Assistant Chief of Staff, G3 (S3):

- Identify linguist requirements needed to support G3/S3 functions in all contingency areas. G3/S3 requirements for linguist support include but are not limited to—
  - Operational coordination and liaison with multinational and HN counterparts.
  - Translate OPORDs and OPLANs for use by multinational counterparts.
- Consolidate unit linguistic requirements and establish priorities.
- Develop linguist deployment and employment plans.
- Develop plans to train linguists and to use linguists for training the force in AO's foreign language survival skills. In addition to global language skills, linguists must have training in specific vocabulary used in the AO; for example, terms used for military, paramilitary, civilian or terrorist organizations, and ethnic groups within the area, nomenclatures of equipment used, and other military or technical vocabulary. Training in the specific dialect used in the AO would also be beneficial.
- Assign, attach, and detach linguists and linguist teams.
- Integrate additional or replacement linguists through operational channels.
- Recommend modernization and development of linguist systems and methods.
- Coordinate mobilization and demobilization of RC linguist support.
- Plan linguist usage for deception operations.
- Plan linguist support for movement of EPWs, detainees, and refugees.
- Coordinate evaluation of linguist support by all staff elements.

Assistant Chief of Staff, G4 (S4):

- Identify linguist requirements needed to support G4/S4 functions in all contingency areas. G4/S4 linguist requirements for linguist support include but are not limited to—

- Procure local supply, maintenance, transportation, and services.
- Coordinate logistics at air and seaports of debarkation.
- Contract with local governments, agencies, and individuals for sites and storage.

- Provide logistical, supply, maintenance, and transportation support to attached linguists.

Assistant Chief of Staff, G5 (S5):

- Identify linguist requirements needed to support G5/S5 functions in all contingency areas. G5/S5 linguist requirements for linguist support include but are not limited to—
  - Determine civilian impact on military operations.
  - Minimize civilian interference with combat operations.
  - Inform civilians of curfews, movement restrictions, and relocations.
  - Provide assistance to liaison with HN and multinational agencies, dignitaries, and authorities.
  - Promote positive community programs to win over support.
  - Determine if multinational operations PSYOP efforts are mutually planned and synchronized.
  - Interpret support to assist resolution of civilian claims against the US Government.
  - Solicit linguistic and cultural knowledge support to protect culturally significant sites.
  - Use linguistic and cultural support to identify cultural and religious customs.
- Assist the G1 in the contracting of local hire linguists.
- Identify foreign language requirements for CMOs.

Assistant Chief of Staff, G6 (S6):

- Identify linguist requirements needed to support G6/S6 functions in all contingency areas. G6/S6 linguist requirements for linguist support include but are not limited to—
  - Coordinate suitable commercial information systems and services.
  - Coordinate with multinational forces on command frequency lists.
  - Coordinate signal support interfaces with HN and multinational forces.
- Manage RF assignments for supporting SIGINT linguist elements.
- Support linguist operations with internal document reproduction, distribution, and message services.
- Integrate automation management systems of linguist units.

SPECIAL STAFF OFFICER RESPONSIBILITIES

B-10. If no special staff officer is assigned the duties below, the corresponding coordinating staff officer should assume those responsibilities. Linguist requirements for special staff officers include but are not limited to the following staff officers.

Liaison Officer:

- Should speak the required foreign language. If not, he requires a translator or interpreter for all aspects of his duties.
- Request interpreters to assist when representing the multinational operations.
- Translate orders, maps, traces, overlays, and documents into multinational foreign languages.

Civilian Personnel Officer:

- Recruit, interview for suitability, and hire civilian local labor force if required.
- Negotiate host country on labor agreements.

Dental Surgeon:

- Administer dental care to support humanitarian mission requirements.
- Rehabilitate, construct, and gain usage of existing dental facilities as required.

Finance Officer:

- Support the procurement process of local goods and services not readily available through normal logistical channels.
- Ensure limited non-US and US pay functions to foreign national, HN, civilian internees, and EPWs are provided.
- Ensure all necessary banking functions are performed in theater.

Surgeon:

- Support medical humanitarian assistance and disaster relief operations.
- Provide medical care of EPWs and civilians within the command's AO.
- Coordinate medical laboratory access in AO.
- Determine the nature of local health threats to the force through populace interviews.
- Determine the identity of local or captured medical supplies.

Veterinary Officer:

- Determine source and suitability of local foods.
- Assist the local population with veterinary service needs.

Chemical Officer:

- Identify enemy force chemical weapons and equipment.
- Communicate NBC risks to supported populations.

Engineer Coordinator:

- Procure proper local materials to support engineering missions.
- Communicate engineering project requirements to contracted local work force.

- Communicate engineering project impact on local landowners and other affected parties.
- Determine, in coordination with G2/S2, suitability of local topographic maps and terrain products.
- Assess environmental concerns of HN and local populations in combined operations.

Provost Marshal:

- Support dislocated and civilian straggler control activities.
- Support internment and resettlement operations, to include displaced civilians.
- Support weapons buy-back programs, as required, and work closely with civil-military liaisons for payments to local officials.
- Support counter-drug and customs activities.
- When authorized, help foreign civil authorities maintain control.
- Conduct liaison with local LEAs.

PSYOP Officer:

- Produce approved PSYOP propaganda and counter-propaganda media.
- Evaluate PSYOP impact on target audience.

Air Defense Coordinator:

- Identify enemy air defense artillery (ADA) weapons and radars.
- Communicate air defense warnings to supported populations.
- Communicate air defense project requirements to contracted local work force.

Safety Officer:

- Provide safety training to local labor force.
- Communicate warnings of dangerous military operations and other hazards to local populace.

Transportation Officer:

- Coordinate commercial and local transportation needs.
- Coordinate movement scheduling and routes with multinational forces and/or HN.

PERSONAL STAFF OFFICER RESPONSIBILITIES

B-11. Personal staff officers are under immediate control of the commander and have direct access to the commander. Most personal staff officers also perform special staff officer duties, working with a coordinating staff officer. These assignments are on a case-by-case basis, depending on the commander's guidance and the nature of the mission; they are very common in stability operations and support operations. Linguist requirements for special staff officers include but are not limited to the following staff officers.

Chaplain:

- Coordinate religious support with multinational partners.
- Determine the impact of local population religious group faiths and practices on military operations.
- Provide religious support to the community to include hospital patients, EPWs, refugees, and civilian detainees.
- Conduct liaison with local population religious leaders in close coordination with the G5.

Public Affairs Officer:

- Act as the commander's spokesman for all communication with external media.
- Assess the accuracy of foreign media interpretation of Public Affairs Office (PAO) releases.
- Assess and recommend news, entertainment, and other information (assisting G5) for contracted services foreign nationals.

Staff Judge Advocate:

- Translate and interpret foreign legal codes, SOFAs, and international laws.
- Determine local environmental laws and treaties through translation services.
- Assess the treatment of EPWs and civilian internees.
- Translate documents to support G4 in local contracts.

SOURCES OF LINGUISTS

B-12. There are various sources that a commander can use to obtain the linguists necessary to support operations. It is vital to know the advantages and disadvantages of each type of linguist and to carefully match the available linguists to the various aspects of the operation.

ARMY LANGUAGE-QUALIFIED MOSs

B-13. The AC MI language-dependent military occupational specialities (MOSs) are 98G with a skill qualification identifier (SQI) of L/352G (Cryptologic Communications Interceptor/ Locator), and their related WO fields. Some soldiers in MOS 96B (All-Source Intelligence Analyst), MOS 97B (CI Agent), MOS 97E/351E (HUMINT Collector) and MOS 98C (SIGINT Analyst), and their related WO fields are trained in foreign languages. Using soldiers in the MOSs mentioned above has many advantages. They are already trained in the military system, are not subject to deployment restrictions (a limiting factor with civilian linguists), have a security clearance and, as US personnel, support the command's interests. The major disadvantage to utilizing these individuals for general foreign language support is that in doing so, they are removed from their primary MI functions. They should be used only in linguistic duties that include intelligence potential. For example, a HUMINT collector (97E) provides linguist support to a medical assistance team as a method to provide access to the local population to determine their attitudes toward US Forces.

B-14. Non-MI Army language qualified MOSs include some enlisted and WOs in career management fields 18 (Special Forces), 37 (PSYOP), 180A (Special Forces); and commissioned officers with a branch code 18 (Special Forces); and functional areas 39 (PSYOP and CA) and 48 (Foreign Area Officer). Particular attention must be paid to the recorded language proficiency and test date of these individuals since the standards vary by field. The same advantages and disadvantages apply as with the AC MI linguists.

B-15. RC language-dependent MOSs include those listed above in the AC. RC linguists have the same set of advantages and disadvantages as listed above for AC language-dependent MOSs. The RC also includes linguists in MOS 97L (translator/interpreter). The 97Ls are specifically trained to be a translator and interpreter. They have the same advantages as the AC linguists. An added advantage is that since their sole job is translation and interpretation, they do not have to be removed from another job in order to be used as a linguist. Their major disadvantage is that they have no additional skill that gives them dual functionality.

Army Linguists Not DOD Trained

B-16. The Army also includes numerous soldiers of all grades who are proficient in a foreign language and are receiving Foreign Language Proficiency Pay (FLPP) but whose primary duties do not require foreign language proficiency. They may have attended a civilian school to learn a foreign language, or they may have acquired proficiency through their heritage. They have the advantage of being trained soldiers and are therefore readily deployable to all areas of the battlefield.

B-17. These soldiers may have the specific vocabulary and military skill knowledge for certain linguist support missions. For example, a supply sergeant who speaks the local language would be an invaluable asset to the G4. There are disadvantages in that they already have another job and units are reluctant to give up personnel especially if they are in key positions. Their capabilities are difficult to assess. Since they are not required to take the Defense Language Proficiency Test (DLPT) if they are not receiving FLPP, it is often difficult for the G1/S1 to identify them as a linguist or for a non-linguist to judge the level of their foreign language capability.

Other Service Linguists

B-18. Other service linguists have the advantage of deployability, loyalty, and clearance, but must often learn the Army system and specific Army vocabulary. They are also difficult to obtain since their parent service probably also lacks a sufficient number of trained linguists. Other service linguists, however, will be valuable in joint operation centers and joint activities. When serving the JTF headquarters, Army commanders and staffs must be aware of the linguists in the other services in order to plan for the participation and optimize their employment.

US Contract Linguists

B-19. US civilians can be contracted to provide linguist support. They have an advantage over LN hires in that their loyalty to the US is more readily evaluated, and it is easier for them to be granted the necessary security

clearance. However, there are usually severe limitations on the deployment and use of civilians. A careful assessment of their language ability is important because, in many cases, they use "old fashioned" terms, or interject US idioms. If the linguists are recent émigrés, the use of the language in their country of origin could be dangerous to them, or their loyalty may reside with their own country when at odds with US interests.

Multinational Linguists

B-20. Multinational linguists have their own set of advantages and disadvantages. These linguists may be unfamiliar with the US military system unless they have previously participated in a multinational operation with US forces. They may have a security clearance, but clearances are not necessarily equal or reciprocal, automatically guaranteeing access to classified or sensitive information between nations. They support the command's interest but may have differing priorities or responsibilities within their assigned AOs. These linguists also are already fulfilling specific duties for their own nation, which may also have a shortage of linguists. The major disadvantage to acquiring and maintaining multinational linguist support is that they are outside the C2 (via military authority or military contract) of the US forces. These linguists will be valuable in multinational operations centers and activities.

Local National Contract Linguists

B-21. LN hires will provide the bulk of your linguist support. They are usually less expensive to hire than US civilians and will know the local dialect, idioms, and culture. The expertise of these linguists in particular areas or subject matters can be an asset. However, there are several potential problems with using LN hires, to include limited English skills and loyalty considerations. Therefore, a screening interview or test is necessary to determine their proficiency in English. These individuals must also be carefully selected and screened by CI personnel (with US linguist support) initially and periodically throughout their employment. Their loyalty is always questionable. Local prejudices may influence them, and they may place their own interests above those of the US.

EVALUATING LINGUIST PROFICIENCY

B-22. Commanders and staffs must understand the Army linguist proficiency evaluation system in order to effectively plan for and employ linguists. Evaluation and reevaluation of linguist proficiency is covered in detail in AR 611-6, Section III. Language testing is required for all Army personnel in a language-dependent MOS, who have received foreign language training at government expense, who are receiving FLPP, or who are in a language-required position regardless of MOS. Other Army personnel who have knowledge of a foreign language are encouraged to take the proficiency test and may work as linguists.

B-23. The Army uses the DLPT to determine foreign language proficiency levels. DLPTs are listed by foreign language in DA Pam 611-16. In foreign languages where no printed or recorded test exists, oral interview tests are arranged. The DLPT is an indication of foreign language capability, but it is

not the definitive evaluation of an individual's ability to perform linguist support.

B-24. AR 611-6, Appendix D, Sections 1 through 4, describes the proficiency levels for the skills of speaking, listening, reading, and writing a foreign language based on the interagency roundtable descriptions. The plus-level designators, shown as a "+" symbol, are used to designate when a linguist is above a base level, but not yet to the capability of the next level. For example, 2+ would indicate a better than limited working proficiency in the foreign language. The six "base levels" of proficiency, as established by DLPT and/or oral exam, are—

- Level 0 (No proficiency). The soldier has no functional foreign language ability. Level 0+. The minimum standard for Special Forces personnel indicates a memorized proficiency only.
- Level 1 (Elementary proficiency). The soldier has limited control of the foreign language skill area to meet limited practical needs and elementary foreign language requirements.
- Level 2 (Limited working proficiency). The linguist is sufficiently skilled to be able to satisfy routine foreign language demands and limited work requirements.
- Level 3 (General professional proficiency). The linguist is capable of performing most general, technical, formal, and informal foreign language tasks on a practical, social, and professional level.
- Level 4 (Advanced professional proficiency). The linguist is capable of performing advanced professional foreign language tasks fluently and accurately on all levels.
- Level 5 (Functionally native proficiency). The linguist is functionally equivalent to an articulate and well-educated native in all foreign language skills; and reflects the cultural standards of the country where the foreign language is natively spoken.

B-25. The above proficiency base levels designate proficiency in any of the four language skills: listening, reading, speaking, and writing. The most evaluated skills on the DLPT are reading and listening. These tests are <u>not</u> for use in evaluating linguists above the 3 proficiency level. Most Army linguist DLPT scores show only two skill levels: listening and reading (for example, 2+/3, or 3/1+).

SUSTAINING MILITARY LINGUIST PROFICIENCY

B-26. Language proficiency diminishes with lack of use and absence of exposure to the foreign language. To ensure combat readiness, commanders should require all military linguists receive periodic language training. In-country language immersion training, in-garrison contracted language instructors, on-line foreign newspapers, and foreign radio broadcasts are all examples of language training resources. Funding for language training is available through MACOM language training program funds.

Glossary

The glossary lists acronyms and terms with Army or joint definitions, and other selected terms. Where Army and joint definitions are different, (Army) follows the term. Terms for which FM 2-0 is the proponent FM (authority) are marked with an asterisk (*) and followed by the number of the paragraph (¶) where they are discussed. For other terms, the number of the proponent FM follows the definition. JP 1-02 and FM 1-02 are posted in the Joint Electronic Library, which is available online and on CD-ROM.

COMINT	communications intelligence
COMSEC	communications security
CONOPS	contingency operations
CONPLAN	contingency plan
CONUS	continental United States
COP	common operational picture
COSCOM	Corps Support Command
***counterintelligence**	**1.** Information gathered and activities conducted to protect against espionage, other intelligence activities, sabotage, or assassinations conducted by or on behalf of foreign governments or elements thereof, foreign organizations, or foreign persons, or international terrorist activities. (JP 1-02) **2.** (Army) Counterintelligence counters or neutralizes intelligence collection efforts through collection, CI investigations, operations, analysis and production, and functional and technical services. CI includes all actions taken to detect, identify, exploit, and neutralize the multidiscipline intelligence activities of friends, competitors, opponents, adversaries, and enemies; and is the key intelligence community contributor to protect US interests and equities. (FM 2-0) (¶1-111)
CP	command post
CRN	command radio net
CS	combat support
CSG	cryptologic support group
CSS	combat service support
CSSCS	Combat Service Support Control System
CT	Counterterrorism
***cueing**	The use of one or more sensor systems to provide data that directs collection by other systems. (¶2-53)
CWT	combat weather team
DA	Department of the Army
DAC	Department of the Army Civilian
DAPDM	Department of the Army Production and Dissemination Management
DCI	Director of Central Intelligence
DCS, G2	Deputy Chief of Staff, Intelligence

***debriefing**	The systematic questioning of individuals to procure information to answer specific collection requirements by direct and indirect questioning techniques. (¶6-4)
DF	direction finding
DHS	Defense HUMINT Service
DIA	Defense Intelligence Agency
DIAC	Defense Intelligence Analysis Center
DIMHRS	Defense Integrated Management Human Resource System
DIO	Defensive Information Operations
DISCOM	Division Support Command
DISUM	daily intelligence summary
DLPT	Defense Language Proficiency Test
DMS	Director of Military Support
DOCEX	document exploitation
***document exploitation**	The systematic extraction of information from all media formats in response to collection requirements. (¶6-4)
DOD	Department of Defense
DOJ	Department of Justice
DOT	Department of Transportation
DP	decision point
DPM	dissemination program manager
DS	direct support
DSM	decision support matrix
DST	decision support template
EA	electronic attack
EAC	echelons above corps
ECOA	enemy course of action
EEFI	essential elements of friendly information
ELINT	electronic intelligence
EM	electromagnetic
eMILPO	electronic Military Personnel Office System
EMS	electromagnetic spectrum
E-O	electro-optical
EOB	electronic order of battle
EOD	explosive ordinance disposal

EP	electronic protection
EPW	enemy prisoner of war
ES	electronic warfare support (Army)
***evaluating**	**1.** Comparing relevant information (RI) on the situation or operation against criteria to determine success or progress. (FM 6-0) **2.** In intelligence usage, appraisal of an item of information in terms of credibility, reliability, pertinence, and accuracy. (FM 2-0) (¶1-26 and 1-98)
EW	electronic warfare
EWS	electronic warfare support (joint)
FBI	Federal Bureau of Investigation
FDA	functional damage assessment
FDU	Force Design Update
FEMA	Federal Emergency Management Agency
FFIR	friendly force information requirement
FISINT	foreign instrumentation signals intelligence
FISS	Foreign Intelligence Security Service
FLPP	Foreign Language Proficiency Pay
FM	Field Manual
FMA	foreign materiel acquisition
FME	foreign materiel exploitation
FMEP	Foreign Materiel Exploitation Program
FMP	Foreign Materiel Program
FMT	Foreign Materiel for Training
FP	force protection
FRAGO	fragmentary order
FS	fire support
FSAC	Fire Support Armaments Center
FSE	fire support element
FSO	fire support officer
G1	Assistant Chief of Staff, Personnel
G2	Assistant Chief of Staff, Intelligence
G3	Assistant Chief of Staff, Operations
G4	Assistant Chief of Staff, Logistics
G5	Assistant Chief of Staff, Civil/Military Affairs

G6	Assistant Chief of Staff, Command, Control, Communications, and Computer Operations
G7	Assistant Chief of Staff, Information Operations
GMI	general military intelligence
GPS	Global Positioning System
GS	general support
GS-R	general support-reinforcing
HN	host nation
HOC	HUMINT operations cell
HPT	high-payoff target
HQ	headquarters
HQDA	Headquarters, Department of the Army
HSI	hyperspectral imaging
HUMINT	human intelligence
***human intelligence**	Collection by a trained HUMINT collector of foreign information from people and multimedia to identify elements, intentions, composition, strength, dispositions, tactics, equipment, personnel, and capabilities. It uses human sources and a variety of collection methods, both passively and actively, to gather information to satisfy the commander's intelligence requirements and cross-cue other intelligence disciplines. (¶1-106 and ¶6-1)
HVT	high-value target
I/R	internment and resettlement (operations)
I&W	indications and warnings
ICC	Intelligence Coordination Center (US Coast Guard)
ICF	intelligence contingency fund
ICL	intelligence coordination line
IDC	Information Dominance Center
IIR	intelligence information report
IM	information management
IMA	individual mobilization augmentee
IMEP	International Materiel Evaluation Program
IMETS	Integrated Meteorological System
IMINT	imagery intelligence
***indications and warning**	(joint) Those intelligence activities intended to detect and report time-sensitive intelligence information on foreign developments that could involve a threat to the United States or

allied and/or coalition military, political, or economic interests or to US citizens abroad. It includes forewarning of enemy actions or intentions; the imminence of hostilities; insurgency; nuclear or non-nuclear attack on the United States, its overseas forces, or allied and/or coalition nations; hostile reactions to US reconnaissance activities; terrorists attacks; and other similar events. (¶2-19)

***indicator** (Army) Positive or negative evidence of threat activity or any characteristic of the AO which points toward threat vulnerabilities or the adoption or rejection by the threat of a particular capability, or which may influence the commander's selection of a COA. Indicators may result from previous actions or from threat failure to take action. (FM 2-0) (¶5-14)

INFOSEC information security

***infrastructure** **1.** (joint) All building and permanent installations necessary for support, redeployment, and military forces operations (e.g., barracks, headquarters, airfields, communications facilities, stores, port installations, and maintenance stations). (JP 4-01.8) **2.** (Army) In intelligence usage, the basic underlying framework or feature of a thing; in economics, basic resources, communications, industries, and so forth, upon which others depend; in insurgency, the organization (usually hidden) of insurgent leadership. (FM 2-0) (¶5-8)

INR Bureau of Intelligence and Research, Department of State

INS Immigration and Naturalization Service

INSCOM US Army Intelligence and Security Command

intelligence **1.** (joint) The product resulting from the collection, processing, integration, analysis, evaluation, and interpretation of available information concerning foreign countries or areas. **2.** Information and knowledge about an adversary obtained through observation, investigation, analysis, or understanding. (¶1-3)

***intelligence coordination line** A line that designates the boundary between AOIRs. The G2/S2 establishes ICLs to facilitate coordination between higher, lateral, and subordinate units; coordinates with the G3/S3 to direct subordinates to track enemy units and HPTs in their areas; and hands over intelligence responsibility for areas of the battlefield. The establishment of ICLs ensures that there are no gaps in the collection effort; that all echelons are aware of the location, mission, and capabilities of other assets; facilitates asset cueing, and provides timely exchange of information between assets. The G2/S2 keeps abreast of collection activities in progress (all echelons) and battlefield developments through the ICLs. (¶3-13)

intelligence discipline (joint) A well-defined area of intelligence collection, processing, exploitation, and reporting using a specific category of technical or human resources. There are seven major disciplines: human

intelligence, imagery intelligence, measurement and signature intelligence, signals intelligence (communications intelligence, electronic intelligence, and foreign instrumentation signals intelligence), all-source intelligence, technical intelligence, and counterintelligence. (¶1-104)

***intelligence process** — A theoretical model used to describe intelligence operations. The intelligence process is not a framework for actual operations because the functions and common tasks occur in parallel as opposed to sequentially. (¶1-91)

***intelligence products** — Intelligence products are generally placed in one of six categories: I&W, current, general military, target, S&T, and CI. The categories are distinguished from each other primarily by the purpose for which the intelligence was produced. The categories often overlap, and the same intelligence data can be used in each of the categories. (¶1-5)

INTREP — intelligence report

INTSUM — intelligence summary

***intelligence requirements** — (Army) Those requirements generated from the staff's IRs regarding the enemy and environment that are not a part of the CCIR (PIR and FFIR). Intelligence requirements require collection and can pro-vide answers in order to identify indicators of enemy actions or intent, which reduce the uncertainties associated with an operation. Significant changes (i.e., branches and sequels) with an operation usually lead to changes in intelligence requirements. (¶2-7)

***intelligence running estimate** — The intelligence running estimate is a continuous flow and presentation of relevant information and predictive intelligence that, when combined with the other staff running estimates, enable the decisionmaker's visualization and situational understanding of the AOI in order to achieve information superiority. The intelligence running estimate requires constant verification to support situational understanding of the current situation as well as predictive assessments for future operations. (¶5-30)

***intelligence synchronization** — The task that ensures ISR operations are linked to the commander's requirements and respond in time to influence decisions and operations. The intelligence officer, with staff participation, synchronizes the entire collection effort to include all assets the commander controls, assets of lateral units and higher echelons units and organizations, and intelligence reach to answer the commander's CCIR (PIR and FFIR). (¶1-24)

***intelligence synchronization plan** — The plan the intelligence officer uses, with staff input, to synchronize the entire collection effort to include all assets the commander controls, assets of lateral units, and higher echelon units and organizations, and intelligence reach to answer the commander's CCIR (PIR and FFIR). (¶1-38)

IO — information operations

IPB	intelligence preparation of the battlefield
IPIR	Initial Phase Imagery Report
IPTF	international police task force
IR	information requirement
IRINT	infrared intelligence
IRR	Individual Ready Reserve
ISM	intelligence synchronization matrix
ISR	intelligence, surveillance, and reconnaissance
J2	Joint Staff Directorate, Intelligence
J2A	Joint Staff Directorate, Intelligence (Administrative)
J2J	Joint Staff Directorate, Intelligence (Joint)
J2M	Joint Staff Directorate, Intelligence (Management)
J2O	Joint Staff Directorate, Intelligence (Operations)
J2P	Joint Staff Directorate, Intelligence (Assessments, Doctrine)
J2T	Joint Staff Directorate, Intelligence (Targeting)
J2X	Joint Staff Directorate, Intelligence (CI & HUMINT)
J3	Joint Staff Directorate, Operations
J5	Joint Staff Directorate, Civil Affairs

LEA	law enforcement agency
LIDAR	laser radar
LN	local national
LNO	liaison officer
LOC	line of communication
LOS	line of sight
LPT	logistics preparation of the theater
LTIOV	latest time information is of value
MACOM	major Army command
MASINT	measurement and signature intelligence
***materiel**	(Army) In intelligence usage, the all-encompassing term for the weapons systems, equipment, apparatus, documents, and supplies of a foreign military force or nonmilitary organization. (¶2-24)
MCIA	Marine Corps Intelligence Agency
MCOO	modified combined obstacle overlay
MCS	Maneuver Control System
MDMP	military decisionmaking process
MEA	munitions effects assessment
METL	mission-essential task list
METT-TC	mission, enemy, terrain and weather, troops and support available, time available, civil considerations
MI	military intelligence
MLT	machine language translation
MNFC	multinational force commander
MO	method of operation
MOPP	mission-oriented protective posture
MOS	military occupational specialty
MP	military police
MSC	major subordinate command
MSE	mobile subscriber equipment

MSI	multi-spectral imagery
MSIC	Missile and Space Intelligence Center
MTI	moving target indicator
MTOE	modified table of organization and equipment
MTW	major theater war
NAI	named area of interest
NAIC	National Air Intelligence Center
NATO	North Atlantic Treaty Organization
NBC	nuclear, biological, and chemical
NCA	National Command Authorities
NCO	noncommissioned officer
NCR	national cryptologic representative
NCTI	non-cooperative target identification
NEO	noncombatant evacuation operation
NFH	National Defense Headquarters, Canada
NGA	National Geospatial-Intelligence Agency
NGO	non-governmental organization
NIC	National Intelligence Center
NIIRS	National Imagery Interpretability Rating Scale
NIMA	National Imagery and Mapping Agency
NIST	National Intelligence Support Team
NLT	not later than
NMCC	National Military Command
NMIC	National Maritime Intelligence Center
NMJIC	National Military Joint Intelligence Center
NRO	National Reconnaissance Office
NRT	near-real time
NSA	National Security Agency
NSC	National Security Council
NUCINT	Nuclear Intelligence
NVD	night vision device
OB	order of battle
OE	operational environment
OMA	Office of Military Affairs

OMB	Office of Management and Budget
OMT	operational management team
ONDCP	Office of National Drug Control Policy
ONI	Office of Naval Intelligence
ONIR	overhead non-imaging infrared
OPCON	operational control
OPLAN	operation plan
OPORD	operation order
OPSEC	operations security
OSC	operations support cell
OSCE	Organization for Security and Cooperation in Europe
OSD	Office of the Secretary of Defense
OSINT	open-source intelligence
PAO	Public Affairs Office
PDA	physical damage assessment
PIAP	Police Information Assessment Program
PIO	police intelligence operations
PIR	priority intelligence requirement
PME	peacetime military engagement
POC	point of contact
POD	port of debarkation
POE	port of embarkation
***predictive intelligence**	Intelligence analysis conclusions, assessments or products that attempt to define, describe, present, or portray the future situation or condition of the enemy or battlespace. (¶1-3)
***priority intelligence requirements**	(joint) Those intelligence requirements for which a commander has an anticipated and stated priority in his task of planning and decision-making. (FM 2-0) (¶1-32)
***process/ processing**	A function of the intelligence process that involves converting collected data, which is not already in a comprehensible form when it is reported, into a form that is understandable and suitable for analysis and production of intelligence. Examples of processing include developing film, enhancing imagery, translating a document from a foreign language, converting electronic data into a standardized report that can be analyzed by a system operator, and correlating dissimilar or jumbled information by assembling like elements before the information is forwarded for analysis. (FM 2-0) (¶1-96)

***production**	In intelligence usage, conversion of information into intelligence through the integration, analysis, evaluation, and interpretation of all source data and the preparation of intelligence products in support of known or anticipated user requirements. (¶4-20)
PSYOP	psychological operations
QRC	quick reaction capability
QRF	quick reaction force
R&D	research and development
RADINT	radar intelligence
RC	reserve component
RDEC	Research, Development, and Engineering Center
REMBASS	Remotely Monitored Battlefield Sensor System
***requirements management**	The intelligence task that develops a prioritized list of what information needs to be collected and produced into intelligence, dynamically updates and adjusts those requirements in response to mission adjustments/changes, and places a latest time intelligence is of value to ensure intelligence and information is reported to meet operational requirements. (¶2-83)
RF	radio frequency
RFI	request for information
RFW	radio frequency weapon
RI	relevant information
RM	requirements management
ROE	rules of engagement
ROK	Republic of Korea
ROZ	restricted operating zone
RSO&I	reception, staging, onward movement, and integration
RSOC	Regional Security Operations Center
RSP	render safe procedure
RTCAE	Regional Technical Control and Analysis Element
running estimate	A staff estimate, continuously updated, based on new information as the operation proceeds. (FM 6-0) (¶5-28)
S&T	scientific and technical
S&TI	scientific and technical intelligence
S1	Staff Officer, Personnel
S2	Staff Officer, Intelligence
S2X	Staff Officer, Intelligence (CI & HUMINT)

S3	Staff Officer, Operations
S4	Staff Officer, Logistics
S5	Staff Officer, Civil Affairs
S6	Staff Officer, Command, Control, Communications, and Computer Operations
SAP	special access program
SAR	synthetic aperture radar
SATCOM	satellite communications
SBCCOM	Chemical and Biological Defense Command
SCI	sensitive compartmented information
SCIF	sensitive compartmented information facility
SIDPERS	Standard Installation Division Personnel System
SIGINT	signals intelligence
SIGO	signal officer
SII	statement of intelligence interest
SIO	senior intelligence officer
SIPRNET	Secret Internet Protocol Router Network
SIR	specific information requirement
SITMAP	situation map
***situation template**	(Army) A depiction of a potential adversary course of action as part of a particular adversary operation. Situation templates are developed on the adversary's current situation (for example, training and experience levels, logistic status, losses, and disposition), the environment, and adversary doctrine or patterns of operations. The commander dictates the level to depict the adversary based on the factors of METT-TC (at minimum two levels of command below the friendly force) as a part of his guidance for mission analysis. (FM 2-0) (¶1-58)
SJA	staff judge advocate
SMU	special mission unit
SOCOM	satellite communications on-the-move
SOF	special operations forces
SOFA	status of forces agreement
SOP	standing operating procedure
SOTA	SIGINT operational tasking authority
SR	special reconnaissance
SRTD	signals research and target development

SSO	special security office
STANAG	standardization agreement (NATO)
STICEUR	Scientific and Technology Intelligence Center Europe
SUPR	supplemental imagery report
SWO	staff weather officer
TA	target acquisition
TACON	tactical control
***tactical questioning**	The expedient initial questioning for information of immediate tactical value. (FM 2-0) (¶6-6)
TAI	target area of interest
TCAE	technical control and analysis element
TCN	third-country national
***technical control**	The technical function to ensure adherence to existing policies or regulations and provide technical guidance for MI activities, particularly HUMINT, SIGINT, and CI operations. (FM 2-0) (¶3-23)
TECHINT	technical intelligence
TECOM	Test and Evaluation Command
TENCAP	Tactical Exploitation of National Capabilities
TEU	Technical Escort Unit
THREATCON	threat condition
TIB	Theater Intelligence Brigade
TIG	Theater Intelligence Group
TIM	toxic industrial material
TLP	troop-leading procedure
TOC	tactical operations center
TPFDD	Time Phased Force Deployment Data
TRADOC	US Army Training and Doctrine Command
TSA	target system assessment
TSCM	Technical Surveillance Countermeasures
TSE	theater support element
TTP	tactics, techniques, and procedures
TVA	threat vulnerability assessment
UAV	unmanned aerial vehicle
UN	United Nations

US	United States
USAF	United States Air Force
USAR	United States Army Reserve
USC	United States Code
USCENTCOM	United States Central Command
USCG	United States Coast Guard
USCS	United States Cryptologic System
USEUCOM	United States European Command
USJFCOM	United States Joint Forces Command
USMC	United States Marine Corps
USNORTHCOM	United States Northern Command
USPACECOM	United States Space Command
USPACOM	United States Pacific Command
USSID	United States Signal Intelligence Directive
USSOCOM	United States Special Operations Command
USSOUTHCOM	United States Southern Command
USSPACECOM	United States Space Command
USSTRATCOM	United States Strategic Command
USTRANSCOM	United States Transportation Command
VJ2	Vice J2
VTC	video teleconference
WAN	wide area network
WARNO	warning order
WMD	weapons of mass destruction
WO	warrant officer

Bibliography

The bibliography lists field manuals published with new numbers followed by old number.

DOCUMENTS NEEDED

These documents must be available to the intended users of this publication.

JP 1-02. *Department of Defense Dictionary of Military and Associated Terms*. June 1999. [Online] Available http://www.dtic.mil/doctrine/jel/doddict/

FM 1-02/MCRP 5-2A. *Operational Terms and Symbols* (Drag Draft). 21 February 2003.

READINGS RECOMMENDED

These sources contain relevant supplemental information.

ARMY PUBLICATIONS

Most Army doctrinal publications are available online:
http://155.217.58.58/atdls.htm

AR 381-10. *US Army Intelligence Activities*. 1 July 1984.

AR 381-12. *Subversion and Espionage Directed Against the U.S. Army (SAEDA).* 15 January 1993.

AR 381-20. *The Army Counterintelligence Program*. 15 November 1993.

AR 611-6. *Army Linguist Management*. 16 February 1996.

AR 715-9. *Contractors Accompanying the Force*. 29 October 1999.

FM 1 (100-1). *The Army*. 14 June 2001.

FM 2-19.402. *STRYKER Brigade Combat Team Intelligence Operations*. 1 March 2003.

FM 2-19.602. *Surveillance Troop*. 1 March 2003.

FM 2-33.5/ST. *Intelligence Reach Operations*. 1 June 2001.

FM 3-0. *Operations*. 14 June 2001.

FM 3-05.102. *Army Special Operations Forces Intelligence*. 31 August 2001 (formerly FM 34-36).

FM 3-05.30. *Psychological Operations*. 19 June 2000.

FM 3-06.11. *Combined Arms Operations in Urban Terrain*. 28 February 2002.

FM 3-13. *Information Operations*. 28 November 2003 (formerly FM 100-6).

FM 3-19. *NBC Reconnaissance*. 19 November 1993.

FM 3-19.1. *Military Police Operations*. 22 March 2001.

FM 3-19.4. *Military Police Leaders' Handbook*. 4 March 2002.

FM 3-19.40. *Military Police Internment/Resettlement Operations*. 30 September 1987.

FM 3-20.98. *Reconnaissance Platoon*. May 2001.

FM 34-2. *Collection Management and Synchronization Planning*. 8 March 1994.

FM 34-52. (FM 2-22-3) *Human Intelligence*. 28 September 1992.

FM 3-90. *Tactics*. 4 July 2001.

FM 3-90.3. *The Mounted Brigade Combat Team*. 1 November 2001.

FM 3-100.4. *Environmental Considerations in Military Operations*. 15 June 2000, Change 1, 11 May 2001.

FM 3-100.21. *Contractors on the Battlefield*. 26 March 2000.

FM 5-170. *Engineer Reconnaissance*. 5 May 1998.

FM 6-0. *Mission Command: Command and Control of Army Forces*. 11 August 2003.

FM 6-20-10. *Tactics. Techniques, and Procedures for the Targeting Process*. 8 May 1996.

FM 6-121. *Tactics, Techniques, and Procedures for Field Artillery Target Acquisition*. 25 September 1990.

FM 7-0. *Training the Force*. 22 October 2002.

FM 7-10. *The Infantry Rifle Company*. 14 December 1990.

FM 7-15. *Army Universal Task List*. 31 August 2003.

FM 7-92. *The Infantry Reconnaissance Platoon and Squad (Airborne, Air Assault, Light Infantry)*. 23 December 1992.

FM 7-100. *Opposing Force Doctrinal Framework and Strategy*. 1 May 2003.

FM 17-97. *Cavalry Troop*. 3 October 1995.

FM 17-98. *Scout Platoon*. 10 April 1999.

FM 19-1. *Military Police Support for the Airland Battle*. 23 May 1988.

FM 27-10. *The Law of Land Warfare*. 18 July 1956.

FM 31-20-5. *Special Reconnaissance Tactics, Techniques, and Procedures for Special Forces*. 23 March 1993.

FM 34-2-1. *Tactics, Techniques, and Procedures for Reconnaissance and Surveillance and Intelligence to Counterreconnaissance*. 19 June 1991.

FM 34-3. *Intelligence Analysis*. 15 March 1990.

FM 34-8-2. *Intelligence Officer's Handbook*. 1 May 1998.

FM 34-10. *Division Intelligence and Electronic Warfare Operations*. 25 November 1986.

FM 34-25. *Corps Intelligence and Electronic Warfare Operations*. 30 September 1987.

FM 34-37. *Echelons Above Corps (EAC) Intelligence and Electronic Warfare (IEW) Operations*. 15 January 1991.

FM 34-54. *Technical Intelligence*. 30 January 1998.

FM 34-80. *Brigade and Battalion Intelligence and Electronic Warfare Operations*. 15 April 1986.

FM 34-130. *Intelligence Preparation of the Battlefield*. 8 July 1994.

FM 4-0. *Combat Service Support*. 29 August 2003.

FM 41-10. *Civil Affairs Operations*. 14 February 2000.

FM 100-25. *Doctrine for Army Special Operations Forces*. August 1999.

FM 101-5. *Staff Organization and Operations*. 31 May 1997.

FM 101-5-1. *Operational Terms and Graphics*. 30 September 1997.

FM 101-5-2. *US Army Report and Message Formats*. 29 June 1999.

ST 2-22.7. *Tactical Human Intelligence and Counterintelligence Operations*. April 2002.

ST 2-33.5. *Intelligence Reach Operations*. 1 June 2001.

ST 2-50. *Intelligence and Electronic Warfare Assets*. June 2002.

ST 2-50.4. *Combat Commanders' Handbook on Intelligence*. September 2001 (formerly FM 34-81, 28 September 1992).

JOINT PUBLICATIONS

Most joint publications are available online: http://www.dtic.mil/doctrine/jel/

JP 0-2. *Unified Action Armed Forces (UNAAF)*. 10 July 2001.

JP 1. *Joint Warfare for the US Armed Forces*. 14 November 2000.

JP 1-06. *Joint Tactics, Techniques, and Procedures for Financial Management During Joint Operations*. 22 December 1999.

JP 2-0. *Joint Doctrine for Intelligence to Operations*. January 2000.

JP 2-01. *Joint Intelligence Support to Military Operations*. 20 November 1996.

JP 2-01.1. *Joint Tactics, Techniques, and Procedures for Intelligence Support to Targeting*. 9 January 2003.

JP 2-01.3. *Joint Tactics, Techniques, and Procedures for Joint Intelligence Preparation of the Battlespace*, 24 May 2000.

JP 2-02. *National Intelligence to Joint Operations*. 28 September 1998.

JP 2-03. *Joint Tactics, Techniques, and Procedures for Geospatial Information and Services Support to Joint Operations*. 31 March 1999.

JP 3-0. *Doctrine and Joint Operations*. 1 February 1995.

JP 3-07. *Joint Doctrine for Military Operations Other Than War*. 16 June 1995.

JP 3-07.2. *JTTP for Antiterrorism*. 17 March 1998.

JP 3-08. *Interagency Coordination During Joint Operations,* Volume II. 9 October 1996.

JP 3-09. *Doctrine for Joint Fire Support*. 12 May 1998.

JP 3-09.1. *Joint Tactics, Techniques and Procedures for Laser Designation Operations*. 28 May 1999.

JP 3-11. *Joint Doctrine for Operations in Nuclear, Biological, and Chemical (NBC) Environments*. 11 July 2000.

JP 3-13. *Joint Doctrine for Information Operations*. 9 October 1998.

JP 3-18. *Joint Doctrine for Forcible Entry Operations*. 16 July 2001.

JP 3-35. *Joint Deployment and Redeployment Operations*. 7 September 1999.

JP 3-51. *Joint Doctrine for Electronic Warfare*. 7 April 2000.

JP 3-55. *Doctrine for Reconnaissance, Surveillance, and Target Acquisition Support for Joint Operations (RSTA)*. 14 April 1993.

JP 3-57. *Joint Doctrine for Civil-Military Operations*. 8 February 2001.

JP 3-60. *Joint Doctrine for Targeting*. 17 January 2002.

JP 4-0. *Doctrine for Logistic Support of Joint Operations*. 6 April 2000.

JP 5-0. *Doctrine for Planning Joint Operations*. 13 April 1995.

JP 5-00.2. *Joint Task Force Planning Guidance and Procedures*. 13 January 1999.

PUBLIC LAWS AND OTHER PUBLICATIONS

The United States Code is available online: http://uscode.house.gov/usc.htm

EO 12333. *United States Intelligence Activities*. 4 December 1981.

CJCS Instruction 1301.01, Policy and Procedures to Assign Individuals to Meet Combatant Command Mission-Related Temporary Duty Requirements. 1 July 2001.

CJCSM 3500.04C. *Universal Joint Task List*. 1 July 2002.

Military Standard 2525B, *DOD Interface Standard, Common Warfighting Symbology*. 30 January 1999.

PUBLICATIONS UNDER DEVELOPMENT

FM 2-01. *Intelligence Synchronization*. When published tentatively in July 2004, FM 2-01 will supersede FM 34-2, 8 March 1994, and FM 34-2-1, 19 June 1991.

FM 2-01.2. *Counterintelligence Analysis*. When published tentatively in April 2005, FM 2-01.2 will supersede FM 34-60, 3 October 1995.

FM 2-01.3. *Intelligence Preparation of the Battlefield*. When published tentatively December 2004, FM 2-01.3 will supersede FM 34-130, 8 July 1994.

FM 3-07.2. *Force Protection.* To be published tentatively in August 2005.

FM 5-0. *Army Planning and Orders Production*. When published tentatively in November 2004, FM 5-0 will supersede that portion of FM 101-5 not superseded by FM 6-0.

ST 2-91.6. *Small Unit Support to Intelligence*. To be published tentatively in April 2004.

To Our Readers

Changes: Readers of this publication are encouraged to submit suggestions and changes that will improve it. Recommendations may be sent directly to Commanding General, Marine Corps Combat Development Command, Doctrine Division (C 42), 3300 Russell Road, Suite 318A, Quantico, VA 22134-5021 or by fax to 703-784-2917 (DSN 278-2917) or by E-mail to **morgann@mccdc.usmc.mil**. Recommendations should include the following information:

- Location of change
  - Publication number and title
  - Current page number
  - Paragraph number (if applicable)
  - Line number
  - Figure or table number (if applicable)
- Nature of change
  - Add, delete
  - Proposed new text, preferably double-spaced and typewritten
- Justification and/or source of change

Additional copies: A printed copy of this publication may be obtained from Marine Corps Logistics Base, Albany, GA 31704-5001, by following the instructions in MCBul 5600, *Marine Corps Doctrinal Publications Status.* An electronic copy may be obtained from the Doctrine Division, MCCDC, world wide web home page which is found at the following universal reference locator: **http://www.doctrine.usmc.mil**.

Unless otherwise stated, whenever the masculine gender is used, both men and women are included.

FOREWORD

Marine Corps Warfighting Publication (MCWP) 2-1, *Intelligence Operations*, builds on the doctrinal foundation established in Marine Corps Doctrinal Publication (MCDP) 2, *Intelligence*. It provides tactics, techniques, and procedures (TTP) for Marine air-ground task force (MAGTF) intelligence operations. This publication is intended for commanders, other users of intelligence, and intelligence personnel who plan and execute intelligence operations.

This publication supersedes MCWP 2-1, *Intelligence Operations,* dated 19 February 1998.

Reviewed and approved this date.

CHAPTER 1
FUNDAMENTALS

Intelligence is knowledge of the battlespace and of the threat forces in that battlespace. Knowledge is generated in support of the commander's decisionmaking process and is the result of the collection, processing, exploitation, evaluation, integration, analysis, and interpretation of available information about the battlespace and threat.

Intelligence Objectives

Intelligence has two objectives: to reduce uncertainty by providing accurate, timely, and relevant knowledge about the threat and the surrounding environment, and to assist in protecting friendly forces (to include Department of Defense [DOD] personnel, family members, resources, facilities and critical information) through counterintelligence (CI).

Uncertainty pervades the battlespace—it is a fundamental attribute of war. First and foremost, intelligence should support the commander's decisionmaking process by reducing uncertainty about the hostile situation. Intelligence should accomplish the following actions to achieve this objective:

- Identify and evaluate existing conditions and capabilities.
- On the basis of those existing conditions and capabilities, estimate possible enemy courses of action (COAs) and provide insight into possible future actions.
- Aid in identifying friendly critical vulnerabilities that the threat may exploit.
- Assist in developing and evaluating friendly COAs.

The fog and friction of war will never allow the commander to have a perfect picture of the battlespace. Because intelligence deals with the greatest number of unknowns—questions about an unfamiliar area and a hostile enemy who is actively trying to conceal information about his forces and intentions—there will almost always be gaps in intelligence, and the knowledge provided will lack the desired degree of detail and reliability. Intelligence cannot provide absolute certainty. It attempts to reduce the uncertainty facing the commander to a reasonable level by collecting relevant information, placing it in context to provide knowledge, and conveying it in the form of images to enhance understanding.

CI is information gathered and activities conducted to protect against espionage, other intelligence activities, sabotage or assassinations conducted by or on behalf of foreign governments or elements thereof, foreign organizations, foreign persons or international terrorist activities.

CI activities consist of active and passive measures, functions, and services. CI measures, functions, and services are intended to deny a potential adversary information that might increase the effectiveness of hostile operations against friendly forces; detect and neutralize foreign intelligence collection; and deceive the enemy as to friendly capabilities and intentions. In so doing, CI increases uncertainty for the enemy, thereby making a significant contribution to the success of operations. CI services identify friendly vulnerabilities, evaluate security measures, and assist in implementing appropriate plans to enhance a unit's force protection posture against the threats of sabotage, subversion, and terrorism.

Maneuver Warfare

The essence of war is a violent clash between independent wills, each trying to impose itself on the other. War's defining attributes of friction, uncertainty, fluidity, disorder, and complexity combine with the various dimensions of human nature to make war a fundamentally unpredictable activity. To succeed in war, Marines must be able to operate effectively in this uncertain, chaotic, complex, and fluid environment.

The Marine Corps philosophy for winning under these conditions is based on rapid, flexible, and opportune maneuver. MCDP 1, *Warfighting*, states that, "Maneuver warfare is a warfighting philosophy that seeks to shatter the enemy's cohesion through a variety of rapid, focused, and unexpected actions which create a turbulent and rapidly deteriorating situation with which the enemy cannot cope." Maneuver warfare requires maneuver in time and space to achieve superiority over the enemy. It concentrates on those actions that present the enemy with a series of dilemmas where events happen unexpectedly and faster than the enemy can react. Concepts central to executing maneuver warfare follow:

- **Orienting on the enemy.** Maneuver warfare attacks the enemy "system," the combination of physical, moral, and mental components that make up an enemy or an enemy force. This means focusing outward on the particular characteristics of the enemy.
- **Centers of gravity (COG) and critical vulnerabilities.** COG are sources of moral or physical strength, power or resistance that are critical to the enemy's ability to resist. Critical vulnerabilities are components of the enemy system that are both crucial to the functioning of the system and vulnerable to exploitation. Identifying and exploiting an enemy's COG and critical vulnerabilities help focus combat power toward a decisive aim.
- **Main effort.** The main effort is the unit assigned responsibility to accomplish the key mission within the command. It is directed where there is the best opportunity to succeed and at the objective that will have the most significant effect on the enemy, normally a critical vulnerability.
- **Commander's intent.** Commander's intent describes the purpose behind the task assigned in a mission. It provides continuing guidance when the tactical situation changes and permits the exercise of initiative in harmony with the commander's desires.
- **Mission tactics.** Mission tactics assign subordinates a task without specifying how it must be accomplished. They permit subordinates to exercise initiative in adapting to ever-changing situations.
- **Tempo.** Tempo keeps the enemy off balance, thereby increasing his friction. Speed, initiative, and flexibility generate and maintain a tempo that the enemy cannot match.

Accurate and timely intelligence is a prerequisite for success in maneuver warfare. Maneuver warfare is based on a firm focus on the enemy and on taking action that avoids enemy strengths and exploits enemy critical vulnerabilities. It means acting in a manner and at a time and place that the enemy does not expect and is not prepared. It requires decision and action based on situational awareness—a keen understanding of the factors that make each situation unique. Intelligence provides the knowledge of the enemy and the battlespace that permits the commander to reduce uncertainty, identify opportunities for success, assess risk, outline intent, and make decisions that provide focus, generate speed and tempo, and achieve decisive results.

Developing Intelligence

Data, Information, and Intelligence

Intelligence is not simply another term for information. Intelligence is more than an element of

data or a grouping of information; it is a body of knowledge. Knowledge occupies a unique place in the information hierarchy, which is a framework to distinguish between various classes of information. (See figure 1-1.)

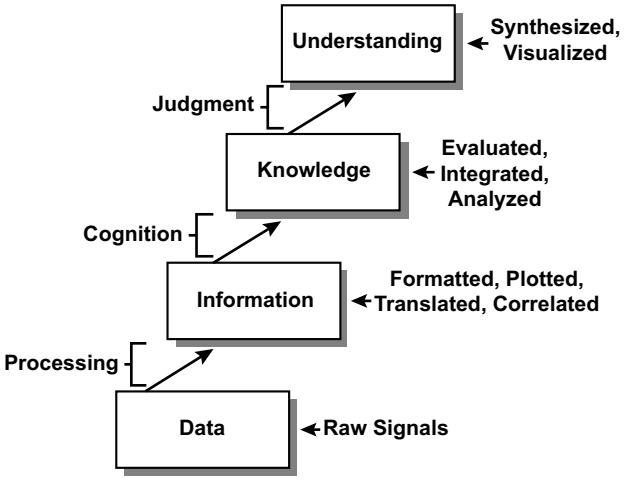

Figure 1-1. The Information Hierarchy.

There is a clear and important distinction between raw data, information, and intelligence. Intelligence is not a mass of unfocused data or even a collection of related facts. In fact, giving a commander every piece of data without providing meaning can increase uncertainty by overloading the commander with incomplete, contradictory or irrelevant information. To be intelligence, data must be placed in context to provide an accurate and meaningful image of the hostile situation. Intelligence is developed by analyzing and synthesizing data and information to produce knowledge about the threat and the environment. The commander combines this knowledge with knowledge of the friendly situation and employs experience, judgment, and intuition to understand the situation. The commander then applies this understanding in making decisions.

The Intelligence Cycle

Intelligence is the output of a process that converts data and information into knowledge that applies to a specific military decision. The process used to develop intelligence is called the intelligence cycle. This cycle is the process by which information is planned for, obtained, assembled, converted through analysis into intelligence, provided to decisionmakers, and, ultimately, used in making decisions. (See figure 1-2.)

Intelligence Cycle	Key Considerations
Planning and direction.	Identify intelligence requirements. Plan intelligence operations and activities. Support the formulation of the commander's estimate of the situation.
Collection.	Develop the required intelligence structure. Use organic, attached, and supporting intelligence sources to collect intelligence.
Processing, exploitation, and production.	Conversion of raw data and information into a suitable form of intelligence.
Dissemination.	Timely provision of intelligence, in appropriate form, to those who need it.
Utilization.	Use of intelligence.

Figure 1-2. Key Considerations of the Intelligence Cycle.

The intelligence cycle consists of a series of related activities that translate the need for intelligence about a particular aspect of the battlespace or threat into a knowledge-based product that is provided to the commander for use in the decisionmaking process. In this sequence, intelligence needs are identified and a plan is developed for satisfying those needs. Data are collected, processed into information, and converted into intelligence through analysis and synthesis. The resulting knowledge is then provided to the commander as an intelligence product that is used in making decisions. The information used to produce intelligence is derived from a variety of sources. Intelligence information; i.e., information used to generate intelligence, is commonly drawn from three types of data: intelligence, sensor or combat.

Intelligence data is derived from assets primarily dedicated to intelligence collection; e.g., imagery systems, electronic intercept equipment or human intelligence (HUMINT) sources.

Sensor data is derived from sensors whose primary mission is surveillance or target acquisition; e.g., air surveillance radars, counterbattery radars, and remote ground sensors.

Combat data is derived from reporting by operational units. Because of their highly perishable or critical nature, combat data and sensor data are sometimes used to effect decisions without being converted into intelligence. Although the demands of the ongoing battle may require rapid action, decisions based on raw, unprocessed data or single pieces of data should be avoided.

Processing, analysis, and synthesis of data and information into intelligence can be accomplished rapidly at all levels. We seek knowledge—*accurate intelligence, not incomplete, unfocused, or unevaluated information*—to enhance our understanding and base our decisions. The intelligence cycle works continuously to satisfy intelligence shortfalls and confirm or refute fragmentary information. Once collected and processed, information is converted into intelligence through the application of experience and judgment. Information is analyzed to determine its significance and is synthesized with other relevant information to build a coherent picture of existing conditions and capabilities. This picture is then used to predict possible outcomes of environmental conditions and enemy actions. Results are conveyed to the commander in an intelligence product. Because humans understand situations best as images—mental pictures—intelligence is produced and disseminated in graphic form whenever possible. The process is completed when the knowledge provided is applied to influence decisionmaking.

Intelligence Operations

Intelligence personnel and organizations perform a number of separate and distinct activities and functions that are collectively known as intelligence operations. Intelligence operations are conducted to provide intelligence in support of the decisionmaking process of commanders down to the small-unit level. The primary focus of Marine Corps intelligence operations is generating *tactical intelligence*; i.e., intelligence that supports the planning and conduct of tactical actions. Although the focus is on tactical intelligence, the Marine Corps must draw on both strategic and operational intelligence resources and, in certain circumstances, be prepared to conduct intelligence operations at the operational and even strategic level. Intelligence reduces uncertainty and supports the decisionmaking process by—

- Describing the battlespace.
- Identifying key factors in the battlespace that can influence operations.
- Defining and evaluating threat capabilities.
- Identifying the enemy's COG and critical vulnerabilities.
- Assessing enemy intentions.

Relationship to Command and Control

Intelligence is a fundamental component of command and control (C2). C2 is the means by which a commander recognizes what needs to be done and sees to it that appropriate actions are taken. A principal aim of C2 is to enhance the commander's ability to make sound and timely decisions. Intelligence facilitates the commander's decisionmaking process by making a major contribution to the understanding of the battlespace and the threat. Intelligence is also an

integral element of the process through which the commander implements decisions. Inadequate or imperfect intelligence can significantly inhibit the ability of a commander or subordinates to carry out these decisions. Lack of a continuous, effective intelligence effort also degrades the quality of feedback to the commander about the unfolding situation; it is this feedback that allows the commander to modify the actions of the command as needed.

Because intelligence is crucial to success on the battlefield, it must be given command attention. The commander drives intelligence by focusing the intelligence effort through the definition of the mission, articulation of his intent, and designating priority intelligence requirements (PIRs). A PIR is an intelligence requirement (IR) associated with a decision that will critically affect the overall success of the command's mission. PIRs are a subset of commander's critical information requirements (CCIRs) and are focused on the environment and the threat.

Relationship to Operations

Intelligence is inseparable from operations. Intelligence drives operations by shaping the planning and execution of operations. It provides a menu of factors that the commander considers when making a decision. Specifically, intelligence—

- Identifies potential advantages offered by the environment.
- Describes limitations imposed by the environment.
- Ascertains and assesses enemy strengths to be avoided.
- Uncovers enemy critical vulnerabilities that can be exploited.
- Recommends COAs based on factors of the battlespace and threat.
- Enables rapid decisionmaking and generating and maintaining tempo.

Operational actions develop logically from intelligence. A commander with effective intelligence knows the nature of the terrain, weather conditions, the composition and status of the infrastructure in the area of operations, the makeup and attitude of the population that will be encountered, and how the combined effects of these factors will influence mission accomplishment. Intelligence provides knowledge of threat capabilities, strengths, COG, and critical vulnerabilities, along with insight into the enemy's intentions. Integrating intelligence on the threat and the battlespace helps to provide the commander with situational awareness, which is used to determine the decisive time and place to strike.

Intelligence and operations must be linked throughout the planning, decision, execution, and assessment (PDE&A) cycle at all levels. Intelligence shapes the plan and provides the knowledge that facilitates execution. It identifies changes in the situation that require modification of the plan or that trigger decisions during the conduct of the operation. At the same time, the nature of the mission and the concept of operations focus and shape the intelligence effort; intelligence that is not relevant to the mission is useless. IRs and intelligence operations are continually evaluated to ensure that they are focused on supporting mission accomplishment.

Principles of Intelligence Operations

- **The focus is on tactical intelligence.** The focus of Marine Corps intelligence operations is on the generation of tactical intelligence. However, there are no sharp boundaries between levels of intelligence; they merge and form a continuum. In some instances Marine Corps tactical intelligence operations will support operational and strategic IRs.
- **Intelligence is focused downward.** Intelligence must be available to commanders at all

levels. Although the management of intelligence collection and production is centralized in the MAGTF command element (CE), the focus is on providing the intelligence needed to plan and execute the mission to every unit involved in the operation. Requirements of the entire force will be considered in directing the intelligence effort. Critical products will be *pushed* down to the tactical commander, who will be able to *pull* additional intelligence support as needed.

- **Intelligence drives operations.** The Marine Corps' warfighting philosophy depends on timely, accurate intelligence for success. Intelligence is the critical underpinning for each phase of the PDE&A cycle.
- **Intelligence activities require centralized management.** Good intelligence is the result of the integration of many separate and specialized collection, processing, and analytical resources. The scarcity of these assets, coupled with the requirement to focus on the commander's PIRs, creates the need for centralized coordination and management. This centralization will be done in the MAGTF CE, under the direction of intelligence officers who are trained and experienced in the management of multidiscipline, all-source intelligence operations. (All-source intelligence is intelligence that incorporates all available sources of information in the development of the finished intelligence product.) *Although centralized coordination and management is required for efficient and effective use of intelligence assets, it is critical for the commander who is exercising centralized control to allocate appropriate resources to ensure that needs of subordinate commands that are crucial to mission accomplishment are properly addressed.*
- **The G-2/S-2 facilitates use of intelligence.** The intelligence officer enables effective use of intelligence throughout the command. As the principal disseminator of intelligence, the intelligence officer ensures that the full implications of the intelligence picture are understood. To do this, the intelligence officer must be a *full and continuous* participant in the planning process.
- **Intelligence must be tailored and timely.** Intelligence must be tailored to the requirements of the user, provided in a useful format, and received in time to affect the decisionmaking process. Delivery of the right intelligence—not simply data or information—to the right place at the right time must be the guiding principle of all dissemination efforts.
- **Utilization is the final step of the intelligence cycle.** Intelligence has no inherent value; its value is derived from its support of decisionmaking. The intelligence cycle is not complete until the intelligence that has been developed is used to plan and/or execute operations.

Intelligence Functions

All six functions are carried out continually during the PDE&A cycle at all levels throughout the force. However, particular functions may be stressed more during one phase of the cycle. Different units may emphasize one or two functions over the others based on individual missions. (See figure 1-3.)

Support the Commander's Estimate

Intelligence supports the formulation and subsequent modification of the commander's estimate of the situation by providing as accurate an image of the battlespace and the threat as possible. Intelligence supports initial planning and decisionmaking. One of the principal tools used in this function is intelligence preparation of the battlespace (IPB). IPB is a systematic, continuous process of analyzing the threat and environment in a specific geographic area. IPB helps to provide an appreciation for the characteristics of the area of operations and the enemy capabilities, weaknesses, and COAs. This knowledge affords the commander an understanding of the battlespace and the opportunity to exploit enemy critical vulnerabilities.

Intelligence Functions	Decisionmaking	Operational Activities
Support to commander's estimate.	Plan a mission.	Develop and analyze COAs.
Situation development.	Execute the mission.	Monitor execution. Modify plan as necessary.
Indications and warning.	Orient on contingencies.	Increase readiness. Develop contingency plans.
Support to force protection.	Force protection.	Support operations security (OPSEC). Nuclear, chemical, and biological defense. Support deception plan.
Support to targeting.	Plan fire support.	Attack targets.
Support to combat assessment.	Reorient forces. Plan future operations.	Consolidate, pursue, exploit. Reattack targets.

Figure 1-3. Relationship Between Intelligence Functions and Operations.

Develop the Situation

Situation development provides continuing knowledge of unfolding events to help update the estimate of the situation. It is a dynamic process that assesses the current situation and confirms or denies the adoption of specific COAs by the enemy. It helps refine our understanding of the battlespace and reduces uncertainty and risk. Situation development occurs during execution and provides the basis for adapting plans or exploiting opportunities.

Provide Indications and Warning

Indications and warning (I&W) serve a protective purpose, providing early warning of potential hostile action. They help prevent surprise and reduce risk from enemy actions that run counter to planning assumptions.

Support Force Protection

Force protection is the set of comprehensive security measures, collection activities, and operations that are undertaken to guard the force against the effects of enemy action. Intelligence supports force protection by identifying, locating, and countering foreign intelligence collection, sabotage, subversion, and terrorism capabilities. Support to force protection requires detailed and accurate assessments of threat force capabilities and intentions and facilitates efforts to deny the enemy the opportunity to take offensive action against our forces.

Support Targeting

Intelligence supports targeting by identifying target systems, critical nodes, and high-value and high-payoff targets as well as by providing the intelligence required to most effectively engage these targets.

Support Combat Assessment

Combat assessment is the process used to determine the overall effectiveness of military operations and identify requirements for future actions. Intelligence supports the entire combat assessment process and is directly responsible for battle damage assessment (BDA), which is one of the principal components of combat assessment. BDA is the timely and accurate estimate of the damage resulting from the application of military force. BDA estimates physical damage to a particular target, functional damage to that target, and the capability of the entire target system to continue its operations.

The Commander's Role in the Intelligence Process

Intelligence is an inherent and essential responsibility of command. Commanders must come to think of command and intelligence as inseparable, just as they commonly think of command and operations as inseparable. They must study and understand the theory and the practice of intelligence doctrine. They must be personally involved in the conduct of intelligence activities, and provide guidance, supervision, judgment, and authority to ensure a timely and useful product.

Focus the Intelligence Effort

The commander must provide the guidance and direction necessary for the effective conduct of intelligence activities. Intelligence assets will rarely be sufficient to satisfy every requirement. Thus, the intelligence effort must be focused on clearly articulated priorities that drive the concept of intelligence support and the collection, production, and dissemination efforts. The commander provides this focus through articulating the commander's intent, planning guidance, and the command's PIRs.

Participate in the Intelligence Process

Although the intelligence officer manages the intelligence effort for the commander, the commander is responsible for the results. Effective participation requires an understanding of the practical capabilities and limitations of intelligence personnel, equipment, procedures, and products. The commander should supervise the process, interjecting guidance and direction at key points to ensure that the process is responding to the commander's intent; e.g., the commander should define the scope of the IPB effort, identify the preferred intelligence product format, and establish priorities among subordinate commands' IRs.

Use Intelligence in Decisionmaking

Intelligence exists for the primary purpose of aiding the commander's decisionmaking process. Although the intelligence officer facilitates the use of intelligence throughout the command by providing timely dissemination of the intelligence product and ensuring that the meaning of the intelligence is understood, the commander makes the judgment of its operational impact. The commander makes a personal analysis of the intelligence product and arrives at the estimate of the situation that serves as the basis for the decision. This act is the responsibility of the commander and no one else.

Support the Intelligence Effort

Intelligence is a team effort. Good intelligence is the result of integrating many separate and specialized collection, processing, and analytical resources. Some of these resources are organic to the unit; many are provided by units or agencies outside the command. Intelligence operations by organic assets normally cannot succeed without support from throughout the command. Reconnaissance teams must be inserted, sensors implanted, and communications assets provided for dissemination. Timely and effective intelligence dissemination requires dedicating significant C2 assets. Once an operation begins, nearly every Marine will have the occasion to observe significant facts about the enemy and environment. All personnel should understand and carry out their responsibility to collect and report information. The commander must ensure that all members of the unit understand the importance placed on intelligence and the requirement to support the intelligence effort. External support must be requested and coordinated. The intelligence staff executes the procedures to obtain the required support, but does so in the name of the commander. When the command's support requirements go unsatisfied, the commander must intervene, lending command authority to obtain the support.

Evaluate the Results of Intelligence Activities

The commander must provide feedback to the intelligence support system. Feedback should identify where the intelligence provided met expectations and where and how it fell short. Key areas to evaluate include product content, presentation, timeliness, and overall usefulness. Meaningful evaluation of the intelligence effort provides the basis for its continual improvement.

Information Operations

Intelligence support is required to conduct information operations (IO). Specific intelligence is required for planning and deconfliction and for employing military disciplines available to achieve IO effects. Intelligence is inextricably linked to facilitating core and supporting IO disciplines in offensive or defensive postures. As a product, intelligence supports IO in the same manner provided to all operations. Planning for IO cannot be conducted without intelligence on adversary information and information systems, perceptions, and critical vulnerabilities in their C2 process. Each capability used in an IO context will have separate and continuous intelligence support requirements. The psychological profiles of adversary commanders and forces are themselves an important element within the overall assessment process.

Planning

Intelligence support to IO planning is conducted as part of the IPB process. One of the key outputs from IPB is an analysis of the desired objectives and/or end states of stakeholders. These desires are usually categorized relative to broad capability. The categories may be elements of national power such as politics, economics, military, and society. Capability analysis processes within IPB also provide detail on stakeholder capacity and intent to conduct or sustain defensive and offensive IO. Intelligence support will aim to define critical nodes and vulnerabilities within the adversary's information structure; these include the key personnel, equipment, procedures and protocols involved in the transfer of information required for successful C2. Such intelligence support will orient key aspects of the operation plan towards the systematic disruption of critical nodes and information bearers. Friendly force staff advice, linked to intelligence advice on adversary COAs and CI advice on the threats to security, provide the operations planning process with the background to decide the protective measures required for own nodes and information bearers. Accurate, timely, and directed intelligence provides the foundation that IO decisions are based.

Intelligence Preparation of the Battlespace

IPB is a continuous process used to develop a detailed knowledge of the adversary's use of information and information systems. Intelligence support for IO planning builds upon traditional IPB and provides the essential basis for planning IO through the following considerations:

- The adversary commander's freedom of action and the freedom of action allowed to subordinates (decisionmaking process). This includes adversary perceptions of the situation (political, social, and cultural influences) and developments.
- Adversary IO capability, intent, morale, and vulnerability to offensive IO.
- C2 aspects such as key personnel, target audiences, headquarters, communications nodes, databases or intelligence collection systems. C2 nodes that appear in more than one adversary COA should be highlighted for targeting.
- Technical knowledge of a wide array of information, C2, intelligence, and media systems.
- Assessments of friendly vulnerability to adversary IO.

IO-Related Force Protection

Knowledge of the threat—adversaries, their intent, and capabilities—is a key consideration in the risk

management process. CI and counterreconnaissance contribute directly to force protection by denying critical information to potential adversaries. Many IO IRs require significant lead-time to develop collection sources, access, and databases. Potential intelligence collection sources should be developed as early as possible; a clear statement of MAGTF IRs is essential. IO will require development of extensive intelligence analytical products to obtain a detailed knowledge of cultural factors, and adversary use of information and information systems.

The Role of Intelligence in IO is Continual

Changes in attitudes, actions, operating patterns, and enemy information systems must be detected, analyzed, and reported to ensure that IO continues to achieve the desired operational effect. Assessing ongoing IO activities is a crucial and extremely challenging responsibility of intelligence as targets must be monitored to determine the effectiveness of the IO efforts. To achieve complete synthesis, IO must be incorporated into the MAGTF's intelligence, BDA, and targeting cycles. The impact of many IO actions may be difficult to measure. Indicators of success or failure must be carefully crafted in advance. Since IO will often not produce the same directly observable effects used for traditional BDA, IO execution will challenge the intelligence system to develop other measures of effectiveness. Once detected, these indicators should be integrated into operational planning and targeting systems, and appropriate action can be taken.

Intelligence enables the planning and execution of successful operations. MAGTF operations are characterized by unity of effort, high tempo, timely decisionmaking, rapid execution, and the relentless exploitation of opportunities. Intelligence operations must have the flexibility, agility, and sustainability to support these types of operations. Expeditionary Maneuver Warfare, as the Marine Corps' current capstone concept, lays the foundation for MAGTF operations. MAGTF operations include--

- Operational maneuver from the sea (OMFTS).
- Sustained operations ashore.
- Military operations other than war (MOOTW).
- Joint.
- Multinational.

Each operation presents unique challenges and considerations for intelligence support. Many MAGTF operations will be executed as joint operations and with allies, coalition or multinational partners. Intelligence activities in joint and multinational operations require special planning and coordination.

Required Intelligence Capabilities

As a warfighting function, intelligence applies broadly across the full range of military operations. The following required intelligence capabilities are common to all operations:

- Conduct intelligence planning and direction.
- Perform intelligence collection management.
- Process and exploit intelligence.
- Produce intelligence.
- Disseminate intelligence.
- Facilitate intelligence's use.
- Perform intelligence, surveillance, reconnaissance, and CI operations.

CHAPTER 2
COMMAND AND CONTROL

C2 aims to reduce the amount of uncertainty that commanders must accept—to a reasonable point— to make sound decisions. Intelligence is a principal component of C2. Intelligence is a process conducted specifically to aid the commander in decisionmaking by reducing this uncertainty. Intelligence operations support the commander's PDE&A cycle by helping to build situational awareness and providing insight into the nature of the problem facing the commander.

Intelligence provides knowledge concerning the environment and the enemy while furnishing an estimate of potential enemy activities. This knowledge is used by the commander to devise workable, flexible plans; make sound and timely decisions; monitor events to ensure proper execution; and modify decisions quickly in response to changing situations or to exploit fleeting opportunities.

Decisionmaking

The principal aim of C2 is to enhance the commander's ability to make sound and timely decisions. Decisionmaking is a time-competitive process that depends in part on the availability of the right elements of information at the right time and place. Without the information that provides the basis of situational awareness, no commander can make sound decisions. Intelligence operations focus on providing the right elements of information concerning the threat and the environment; i.e, intelligence, required to generate situational awareness and fuel the decisionmaking process.

Observe, Orient, Decide, and Act Loop

A simple model that is known as the observe, orient, decide, and act (OODA) loop is used to describe the C2 process. (See figure 2-1.)

The OODA loop applies to any two-sided conflict, whether combatants are individuals or large military formations. When engaged in conflict, participants—

- **Observe.** Take in information about the environment, the friendly status, and the threat.
- **Orient.** Make estimates, assumptions, analyses, and judgments about the situation to create a cohesive mental image.
- **Decide.** Determine what needs to be done, whether it is an immediate reaction or a deliberate plan.
- **Act.** Put the decision into action.

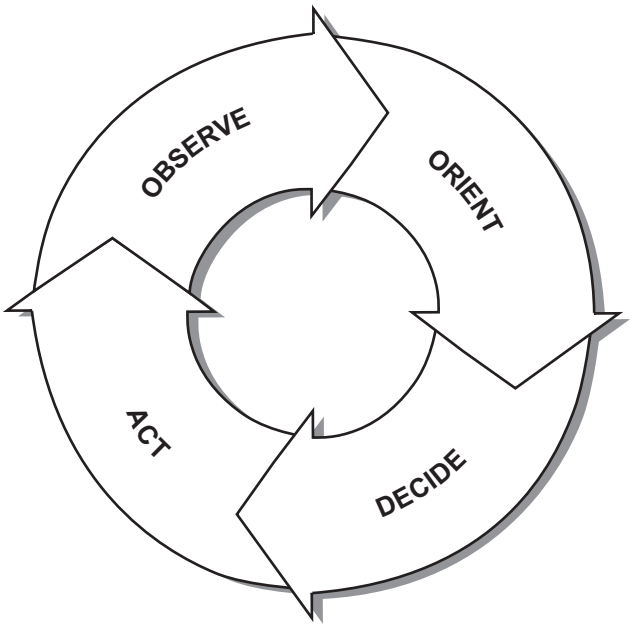

Figure 2-1. The Observe, Orient, Decide, and Act Loop.

The OODA loop reflects how decisionmaking is a continual, cyclical process. In any conflict, the participant who can consistently and effectively cycle through the OODA loop faster—who can maintain a higher tempo of action—gains an increasing advantage with each cycle. The essential lesson of the OODA loop is the importance of generating and maintaining tempo.

Intelligence and the OODA Loop

Intelligence supports all phases of the OODA loop. Intelligence operations facilitate the exercise of C2 by helping to reduce the uncertainty confronting the commander, providing a significant part of the knowledge needed to reach the decision, and assisting in monitoring the implementation and effects of that decision.

- **Observe.** Intelligence collection operations observe threat activity and current environmental conditions. All-source analysis of the collected intelligence information is provided to enhance the commander's situational awareness and understanding of the battlespace.
- **Orient.** The image of the battlespace presented by intelligence, coupled with the predictive analysis of the IPB process, helps orient the commander. It aids in comparing the current situation to the desired end state and in identifying COAs to achieve that end state.
- **Decide.** Intelligence enables decisionmaking by helping define what is operationally possible and most advantageous. It provides the framework for assessing the potential COAs against existing environmental conditions and threat capabilities, vulnerabilities, and likely responses.
- **Act.** Intelligence supports execution by providing a shared picture of the battlespace to all levels of command and by meeting the intelligence needs of all levels of commanders involved in the conduct of operations. Once the concept of operations has been formulated, the focus of intelligence activities shifts from developing the wide-scope intelligence required for COA selection to providing detailed, tailored intelligence to support mission planning and execution. Intelligence is also critical to generating and maintaining tempo in C2. During execution, supporting intelligence operations are conducted to monitor enemy reactions, protect the force from enemy counteraction, and assess the effects of ongoing operations. The continuing intelligence development effort aids the commander in effectively cycling through the OODA loop faster to gain an increasing advantage over the enemy.

Decisionmaking Approaches: Analytical and Intuitive

In analytical decisionmaking, several options for solving the problem at hand are identified, studied, and compared to arrive at the best solution. In intuitive decisionmaking, the commander assesses the situation to recognize a pattern. Once a pattern is identified, experience and judgment guide the commander in evaluating the key elements of the problem and rapidly determining a satisfactory solution. Each approach has different strengths and weaknesses; although conceptually distinct, the two are rarely mutually exclusive.

Intelligence supports analytical decisionmaking by helping to identify the options available and provide the framework (in the form of estimates and studies focused on the threat and key factors of the battlespace) for analysis and comparison of those options. Intelligence supports intuitive decisionmaking by providing the knowledge that helps the commander to recognize emerging patterns. The same methodology is used to develop intelligence support for both decisionmaking approaches. Application of that methodology will vary based on the specifics of each situation and the decisionmaking style of the supported commander. The goal remains the same: to provide a knowledge-based intelligence product that can be applied to make a sound decision.

The Planning, Decision, Execution, and Assessment Cycle

The PDE&A cycle provides a framework for implementing C2. It translates the cognitive process of the OODA loop into a concrete series of actions taken by the commander and the staff to plan and execute an operation. To be effective, intelligence operations must be linked to the commander's decisionmaking process and the resulting operational activity. Therefore, intelligence operations are integrated with the PDE&A cycle. Specific intelligence tasks are carried out to support each phase of this cycle. While the level of command, time available, and specific tactical situation will influence how the PDE&A cycle is carried out and the degree of detail applied in performing intelligence activities, the same basic intelligence development process is employed in deliberate and rapid planning scenarios and supports analytical and intuitive decisionmaking.

Intelligence support to planning begins with providing a basic description of the environmental conditions and enemy situation in the projected area of operations (AO). As plans are developed and refined, the intelligence effort becomes more narrowly focused on identifying the enemy's critical vulnerabilities and potential COAs and generating mission-specific intelligence products that support detailed planning and execution of specific operational activities. Finally, during mission execution, intelligence operations concentrate on the satisfaction of requirements linked to key operational decisions and the recognition of exploitable opportunities as they arise in the battlespace.

Intelligence Support to Planning

Planning is the process of developing practical schemes for taking future actions. It represents an effort to project operational concepts and designs forward in time and space. During the planning process, the commander assesses the situation, builds a vision of the battlespace, and develops the desired outcome of the battle or campaign. Planning is oriented on the future because the primary objective of intelligence is to reduce uncertainty about the future. Intelligence makes a critical contribution to this process. Much of the intelligence effort is "front loaded" to support planning; a substantial portion of intelligence development must be completed during this phase. Intelligence provides a comprehensive image of the battlespace and the threat and helps commanders to provide for constant or predictable aspects of the environment, come to an understanding on the general direction of future actions, and anticipate possible threat force actions and reactions.

Planning Models

The choice of planning model is made on the basis of a variety of factors, including the mission, level of command, command relationships, time available, and preferences of individual commanders. All planning models have the same basic elements in common. They—

- Determine what needs to be done.
- Identify one or more COAs to accomplish the required tasks.
- Study the COAs to test feasibility, identify support requirements, and select the most promising alternative.
- Convey instructions to subordinates to execute the plan.

Intelligence development follows the same basic process, no matter which planning model is used. While the specific steps and sequence used in planning may vary, the requirement to provide focused, continuous intelligence to shape the planning process remains constant. A generic planning model will be used to outline the baseline methodology for providing intelligence support to planning. The components of this generic

model are mission analysis, COA development, COA analysis, and plan/orders development. For a more complete discussion of planning and the planning process, see MCDP 5, Planning, and MCWP 5-1, *Marine Corps Planning Process*. (See figure 2-2.)

Mission Analysis

Mission analysis is conducted to identify the tasks required to accomplish the mission, develop baseline knowledge of the situation, and determine what additional information is required to facilitate the planning process. Intelligence supports mission analysis through providing basic intelligence on the nature of the AO and the threat. Intelligence operations are guided by the results of mission analysis: formulation of initial commander's intent, planning guidance, and PIRs.

Mission Receipt

The receipt of the mission starts the formal planning cycle. However, preliminary planning is normally conducted before the receipt of a mission to anticipate future taskings and potential actions required to accomplish those taskings. Intelligence, in performing its I&W function, will monitor a command's area of interest and identify developing crisis situations and/or potential missions. The commander uses this information to anticipate future missions and to direct the staff to accomplish preliminary planning and intelligence development before the arrival of formal mission tasking. Much of this preliminary

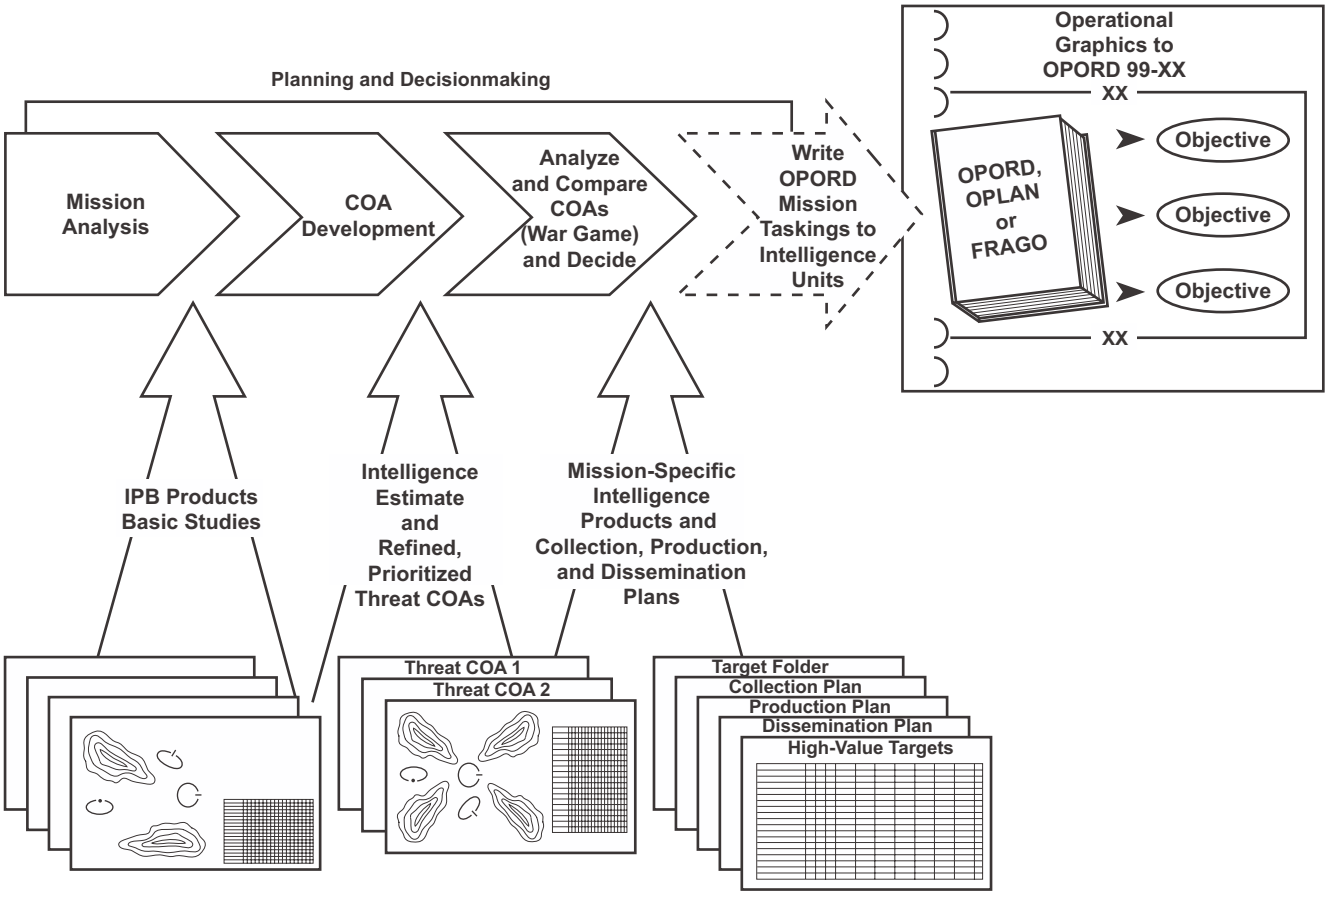

Figure 2-2. Intelligence Support to Planning.

work is carried out by the intelligence section, including collecting basic data on the threat and the environment, IPB analysis, and disseminating intelligence throughout the staff.

Information Requirements and Exchange

The process of identifying IRs and gathering and distributing information within the staff, and throughout the command, begins during preliminary planning and intensifies once the mission is received. Intelligence is provided about threat forces and the AO, focusing on the advantages and limitations presented by the environment and the strengths and critical vulnerabilities of the threat. This intelligence is disseminated through a variety of media: the distribution of basic products (maps, imagery, and threat forces studies); the conduct of orientation briefings, and IPB analysis. The continuous, interactive process of IR development also begins. Products provided by the intelligence section stimulate additional questions from the commander and members of the staff. These questions are translated into new or refined IRs. The new requirements are then used to focus the intelligence development process.

Mission Analysis

The commander makes a critical contribution to the operation during this step, setting the stage for the completion of planning and mission execution. During mission analysis, the commander and the staff draw together all available intelligence and information, focus it on the assigned mission, develop an understanding of the tasks to be accomplished, and formulate a rough concept of how to best accomplish those tasks. The result is an initial statement of commander's intent and commander's planning guidance that focuses the remainder of the planning process.

The intelligence officer is a full participant in mission analysis. During mission analysis, the intelligence officer does the following:

- Orients the commander and the other members of the staff to the battlespace and the nature of the threat.
- Aids in forming the commander's intent by helping to define what is operationally possible and most advantageous. This is accomplished primarily through IPB and the analytical process. These results identify the threat's COG, strengths, and critical vulnerabilities and indicate the potential advantages and limitations imposed by the environment.
- Receives guidance from the commander to help shape the intelligence effort. Guidance can take a variety of forms: a statement of commander's intent, a list of PIRs or direct instructions from the commander about intelligence needs or concerns.

COA Development

Building on the knowledge gained through mission analysis, the commander and staff next develop a concept for carrying out the required tasks that embodies the commander's intent and planning guidance. This concept (or COA) encompasses general schemes for the execution of maneuver, fires, logistics, and other supporting functions necessary for successful implementation of the basic concept.

When time permits, the staff usually develops several COAs on the basis of the commander's intent and planning guidance. Intelligence supports this process by the following:

- Continuously updating the view of the battlespace.
- Defining operational possibilities through the IPB process.
- Identifying intelligence gaps that cannot be filled by organic collection assets.
- Providing the focus on the enemy through identifying the threat's COG, critical vulnerabilities, and potential COAs, emphasizing the most likely and most dangerous of these COAs.
- Ensuring that the commander and staff receive, understand, and use relevant, focused, knowledge-based intelligence that enhances their understanding of the situation, rather than a stream of unfocused information.

The intelligence officer interacts with the staff throughout the COA development process, integrating continuing intelligence development efforts with the potential COAs in an effort to ensure that intelligence will be available to support any COA selected.

When an intuitive approach is used, intelligence helps the commander recognize emerging patterns, identify a workable solution, and rapidly evaluate that solution. Products developed through the IPB process present intelligence in the form of images that permit decisionmakers to quickly visualize the situation, see patterns, and assess potential alternatives.

COA War Game

After COAs are developed, they are analyzed and compared to identify the best COA and the concept of operations to implement that COA. Time permitting, the staff conducts a detailed analysis of each COA; each principal staff officer prepares a formal estimate of supportability. When possible, COAs should be wargamed to predict the action, reaction, and counterreaction dynamics of each COA.

Intelligence assists COA analysis by the following:

- Identifying and refining threat COAs and actions/reactions to friendly COAs under consideration.
- Playing the role of the enemy in the wargaming process.
- Developing an independent evaluation of each friendly COA based on an understanding of the environment and the potential threat response and the ability to provide intelligence support to that COA.
- Helping to focus the staff on the factors of the environment and the enemy, emphasizing the degree of uncertainty and resulting risk associated with each COA.

The intelligence officer's full participation is crucial to successful COA analysis. It is during this step that the full implications of the intelligence estimate are absorbed and applied. To maximize this contribution, the intelligence officer must be able to "think red"—analyze the situation from the enemy's perspective—and "think blue"—understand the intent and construct of friendly plans and operations. Combining these two perspectives enables the intelligence officer to assess the potential effects of threat force actions on the potential COAs.

When time is not available to wargame and conduct a complete COA analysis, the commander makes a rapid mental assessment of available options. The situational awareness that is provided in large part through intelligence guides the commander in evaluating these options and quickly selecting one that offers potential for success.

Orders Development

Based on the COA analysis, the commander selects a COA, refines the intent, and gives further guidance on developing the detailed concept of operations and supporting plans or orders. The emphasis of the intelligence effort, which is focused on the commander's intent, the selected COA, and the identified PIRs, shifts from developing basic and broad-scope intelligence in support of conceptual planning to providing specific intelligence that facilitates functional planning, detailed planning, and mission execution. The intelligence tasks of I&W and supporting the commander's estimate continue, but situation development, support to targeting, and support to force protection now receive increased emphasis.

A concept of intelligence support is prepared to allocate intelligence resources in accordance with the main effort and the concept of operations. COA analysis and wargaming results are used to develop and implement collection, production, and dissemination plans to support the chosen COA. IPB efforts are intensified in an effort to satisfy PIRs and develop the in-depth intelligence required for the detailed planning of specific operational activities. Intelligence sections prepare and disseminate products that embody

the results of the IPB process and intelligence collection activities to provide a shared view of the battlespace at all levels of the force. At the same time, they deliver mission-specific intelligence in response to the extensive and precise functional and detailed planning requirements of units that will execute the operation. CI plans and measures are prepared and implemented to conceal our intentions and protect the force. Results of these intelligence activities shape and develop the overall plan/order and the plan's comprehensive supporting annexes and appendices.

Execution

During execution, the plan is refined, implemented, and adapted in response to changes in the situation and action/reaction of the enemy. C2 is a process that generates swift, appropriate, and decisive action and provides a means of continuously assessing developments that provide the basis for adapting. The commander uses a variety of techniques and measures to supervise, monitor, and modify the execution of the plan, thereby shaping the battle and maintaining unity of effort. The intelligence effort must be responsive to the needs of mission execution and ensure a continuous flow of intelligence throughout the force to maintain a shared picture of the battlespace and satisfy new requirements developed by the operating forces.

Intelligence operations are integrated with the concept of operations to enhance force protection, develop situational awareness, and support combat assessment. The results of these operations are used to modify the plan or exercise tactical options, thereby enabling rapid decisionmaking as well as generating and maintaining tempo. The information developed through these activities is entered into the continuous intelligence development process, which provides the basis for planning future operations.

Intelligence support to execution differs in significant ways from intelligence support to planning. First, while intelligence support to planning requires developing a large volume of basic intelligence and preparing broad-scope estimates to develop and analyze COAs, intelligence support to execution involves the satisfaction of a much larger body of IRs in a significantly greater degree of detail. For example, during COA development, it may be sufficient to tell a MAGTF or ground combat element (GCE) commander that an enemy mechanized force is located in a general area and has an approximate number of tanks and armored personnel carriers of various types. However, the subordinate unit tasked with establishing a blocking position opposite that enemy force will require more detailed information on enemy disposition. In another example, the nature of the intelligence required by a Marine Expeditionary Unit (MEU) commander to decide if a raid or tactical recovery of aircraft and personnel (TRAP) mission is feasible is fundamentally different from the type and detail of intelligence required by the raid or TRAP personnel force commander who will execute that mission.

A second major difference between intelligence support to planning and intelligence support to execution is the time available for developing the intelligence product. Often days, weeks, and sometimes months are available to provide intelligence support to planning, but intelligence support to execution must normally be developed in hours, minutes or even seconds. Success in execution often depends on the ability to provide immediate answers to critical questions concerning threat force dispositions, actions, and intentions.

Finally, the uncertainty and disorder that are inherent in the nature of war manifest themselves primarily during execution. Once execution begins, interaction between the opposing wills of friendly and enemy forces normally causes significant and fundamental changes in

the situation. Discerning environmental conditions and enemy capabilities and intentions becomes increasingly difficult once these forces are set in motion. Yet it is at precisely this time that commanders require detailed and accurate intelligence to help cope with the uncertainty.

The combined factors of the extensive nature of the IRs, the degree of detail required, the limited time available, and the uncertainty inherent during execution make providing intelligence support to execution the most significant intelligence challenge. Intelligence operations must be prepared to meet this challenge and to provide the flexibility and agility required to deliver continuous situational awareness, identify opportunities, and facilitate rapid decisionmaking.

Intelligence support during execution focuses on providing the commander with practical knowledge that gives an exploitable advantage over the enemy. Although eliminating uncertainty during execution is impossible, focused intelligence operations can reduce uncertainty by providing situational awareness and identifying opportunities as they present themselves in the battlespace. Intelligence provides I&W of new or unexpected enemy activities, enhances efforts to engage the enemy through support to targeting, assists in protecting the force through CI measures and operations, and supports the planning of future operations by providing timely and accurate BDA. Three key factors for ensuring effective intelligence support during execution are resource allocation, linkage to operations, and generation of tempo.

Resource Allocation

Since IRs will always exceed available intelligence resources, intelligence operations must focus where they can have the greatest effect. A detailed and well-thought-out concept of intelligence support, developed in accordance with the commander's intent and concept of operations, will provide an appropriate allocation of intelligence capabilities between the main effort and supporting efforts. It is particularly important that Marine Corps forces (MARFOR), MAGTF, and major subordinate commands (MSCs) who control the tasking of intelligence units and capabilities provide access to critical intelligence resources for their subordinate elements. Those intelligence resources best suited to satisfying current, tactical, mission-specific IRs, such as unmanned aerial vehicles (UAVs) or terrain analysts, should be allocated to units responsible for executing the mission.

Linkage to Operations

To provide effective support to execution, intelligence operations must be linked to planned and ongoing operational activity. Intelligence operations are conducted based on the results of the IPB process, wargaming, and the planning process. Collection, production, and dissemination plans are developed to support execution of specific tactical options, engagement of targets, and selecting branches and sequels to the operation plan. Intelligence personnel must have continuous awareness of planned and ongoing operations to monitor potential enemy reactions, identify new opportunities, and assess the effects of actions on the enemy. Close and continuous synchronization of intelligence activities and operations is essential to developing timely, tailored, and relevant intelligence that facilitates rapid decisionmaking and exploitating opportunities in the battlespace.

Generation of Tempo

Intelligence operations during execution must facilitate the generation of tempo. First, intelligence operations generate tempo through prioritization. By focusing intelligence operations on satisfying PIRs and supporting the main effort, intelligence is developed that is directly linked to the commander's intent and C2 effort. Next, intelligence facilitates tempo by supporting the decisionmaking process. Intelligence that provides situational awareness and the ability to recognize emerging patterns enables the commander to employ intuitive decisionmaking to make rapid

decisions that help generate tempo. Finally, intelligence facilitates tempo by providing knowledge—key elements of data and information that have been analyzed, synthesized, and placed in context to help provide situational awareness—not just a mass of unprocessed information or unrelated pieces of data. The critical factor is not the amount of information provided, but key, focused intelligence that is available when needed and in a useful form that improves the commander's knowledge of the hostile situation and his ability to act. Intelligence operations must have the flexibility, agility, and responsiveness to rapidly collect and process relevant information, develop a focused product, and deliver that product to the affected commander in an easily understandable form and in time for the commander to take appropriate action.

CHAPTER 3
DEVELOPING INTELLIGENCE

Intelligence is developed through the use of the intelligence cycle. This process consists of a sequence of related activities that translate requirements for various types of information into intelligence that is furnished to the commander for use in the decisionmaking cycle. During this sequence, intelligence needs are identified; a *plan* is formulated and *directions* are given for satisfying those needs, data is *collected, processed, and exploited* for usable information that is then transformed into a tailored, useful intelligence product that is *disseminated* to and *utilized* by the appropriate commander or unit. This process is called the intelligence cycle. At the same time, a parallel process is used to develop CI plans and measures that deny information to an adversary to protect our forces and help ensure the effectiveness of our operations.

Figure 3-1 shows the six steps of the Marine Corps intelligence cycle. These steps define a sequential and interdependent process for the development of intelligence. Intelligence operations are conducted within the framework of the intelligence cycle; the entire cycle or a specific step within the cycle may be the focus of a particular intelligence activity. Moreover, *all* intelligence, regardless of the scope of the requirement or level of command, is developed by following these steps. (See figures 3-2 and 3-3, page 3-2.)

No single phase of the cycle is more important than the others. All of the phases are interdependent. Without proper direction, the other phases will not focus on the correct objectives. Without effective collection, there may be too much or too little information and what information there is may prove to be irrelevant. Without processing and production, there is a mass of random data instead of the knowledge needed for the planning and execution of operations. Intelligence is meaningless unless it reaches the right people in time to affect the decisionmaking process and in an understandable form.

An understanding of the process used to develop intelligence is critical to the execution of successful intelligence operations. All personnel involved in the *development* and *use* of intelligence must be aware of their role in the process. They must understand the relationship between the steps in the process to ensure that intelligence focuses on the mission and facilitates rapid decisionmaking in

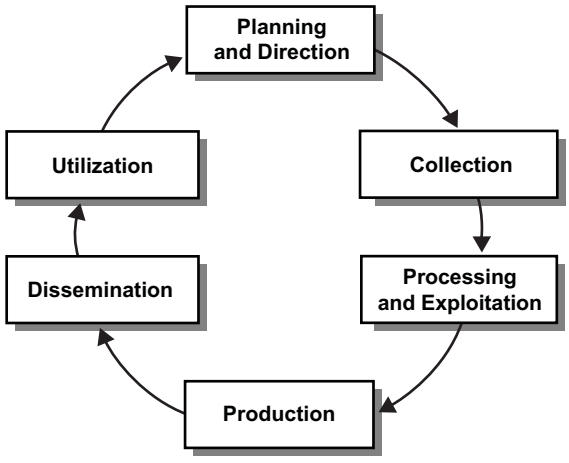

Figure 3-1. The Marine Corps Intelligence Cycle.

the execution of successful combat operations. (See figure 3-4.)

The Intelligence Cycle — Macro View

During a routine review of the situation in the Marine Expeditionary Force's (MEF's) area of interest, the G-2 notes that a recent change in government in one of the countries has created the potential for instability over the next year. The G-2 directs the development of an intelligence estimate to support potential contingency operations in this country. Working with the Marine Corps force G-2 section and the pertinent combatant command's joint intelligence center, the MEF collections section submits requests for imagery intelligence (IMINT), signals intelligence (SIGINT), and HUMINT support. As information is received, the MEF G-2 section's all-source fusion platoon (AFP), with the assistance of the topographic platoon, the imagery intelligence platoon (IIP), and the radio battalion, processes and exploits the information to produce the estimate and supporting studies. The estimate is completed within a month. The G-2 directs that copies be forwarded to all major subordinate commands (MSCs) and staff sections, with priority to the forward-deployed MEU. The G-2 also recommends to the commanding general that the scenario for the MEF's upcoming command post (CP) exercise be based on this estimate to introduce MEF personnel to this contingency area, identify planning requirements, and develop potential COAs. The MEF G-2 has *directed* the development of a comprehensive intelligence product that is focused on an operational requirement. Extensive organic capabilities as well as external resources were integrated to *collect* data, *process* it into information, and *produce* the finished intelligence. The product was then *disseminated* to and *utilized* by the units and staff sections with contingency responsibility for the identified area. The intelligence formulated focuses on the mission and facilitates rapid decisionmaking in the execution of successful combat operations.

Figure 3-2. The Intelligence Cycle—Macro View.

Intelligence Requirements

An intelligence requirement (IR) is a requirement for intelligence to fill a gap in the command's knowledge and understanding of the battlespace or enemy forces. (JP 1-02)

IRs *drive* the intelligence cycle. Properly articulated, mission-oriented requirements focus the intelligence effort and provide the foundation for successful intelligence operations.

The Intelligence Cycle—Micro View

The regiment S-2 section receives a report from one of their reconnaissance teams that an enemy artillery battery has just passed their observation post (OP) and turned off the road. Knowing that enemy artillery is the top targeting priority, the intelligence watch immediately begins developing the target. The S-2 chief checks the map and notes that there are three potential firing positions (identified through the IPB process) close to, but out of visual range of, the reconnaissance OP. The S-2 chief also knows that UAVs are in direct support of the regiment at this time. The S-2 chief alerts the fire support coordination center (FSCC) concerning the potential target and works with the FSCC and air officer to divert an ongoing UAV mission to search the potential firing positions. The UAV quickly locates the enemy artillery in the second firing position. The S-2 chief confirms that the enemy weapons can range friendly positions and, based on their observed activity, are preparing to attack. Using this intelligence, the FSCC coordinates a counterfire mission against the enemy artillery. The S-2 chief successfully executed the intelligence cycle in a matter of minutes. He understood the requirement to develop targeting information, directed the *collection* of information, *processed* the information and *produced* the desired intelligence, that is, a target, and *disseminated* that target to the FSCC, who *utilized* that intelligence to engage the target.

Figure 3-3. The Intelligence Cycle—Micro View.

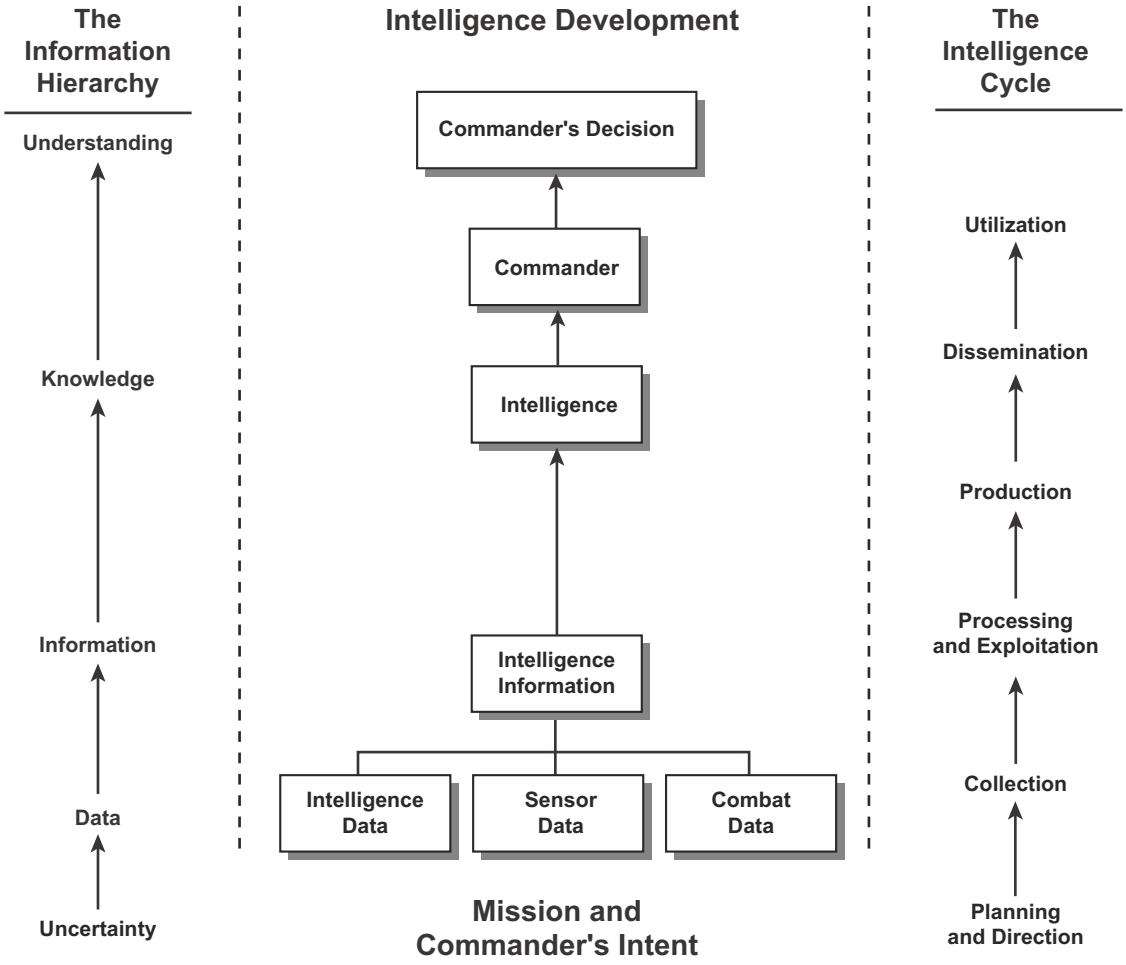

Figure 3-4. Intelligence Development and the Intelligence Cycle.

An IR is a missing piece of information about the enemy or environment that a commander needs to know to make a sound decision. In its simplest form, an IR is a question about the threat or the battlespace, the answer to which is required for the planning and execution of an operation. Examples follow:

- Will the highway bridge support assault amphibious vehicles?
- Will weather conditions interfere with planned air operations?
- Are port facilities and conditions suitable for a maritime prepositioning force pierside offload?
- Can the enemy air defense system threaten low-flying helicopters?
- What is the reaction time of the enemy garrison located south of the amphibious objective area?

Requirements fall into two categories: IRs and PIRs. PIRs and IRs replace the terms essential elements of information and IRs.

Priority Intelligence Requirement

A PIR is an intelligence requirement associated with a decision that will critically affect the overall success of the command's mission. (MCDP 2)

IRs cover the entire spectrum of information that is needed concerning the battlespace and the threat. The scarce intelligence assets and limited time available will rarely permit the satisfaction of all of a command's IRs; thus, it is important to focus the intelligence effort on those requirements that are critical to mission success. These critical IRs are designated as PIRs. PIRs are the subset of the CCIRs that focus on the threat and the environment. CCIRs are intelligence and information requirements the satisfaction of which the commander deems critical to decisionmaking and mission success. PIRs are linked to specific decisions and, in effect, constitute the commander's guidance for intelligence. Notional PIRs follow:

- What size force is defending amphibious force objective B?
- Which bridges over the Sand River are intact?
- Will the enemy use chemical weapons against the beach support area on D-day?

There is no standard list or set rule for determining PIRs. Each tactical situation poses distinct problems and specific gaps in intelligence. However, the commander will often have PIRs that concern the most likely enemy COA, the most dangerous enemy COA, and critical enemy vulnerabilities that can be exploited.

Characteristics

PIRs and IRs have the following characteristics. Each PIR or IR—

- Asks only one question.
- Focuses on specific facts, events or activities concerning the enemy or the battlespace.
- Is tied to mission planning, decisionmaking, and execution.
- Provides a clear, concise statement of what intelligence is required.
- Contains geographic and time elements to limit the scope of the requirement.

Requirements may be simple or complex. It is important to understand that the nature and scope of PIRs and IRs will vary with the mission and the level of command, and on the particular phase in the PDE&A cycle. Requirements will generally become more focused as the intelligence cycle is executed. During execution, the intelligence effort should be directed against a small number of PIRs that are closely linked to the concept of operations.

Planning and Direction

The planning and direction phase of the intelligence cycle consists of those activities that identify pertinent IRs and provide the means for satisfying those requirements. (See figure 3-5.) Intelligence planning and direction is a continuous function and a command responsibility. The commander directs the intelligence effort. The intelligence officer manages this effort for the commander based on the intent, designation of PIRs, and specific guidance provided during the planning process.

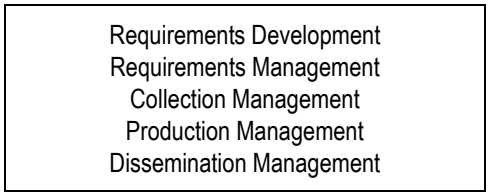

Figure 3-5. Planning and Direction Phase Functions.

Requirements Development

Identification of Requirements

Concise, mission-oriented IRs provide clear direction to the intelligence effort. The entire staff and all subordinate commanders play a role in developing the command's IRs. The intelligence officer formulates most of the initial requirements by using the original mission

tasking together with knowledge of the threat, familiarity with the operating area, and experience derived from participation in the commander's decisionmaking process to anticipate the majority of the basic intelligence needs. As the planning process continues, the commander, other staff officers, and subordinate commands expand on previously identified requirements and develop new ones. Requirements are generally linked to proposed COAs or potential decisions. The intelligence officer records, collates, and refines these requirements as they are identified and maintains a consolidated list of requirements.

Designation of PIRs

The commander makes a critical contribution to the intelligence effort by designating the PIRs. As COAs and supporting information requirements are developed, the satisfaction of certain IRs will be essential to mission success. The identification of these "show stoppers" forms the basis for designating PIRs. The intelligence officer, with input from other members of the staff, draws up a recommended list of PIRs. PIRs will be listed in priority order relative to their importance to mission accomplishment. In forming this list, the G-2/S-2 considers the requirements of his own command, subordinate commands, adjacent commands, and any direction received from higher headquarters. Recommendations are submitted to the commander who reviews, refines, and approves the command's PIRs. In designating PIRs, the commander establishes the following:

- What he wants to know (intelligence required).
- Why he wants it (linked to operational decisionmaking).
- When he needs it (latest time that the information will be of value).
- How he wants it (format, method of delivery).

Once approved and distributed, PIRs constitute the core of the commander's guidance for the intelligence process.

Requirements Management

Management of IRs is a dynamic process that encompasses the continuous evaluation of the following:

- Importance of each requirement to mission success.
- Information and assets needed to satisfy each requirement.
- Resources that are presently committed toward fulfilling that requirement.
- Degree that the requirement has been satisfied by completed intelligence activities.

Processing Requirements

Developing requirements and designating PIRs are not one-time efforts. There is a dynamic flow of new requirements, existing requirements are satisfied or no longer relevant, and the relative importance of each requirement changes as the PDE&A cycle progresses. (See figure 3-6.) As requirements are developed, the intelligence officer validates, refines, and enters them into the management system.

Validation ensures that the requirement is relevant to the mission, has not already been satisfied, and does not duplicate other requirements.

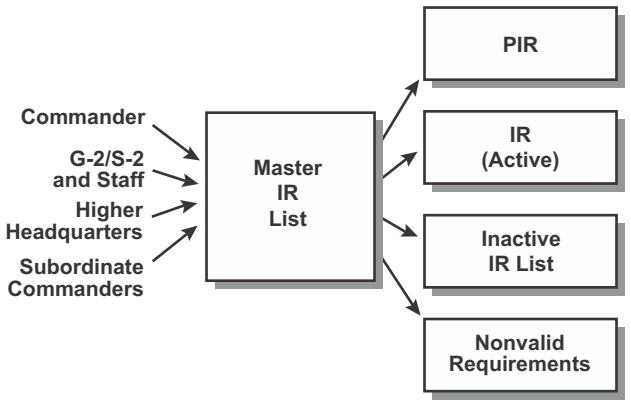

Figure 3-6. Intelligence Requirements Management.

Refining the requirement entails placing it in the proper format, identifying all information components related to the requirement, and adding appropriate qualifiers such as geographic limitations or time constraints. During refinement, similar or related requirements may be combined into a single, comprehensive requirement.

A requirements management system is an essential tool that provides a means to monitor the effort to satisfy each requirement. Each intelligence section must develop a system appropriate to its mission and echelon. Minimal components of any system are a numbering system, identification of who submitted the requirement, designation of collection and production resources committed to satisfying the requirement (or noting when it was submitted to higher headquarters or supporting forces, if organic assets are not available), timeliness requirements, dissemination instructions and information, and a mechanism to ensure user satisfaction.

Determining Priorities

The intelligence officer must continually reassess the emphasis given to each requirement and realign the priorities according to commander's intent and the current phase of the PDE&A cycle. The intelligence officer must also periodically confirm assignment of priorities with the commander to ensure that the intelligence effort is focused in accordance with the commander's desires.

Requirements Satisfaction

Once a requirement has been identified, validated, refined, and prioritized, the intelligence officer must determine how to satisfy the requirement and, if it can be satisfied by organic assets, allocate the appropriate intelligence assets to develop the desired intelligence. If the requirement cannot be satisfied by organic assets, it must be submitted to higher headquarters or supporting forces/agencies for satisfaction. In determining how to satisfy a requirement, the intelligence officer must consider each step in the intelligence cycle to ensure that the plan encompasses the entire process from collection through utilization. The intelligence officer must identify the information needed, where and how to get it, how to package the intelligence into an appropriate product, and how to deliver that product. Normally, an IR will generate a requirement to do the following:

- Collect data or information.
- Process and produce intelligence in the scope and form that answers the question.
- Disseminate the information to a particular user by a specific time. (See figure 3-7.)

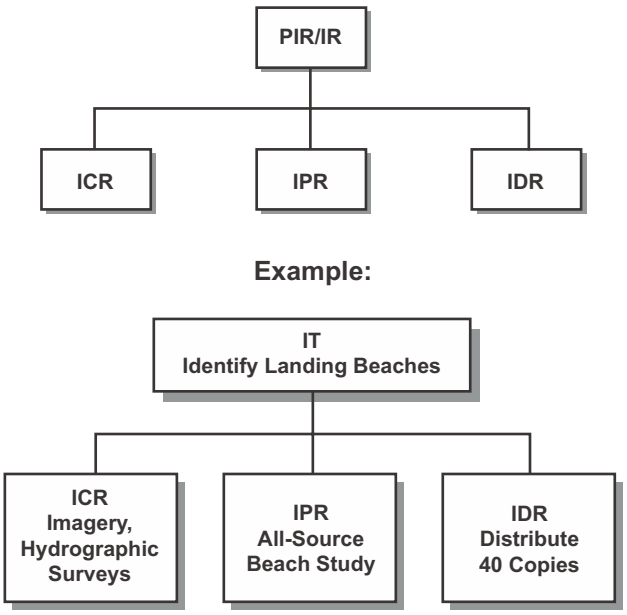

Figure 3-7. Requirements Satisfaction.

Directing the Intelligence Effort

Intelligence direction consists of the requirements development and management process described above combined with the associated functions of collection management, production management, and dissemination management. Because the possible questions about the enemy and the AO are practically infinite but intelligence assets are limited, the intelligence effort must be managed at each step in the process. Management of requirements, collection, production, and dissemination ensures that the effort is focused on the PIRs and delivers knowledge that facilitates sound tactical decisionmaking.

Collection Management

Collection management is the process of converting IRs into collection requirements, establishing priorities, tasking or coordinating with appropriate collection sources or agencies, monitoring results, and retasking, as required. Its purpose is to conduct an effective effort to collect all necessary data while ensuring the efficient use of limited and valuable collection assets.

Production Management

Production management encompasses determining the scope, content, and format of each product; developing a plan and schedule for the development of each product; assigning priorities among the various intelligence production requirements; allocating processing, exploitation, and production resources; and integrating production efforts with collection and dissemination. As with collection management, the goal is to make effective and efficient use of limited resources and ensure that the production effort is properly focused on established priorities.

Dissemination Management

Dissemination management involves establishing dissemination priorities, selecting dissemination means, and monitoring the flow of intelligence throughout the command. Its objective is to deliver the required intelligence to the appropriate user in the proper form at the right time while ensuring that individual consumers and the dissemination system are not overloaded by attempting to move unneeded or irrelevant information. Dissemination management also provides for use of security controls that do not impede the timely delivery or subsequent use of intelligence while protecting intelligence sources and methods.

Planning the Intelligence Support System

This activity includes designing and establishing the structure that is necessary to provide intelligence support throughout the course of an operation. The intelligence officer looks at the entire body of IRs rather than at individual IRs or PIRs. The intelligence officer anticipates the continuing intelligence needs of the force as it carries out its mission and designs an intelligence support system that has the capability, flexibility, and redundancy to satisfy these needs. After the support system concept is developed, the resources needed to build the system are identified, requested, and acquired. Factors taken into consideration during this effort follow:

- Task organization of intelligence units.
- Identification of personnel and equipment requirements.
- Requirement for liaison teams.
- Connectivity with national, theater, joint, and multinational force intelligence assets.
- Communications and information systems (CIS) requirements.
- Logistic requirements.
- The need for specialized capabilities; e.g., linguists.

Collection

Collection is the gathering of intelligence data and information to satisfy the identified requirements. The collection phase encompasses assembling relevant information from sources that are already on hand or available from other intelligence organizations: intelligence databases, studies, maps, and a workbook or situation map. Collection consists of the activities of organic, attached, and supporting intelligence collection assets to gather new data and deliver it to the appropriate processing or production agency; i.e., the execution of collection operations. Functions carried out during the execution of collection operations follow:

- Mission planning.
- Positioning of assets to locations that are favorable to satisfying collection objectives.

- Data collection.
- Reporting.
- Supervision of individual collection missions.

Intelligence data and information are collected by a variety of intelligence assets, each with unique capabilities and limitations. (See figure 3-8.)

Figure 3-8. MAGTF Primary Organic Collection Assets.

The value of a collection source is not necessarily related to the sophistication or cost of that source, but rather to its ability to gather pertinent data from the collection target—the enemy or environmental consideration that is the subject of the particular intelligence collection requirement. Successful intelligence operations require access to data from all types of collection resources: organic, joint, national, and multinational. Collection operations are executed to gather data from all suitable and capable assets, balancing the capabilities of one type of collector against the limitations of another to provide "all-source" data input to the processing and exploitation and production phases. The primary types of intelligence data used to produce tactical intelligence are described in the following paragraphs.

Imagery Intelligence

Imagery intelligence is intelligence derived from the exploitation of collection by visual photography, infrared sensors, lasers, electro-optics, and radar sensors such as synthetic aperture radar wherein images of objects are reproduced optically or electronically on film, electronic display devices, or other media. (JP 1-02)

Principal sources of imagery are national overhead reconnaissance systems; manned aircraft such as the F-14 or F/A-18 with the Advanced Tactical Airborne Reconnaissance System, the U-2 or the Joint Surveillance Target Attack Radar System; and UAVs. IMINT provides concrete, detailed, and precise information on the location and physical characteristics of the environment and the threat. It is the primary source of information concerning key terrain features, installations, and infrastructure used to build detailed intelligence studies and target materials. The main limitation of IMINT is the time required to task, collect, process, and analyze the imagery. Detailed planning and coordination is required to ensure that the results of imagery collection missions are received in time to affect the decisionmaking process. Imagery operations can be hampered by weather, the enemy's air defense capability, and his camouflage, cover, and deception activities.

Signals Intelligence

SIGINT is intelligence information derived from the interception, processing, and analysis of foreign communications, noncommunications electronic emissions, and instrumentation signals. SIGINT is provided by the radio battalion; the Marine tactical electronic warfare squadron; and an integrated network of national, theater, and joint force SIGINT support agencies. SIGINT provides timely and accurate data on enemy forces that may include details on enemy composition, identification, and location. It can also give insight into the enemy's current status and activities and future intentions. SIGINT is one of the primary means for providing I&W of enemy actions. It is also a principal contributor to intelligence support to IO through its analysis and exploitation of the enemy's C2 system. Principal limitations of SIGINT are that the enemy must transmit signals that can be exploited and that

collection assets must be capable of intercepting and positioned to intercept those signals.

Human Intelligence

HUMINT is a category of intelligence derived from information collected and provided by human sources. (JP 1-02)

HUMINT operations cover a wide range of activities, including reconnaissance patrols, aircrew reports and debriefs, debriefing of refugees, and interrogations of enemy prisoners of war. Principal dedicated HUMINT resources are ground reconnaissance units; the CI and interrogator-translator assets of the MEF CI/HUMINT company; and national, theater, and other Service HUMINT elements. All Marines participating in an operation can obtain significant information about the threat and environment. Intelligence operations must aggressively employ Marines as HUMINT sources by teaching them the importance of observing and reporting.

HUMINT can provide insight into intangible factors such as tactics, training, morale, and combat effectiveness that cannot be collected by technical means and offers the best potential source to discern future plans and intentions. HUMINT is particularly important in MOOTW, in which the nature of the mission and of the threat generally provide a lucrative environment for HUMINT operations.

HUMINT has two main limitations as follows:

- HUMINT operations generally require placing humans at risk to gain access to their targets. For that reason, IRs should be satisfied through technical collection means, if possible, before considering the use of human resources.
- HUMINT responsiveness can be limited in certain circumstances because of the time it takes to plan the activities, position the assets, collect the data from what are often hostile or noncooperative sources, and report the information to exploitation and production centers, which are often located a significant distance from the collection site.

Measurement and Signature Intelligence

Measurement and signature intelligence (MASINT) is intelligence information gathered by technical instruments such as radars, passive electro-optical sensors, radiation detectors, and remote ground sensors. Although the primary tactical application of these devices is to collect sensor data, which is generally provided directly to operations centers for immediate decisionmaking, the data collected can also provide significant intelligence information on enemy movements and activities. Key MAGTF MASINT capabilities are remote ground sensors, weapons locating radars, and air surveillance radars. These sensors provide an efficient means to maintain surveillance over large portions of the battlespace. Their limitations include the logistic support required to maintain the equipment, the requirement to place the sensors in proximity to the surveillance area, and the exploitable electronic signatures associated with some of the sensors.

Open-Source Intelligence

Open-source intelligence (OSINT) is information of potential intelligence value that is available to the general public. (JP 1-02)

OSINT sources include books, magazines, newspapers, maps, commercial electronic networks and databases, and radio and television broadcasts. OSINT involves no information that is classified at its origin or acquired through controlled collection. National and theater intelligence production centers have access to a range of OSINT sources. MAGTF intelligence agencies can receive OSINT through these centers in addition to collecting information from open sources that are available in the AO. OSINT can be a valuable source of geographic, political, economic, sociological, and cultural information, particularly in security, humanitarian assistance or peace operations. In multinational operations, OSINT provides intelligence that can be readily shared with members of a multinational force. However, the sources of OSINT should be carefully evaluated to determine the accuracy and reliability of the information provided.

Counterintelligence

CI is the intelligence function concerned with identifying and counteracting the threat posed by foreign intelligence capabilities and by organizations or individuals engaged in espionage, sabotage, subversion or terrorism. The principal objective of CI is to assist with protecting DOD personnel, family members, resources, facilities, and critical infrastructure. CI provides critical intelligence support to command force protection efforts by helping identify potential threats, threat capabilities, and planned intentions to friendly operations while helping deceive the adversary as to friendly capabilities, vulnerabilities, and intentions. CI increases uncertainty for the enemy, thereby making a significant contribution to the success of friendly operations. CI also identifies friendly vulnerabilities, evaluates security measures, and assists with implementing appropriate security plans. The integration of other intelligence disciplines, CI, and operations culminates in a cohesive unit force protection program.

Processing and Exploitation

Processing and exploitation involves the conversion of collected data into information that is suitable for the production of intelligence. Processing is largely a technical function that does not add meaning to the data but that is necessary to convert the data into a form that people can understand. Examples of processing include developing a piece of film, translating a document or communications intercept from a foreign language or converting electronic data into a standardized report that can be analyzed by a system operator. Some types of data require minimal processing. They may be collected in a form that is already suitable for production. Processing may also take place automatically during collection. Other types of data require extensive processing, which can affect the timeliness and accuracy of the resulting information.

Data may be further exploited to gain the fullest possible advantage. For example, an aerial photograph or a frame of UAV video may be exploited by imagery interpreters to identify specific pieces of equipment or measure the dimensions of structures found on that image. When resources are required to accomplish the processing and exploitation phase, it is crucial that processing requirements be prioritized and managed according to the PIRs to ensure that critical information is extracted first.

Production

Production is the activity that converts information into intelligence. It involves the evaluation, interpretation, integration, analysis, and synthesis of all information that is relevant to a particular IR to answer the question that has been asked. Production fuses new information and existing intelligence from all sources to provide meaningful knowledge that can be applied to the decisionmaking process. During the production phase, information is—

- Evaluated to determine pertinence, reliability, and accuracy.
- Analyzed to isolate significant elements.
- Integrated with other relevant information and previously developed intelligence.
- Interpreted to form logical conclusions that bears on the situation and supports the commander's decisionmaking process.
- Applied to estimate possible outcomes.
- Placed into the product format that will be most useful to its eventual user.

Intelligence Preparation of the Battlespace

IPB is the primary analytical methodology used to produce intelligence in support of the decisionmaking process. It furnishes a framework for integrating intelligence and operations throughout the PDE&A cycle. IPB is a systematic, continuous, mission-focused process of analyzing the

environment and the threat in a specific geographic area. (See figure 3-9.)

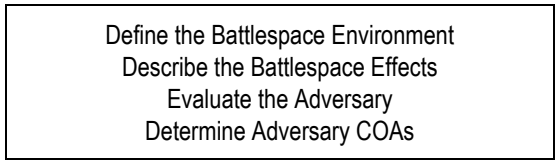

Figure 3-9. Intelligence Preparation of the Battlespace.

IPB provides a means to interpret information and understand the battlespace that can be applied in any operational situation. Through the IPB process, information that has been collected and processed is analyzed, synthesized, and used to estimate possible outcomes that can affect mission accomplishment. The result is knowledge-based intelligence that is incorporated into a variety of intelligence products.

Although IPB is fundamentally an intelligence process, successful application of the process to support planning and execution depends on the participation of the commander and the entire staff. The commander is responsible for intelligence production and IPB. The commander focuses the IPB effort by defining the area and key factors to be studied. The commander's guidance and the complete involvement of the staff are necessary to ensure that the IPB effort encompasses aspects of concern for all warfighting functions and provides detailed and accurate intelligence for COA development and detailed planning. Finally, the commander ensures that the IPB process is fully integrated with mission planning and execution. IPB is an effective tool only when the results are used to develop plans and support decisionmaking during execution.

IPB emphasizes providing intelligence in the form of graphics and images—formats that help the commander to rapidly visualize, assimilate, and apply the intelligence in the decisionmaking process. During planning, products generated from IPB place large volumes of intelligence in context, providing situational awareness for everyone involved in the planning effort. These products form the basis of, or are combined with, the planning tools and decision support aids prepared by other staff sections to provide an integrated planning and execution support product. During execution, the use of graphics display intelligence increases the commander's ability to discern patterns as they are emerging and to conduct intuitive decisionmaking, thereby increasing operational tempo.

Levels of Production

Intelligence production can be extremely simple or incredibly complex. At the MAGTF CE level, particularly during deliberate planning, production normally entails developing detailed, all-source estimates and studies through the combined efforts of several intelligence support elements. During tactical execution, time constraints and the demands of the ongoing battle require rapid processing and production, with an emphasis on developing simple, mission-focused intelligence products such as a hand-annotated image of a helicopter landing zone (HLZ), a target description or an overlay depicting current and future enemy dispositions. An enlisted intelligence specialist on duty in an infantry battalion command post may develop dozens of intelligence products during his watch in the form of answers to questions concerning the enemy situation, targets or terrain to be traversed. Valuable intelligence does not result solely from the investment of time or resources. It is developed by placing relevant information in context, converting it into knowledge through analysis and synthesis, and applying that knowledge to the decisionmaking process.

There is inherent friction between the desire to provide as complete and accurate an intelligence product as possible and the continuous requirement to support the time-sensitive urgency of tactical decisionmaking. In practice, these conflicting demands must be balanced by using

stated direction, such as the commander's intent and PIRs, and knowledge of the operational situation to determine when to finish and disseminate the product. To provide a framework to make these determinations, intelligence production can be viewed as occurring on two levels: deliberate and immediate.

Deliberate production is employed when there is sufficient time to thoroughly evaluate, analyze, and synthesize all available information and produce a formal intelligence product such as a written intelligence estimate, scheduled report or detailed target/objective area study.

Immediate production is conducted to identify, process, and place in context elements of data, information, and intelligence that have a direct effect on ongoing or near-term operations. These elements are subjected to a compressed version of the production process, and the resulting product is rapidly disseminated to those who are affected. Immediate production is normally conducted during execution and results in simple, mission-specific intelligence products: situational assessments or answers to specific, individual IRs. There is no absolute distinction between the two levels. The nature of the situation and pertinent IRs will dictate the amount of time available to complete each production effort. Likewise, IPB methodology should be used during both types of production. However, during immediate production, a rapid mental evaluation and integration of the relevant factors of the threat and environment are used, usually building on a deliberate production effort that has already been completed.

Dissemination

Dissemination is the timely conveyance of intelligence to users in an appropriate form. Many times, intelligence operations focus almost exclusively on the collection and production phases, with the intelligence cycle often breaking down because insufficient attention is given to the dissemination phase. Dissemination must be planned and supervised to the same degree as collection and production or we risk failure of the intelligence support function. Determining the form and selection of the means to deliver the product are key aspects of the dissemination process.

Form

Determining the form to be used in disseminating the intelligence product is a function of several factors: the purpose of the intelligence product, the urgency and relevance of the intelligence to ongoing operations, the type and volume of the intelligence, the user's capability to receive intelligence products, and the dissemination means available. Because decisionmaking is a mental process and human beings think and understand primarily in the form of images, the goal of intelligence dissemination is to convey an accurate image of the battlespace or threat to the decisionmaker in a form that facilitates rapid understanding of that image. For this reason, graphics are the preferred dissemination form. (See figure 3-10 and figure 3-11 on page 3-14.)

Although oral briefings and written reports are the primary dissemination forms used today, the use of automated systems is increasing the capability to develop graphic products. Imagery, overlays, diagrams, and schematics enhanced with appropriate textual data and annotations will be used as the baseline dissemination format whenever possible. However, in time-sensitive situations, the verbal report or short text message may be the most expeditious dissemination form. Whether oral, text or graphic, intelligence products should use standard formats whenever possible. Standard formats facilitate ease of preparation and dissemination, as well as usability of the intelligence product.

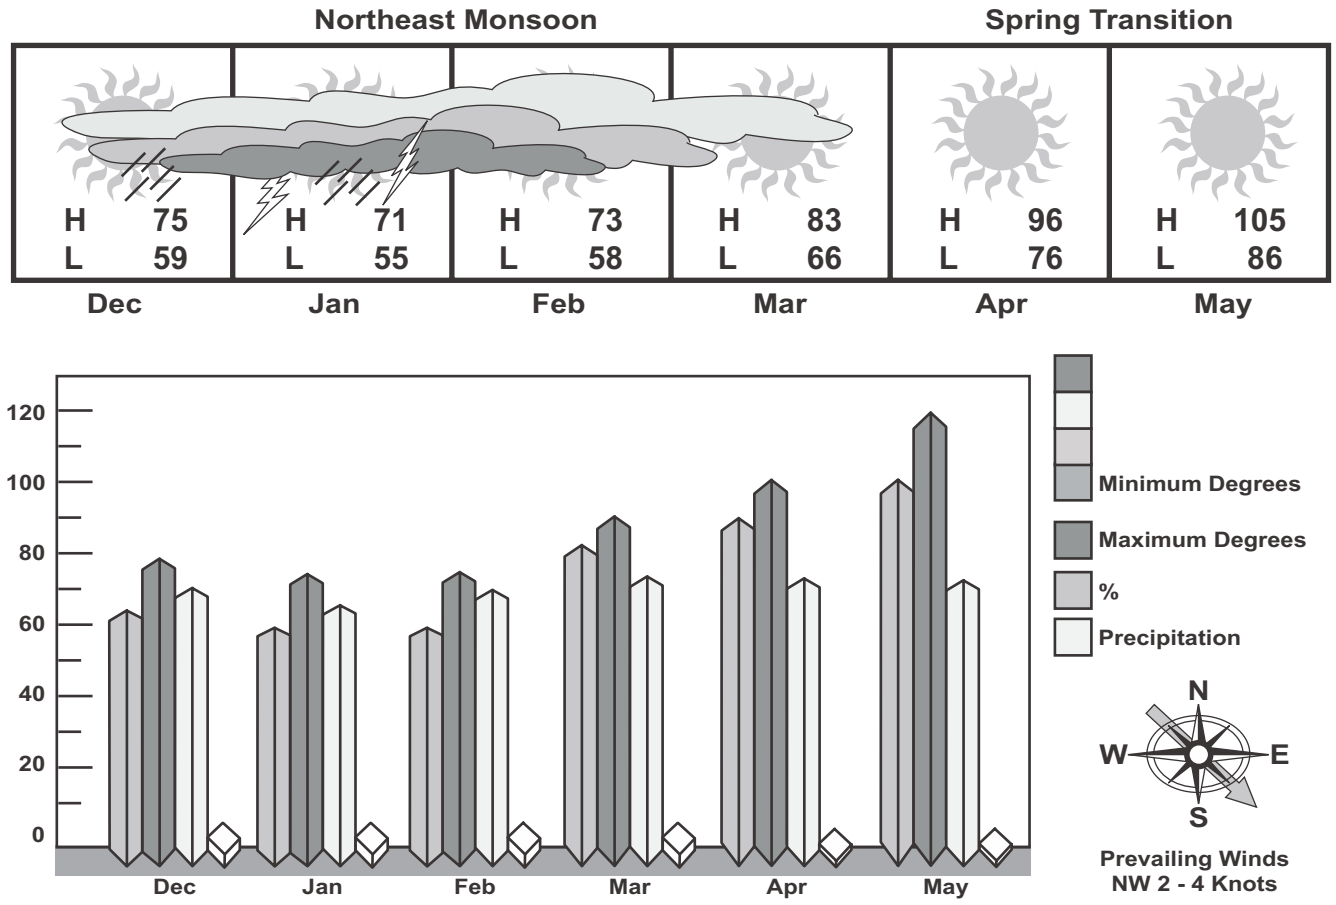

Figure 3-10. Graphic Climatology Study.

Delivery

Delivery of the intelligence product to the right person in a timely manner is directly related to the choice of the means used to disseminate that product. Dissemination is managed by using a combination of methods, channels, and modes to convey the product to the user.

Methods

There are two basic methods used to disseminate intelligence: supply-push and demand-pull. A supply-push system pushes intelligence from the collectors/producers to the users as it becomes available. The main advantage to this method is that users do not have to initiate requests to receive products. However, there is potential for information overload in a supply-push system. To prevent information overload, the dissemination node should tailor what it is passing through the system, not simply dump everything that it has received or developed.

The demand-pull mode provides access to intelligence on an as-needed basis. The user draws the required intelligence from the intelligence support system through a series of searches or inquiries. The use of demand-pull decreases the volume of intelligence being transmitted and diminishes the possibility of overwhelming units with superfluous products. However, demand-pull can also reduce the timeliness of dissemination by developing and providing intelligence only after a request has been received.

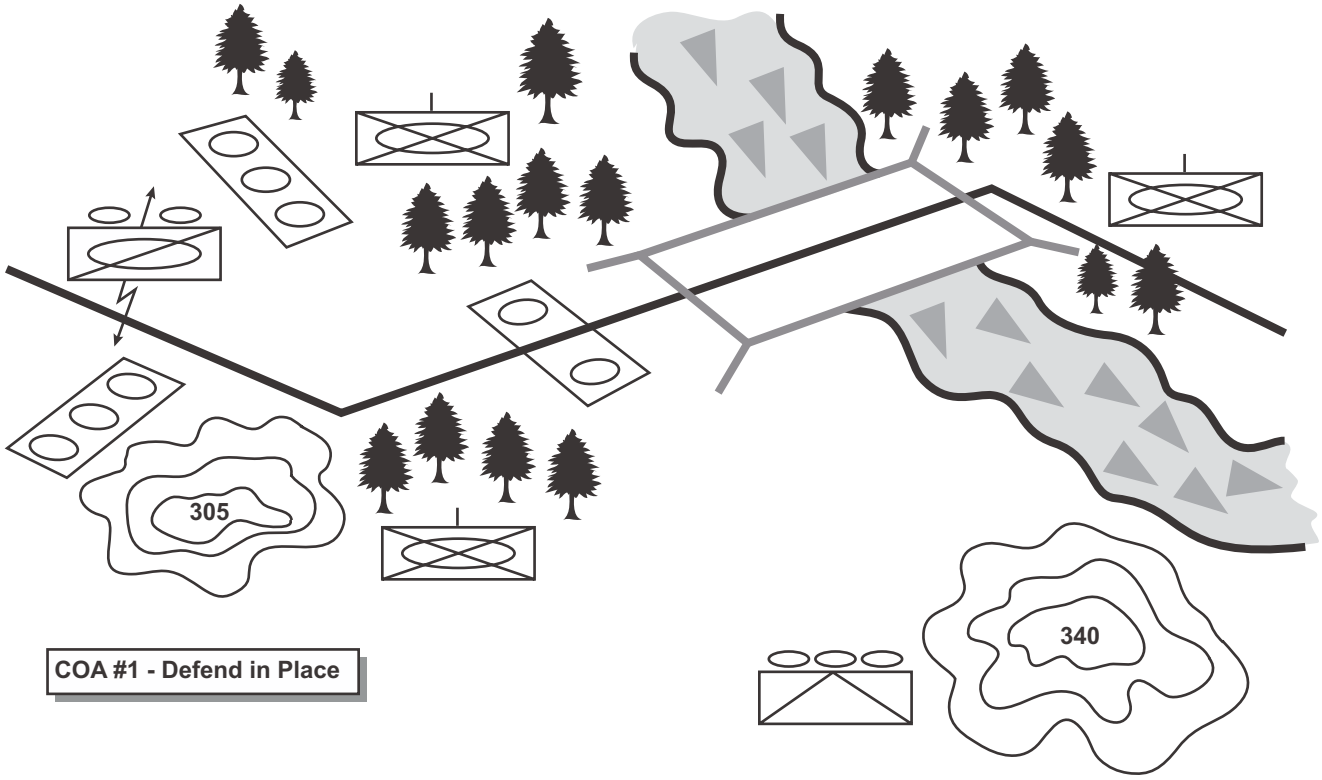

Figure 3-11. Graphic Intelligence Estimate.

The dissemination system must provide the flexibility to use either method, "pushing" important or time-sensitive intelligence directly to the users, while at the same time permitting them to "pull" other relevant intelligence as needed from readily accessible sources such as a database or a watch section at an intelligence center.

Channels

Intelligence is disseminated by using two types of channels: *standard* and *alarm*. Standard dissemination is used for routine intelligence and is transmitted according to a set order and format, usually along established command or staff channels. Examples include the formal staff briefing and standardized reports. The alarm channel is used to disseminate critical, time-sensitive intelligence that can have an immediate effect on the conduct of the operation, such as I&W of hostile activity. I&W alarms must be disseminated rapidly to all units that are affected by that intelligence. Although the standard channel is used to satisfy the majority of dissemination requirements, care must be taken to monitor the flow of what is passing through the pipeline to ensure that the intelligence provided is timely and pertinent to the units receiving it. A particularly important connection that is often neglected in standard dissemination is *lateral dissemination*; intelligence must flow laterally between units as well as up and down the chain of command. The exchange of intelligence between the GCE, aviation combat element (ACE), and combat service support element (CSSE) is an especially important link in ensuring that all commanders have a shared picture of the battlespace.

Modes

Finally, intelligence is disseminated in one of two modes: *broadcast* or *point-to-point*. In broadcast

dissemination, intelligence that affects the majority of units is sent simultaneously to a broad audience. Examples include I&W alarms, intelligence products developed by the MAGTF G-2 section that support the entire MAGTF, and reporting from organic collection assets. Broadcast dissemination may be web-based. Successful use of the broadcast mode depends on several factors, including judicious selection of what intelligence is broadcast, the ability of the appropriate users to monitor the broadcast, and employment of a processing methodology or system to filter and select for detailed examination only those broadcast items that are pertinent to the user's requirements. Undisciplined use of this mode can quickly lead to information overload. In the point-to-point mode, intelligence is sent to a specific user or users, normally in response to a specific request or requirement, and is passed along sequentially as appropriate. Dissemination across the system is slower but is more focused and can provide intelligence that is tailored to the needs of each individual unit. Point-to-point dissemination may be enhanced through the use of classified e-mail systems.

Architectures

Intelligence architectures provide the means to disseminate intelligence. (See figure 3-12 on page 3-16.) Dissemination planning analyzes and anticipates the dissemination requirements and designs the appropriate architecture to meet those requirements. The architecture should employ all methods, channels, and modes in a flexible, integrated system. The objective is to provide the right intelligence to the appropriate user in a timely manner, while at the same time not overwhelming him with a massive amount of unfocused data.

Architectures will be developed with the objective of facilitating the exchange of *graphic* intelligence throughout the force, down to the lowest tactical echelon. The means will consist of a combination of procedures, CIS, and communications networks, effectively supervised by intelligence specialists to ensure that the dissemination requirements are being satisfied. The intelligence architecture must be interoperable with the overall CIS architecture employed by the MAGTF and the joint force.

Utilization

Intelligence has no inherent value. Its value is realized through its support to operations. Thus, the intelligence cycle is not complete until the intelligence that has been developed is used in decisionmaking during planning and/or execution. The commander is responsible for the effective use of intelligence and for ensuring that decisions are based on the foundation provided by intelligence. The intelligence officer facilitates the effective use of intelligence, supervises the entire intelligence development effort, and assists the commander and the staff in understanding the intelligence product and its application.

The utilization phase also provides the basis for the continuous functioning of the intelligence cycle. On one hand, utilization will determine whether a requirement has been completely satisfied; requirements that have not been met will require additional intelligence development efforts. On the other hand, the satisfaction of one requirement normally generates new or additional requirements, the answers to which are needed to further refine or focus the decisionmaking process. In either case, utilization provides guidance and feedback that are used to initiate the next iteration of the cycle.

Figure 3-12. Notional Marine Expeditionary Force Intelligence Architecture.

Application of the Intelligence Cycle

The intelligence cycle is a procedural framework for developing mission-focused intelligence support. It is not an end in itself, nor should it be viewed as a rigid set of procedures that must be carried out in an identical manner on all occasions. The commander and the intelligence officer must consider each IR individually and apply the intelligence cycle in a manner that develops the required intelligence in the most effective way.

Application of the intelligence cycle will vary with the phase of the PDE&A cycle. In theory, a unique iteration of the intelligence cycle is carried out for each individual requirement. In practice, particularly during the planning phase, requirements are grouped together and satisfied through a single, concurrent intelligence development process. During the planning phase, intelligence development is generally carried out through two major iterations of the intelligence cycle.

The first primarily supports decision planning. Completing this iteration of the intelligence cycle results in preparing and using basic intelligence products—an intelligence estimate, supporting studies, and IPB analysis—that describe the battlespace and threat. These products form the basis for developing and selecting COAs.

The second iteration of the intelligence cycle supports execution planning. Decision and execution planning are defined and discussed in MCDP 5. It is an outgrowth of selecting the COA and forming a concept of operations. Implementing the collection plan, refinement of IPB analysis, and generating mission-specific intelligence products are integrated with the concept of operations to support mission execution. During execution, requirements are satisfied on a more individualized basis. New requirements are usually generated in response to a specific operational need. Each requirement is unique and must be satisfied in a timely manner to facilitate rapid decisionmaking and generating or maintaining tempo. (See figure 3-13 on page 3-18.)

The intelligence cycle will also be applied differently depending on the mission and the organizational level of the unit. For example, a MAGTF G-2 section will normally have a separate section that is specifically responsible for each phase of the intelligence cycle—a collections section, processing and exploitation agencies, a production element, and a dissemination section—with an intelligence operations section providing planning and direction for the overall effort. At the MAGTF level, intelligence is normally developed to satisfy multiple requirements concurrently, with simultaneous collection, processing, production, and utilization efforts being carried out by the separate functional sections. In contrast, a battalion or squadron S-2 section must carry out the cycle with a limited number of resources. It will generally focus on a single requirement or a small number of closely related requirements, moving through each phase of the cycle sequentially until that requirement is satisfied.

Counterintelligence

CI is the function of intelligence that is concerned with identifying and counteracting the threat posed by hostile intelligence capabilities and by organizations or individuals engaged in espionage, sabotage, subversion, or terrorism. The objective of CI is to enhance the security of the command by denying an adversary information that might be used to conduct effective operations against friendly forces and to protect the command by identifying and neutralizing espionage, sabotage, subversion, or terrorism efforts. (MCWP 2-14, *Counterintelligence*)

Responsibilities

CI, like all intelligence matters, is a command responsibility. In preparing for operations, all units must develop a CI plan and implement appropriate

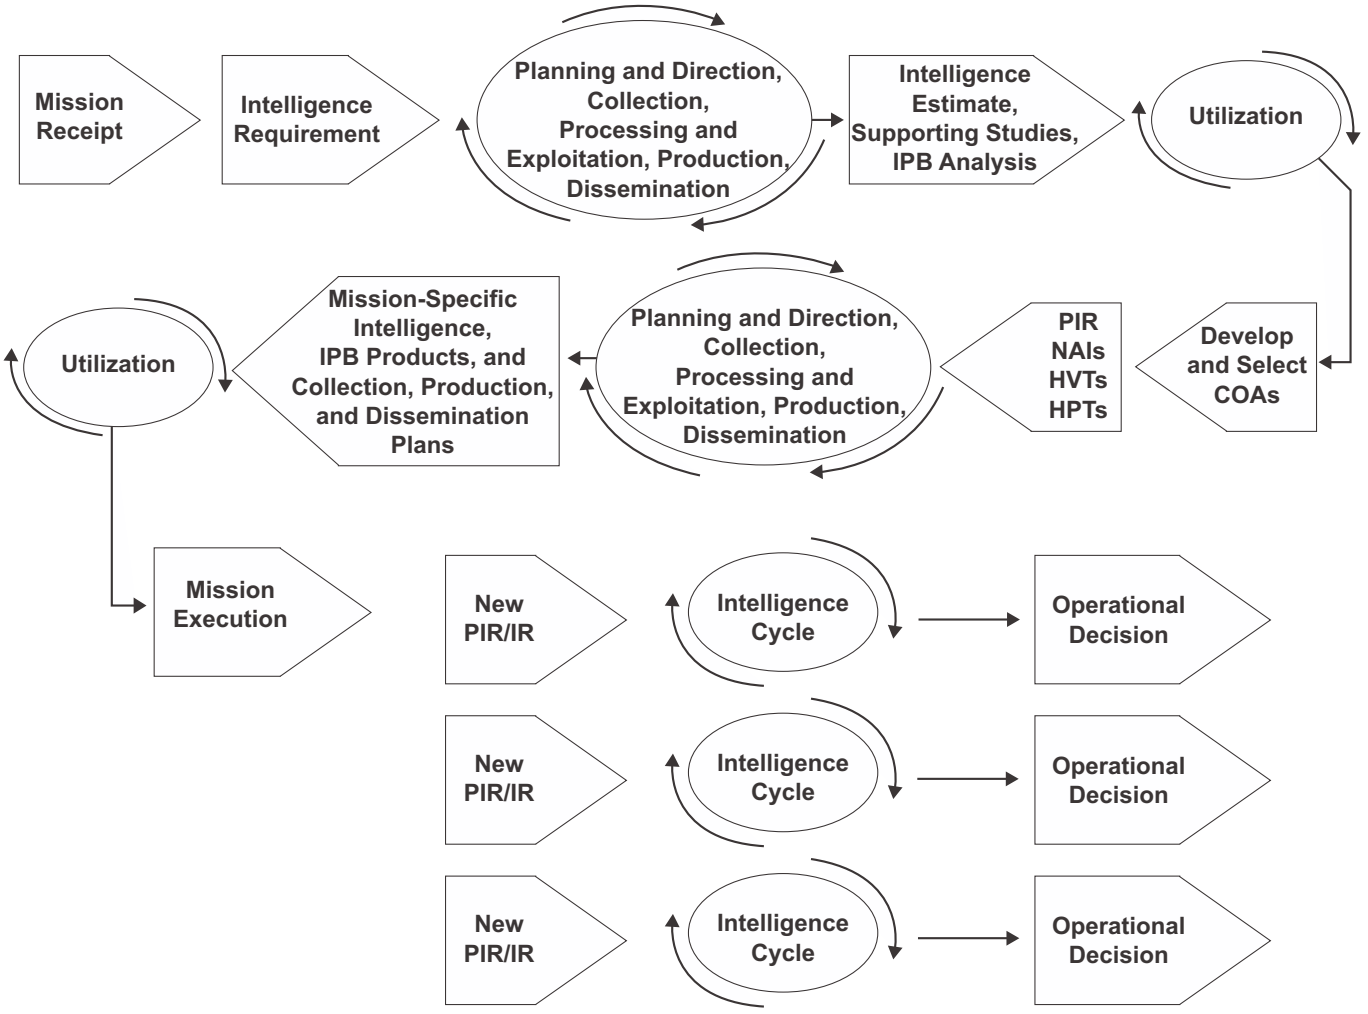

Figure 3-13. Application of the Intelligence Cycle.

CI measures to protect themselves from potential threats. The unit intelligence officer plans, implements, and supervises the CI effort for the commander. The G-2/S-2 may have access to or request support from MAGTF CI units and specialists to assist in developing CI estimates and plans. All members of the command are involved in executing the CI plan and implementing appropriate CI measures. Key participants in this process and their specific responsibilities follow:

- G-3/S-3-overall security and force protection, OPSEC, counterreconnaissance, and deception.
- G-6/S-6-CIS security.
- G-1/S-1-information security.
- Headquarters commandant-physical security of unit CP and echelons.

CI Planning

CI planning at all levels is conducted by using a standard methodology that consists of three steps: developing a CI estimate, conducting a CI survey, and developing the CI plan.

The CI Estimate

The CI estimate details the capabilities and limitations of foreign intelligence, subversive, and terrorist organizations that could carry out actions

against friendly units and facilities or against individuals, groups or locations of concern to our forces, such as the local population or civilian organizations operating in the area. It also provides an estimate of possible and probable COAs that these threat organizations will adopt. Intelligence and CI analysts of the MAGTF CE and CI/HUMINT company will normally prepare a comprehensive CI estimate that addresses threats to the MARFOR or MAGTF by using an IPB methodology that is focused on CI factors and the CI threat. However, each level of command must conduct its own evaluation to determine which of the adversary's capabilities identified in the MAGTF CI estimate represent a threat to their particular unit. The CI estimate must be updated on a regular basis. The revised estimate or appropriate CI warning reports must be disseminated to all units involved in the operation.

The CI Survey

The CI survey assesses a unit's security posture against the threats detailed in the CI estimate. The CI survey should identify vulnerabilities to specific foreign intelligence, espionage, sabotage, subversion or terrorist capabilities and provide recommendations on how to eliminate or minimize these vulnerabilities. The survey should be as detailed as possible. During the planning phase of an operation, it may be possible to do a formal, written survey. CI specialists from the CI/HUMINT company may be available to assist in this effort. In a time-compressed situation, the survey will likely result from a brief discussion between the appropriate intelligence, operations, communications, and security personnel. In either case, it is critical that the survey look forward in space and time to support developing the CI measures necessary to protect the unit as it carries out successive phases of the operation; i.e., the survey makes recommendations to improve the CI posture of the command for now and in the future.

The CI Plan

The CI plan details the activities and operations that the command will use to counter the CI threat. It includes procedures for detecting and monitoring the activities of foreign intelligence and terrorist organizations and directs the implementation of active and passive measures that are intended to protect the force from these activities. The CI plan is based on the threats identified in the CI estimate and the vulnerabilities detected by the CI survey. The MAGTF staff CI officer normally prepares a detailed, comprehensive CI plan that addresses the entire MAGTF. Included in the MAGTF CI plan are details of the employment of dedicated CI capabilities and the conduct of specialized CI operations intended to detect and neutralize or eliminate specific CI threats. Plans of subordinate MAGTF elements closely follow the MAGTF plan, normally adding only security measures that apply to their specific units. As with all plans, CI plans must be continually updated to ensure they are current and support ongoing and future operations.

CI Measures

CI measures encompass a broad range of activities designed to protect against the CI threat. The two general categories of CI measures are active and passive.

Active CI measures are those measures that are designed to neutralize or eliminate the foreign intelligence effort and adversary sabotage, subversion, and terrorism capabilities. Counterreconnaissance operations and deception activities are examples of active measures that are routinely employed by all units. Complex active CI measures such as counterespionage operations, counterterrorism operations, screening and interrogations, and CI force protection source operations are conducted only by CI personnel or other specialized organizations following the direction of the joint force and/or MAGTF commanders.

Passive CI measures are designed to conceal and deny information to foreign intelligence personnel and protect friendly personnel and installations from sabotage, subversion, and terrorism. Camouflage, security of classified material, emission control, information systems security, noise and light discipline, and physical access control are examples of passive CI measures that are employed extensively by all units.

The CI process is summarized in figure 3-14. For further details on CI responsibilities, planning, measures, and operations, see MCWP 2-14.

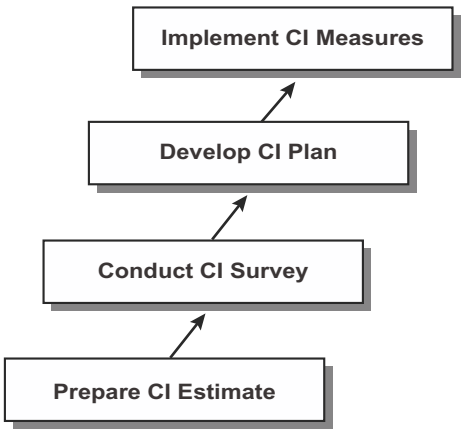

Figure 3-14. The Counterintelligence Process.

CHAPTER 4
CONCEPT OF MAGTF INTELLIGENCE SUPPORT

Marine intelligence operations are conducted primarily to facilitate the planning and execution of MAGTF operations through the development of tactical intelligence. The concept of MAGTF intelligence support ensures that the required intelligence is available to commanders at all levels throughout the force in time to influence their decisionmaking process. Key elements of this concept follow:

- Fully manned and capable organic intelligence sections down to maneuver battalion/squadron level.
- Directing the intelligence effort and maintenance of a robust collection, production, and dissemination capability at the MAGTF level.
- Employing specialized intelligence units to provide dedicated collection, processing, exploitation, and production of all-source intelligence.
- Creating key intelligence nodes at any level to concentrate intelligence support at critical times and locations. (These nodes are created through task organization, split-basing, and the use of intelligence direct support teams [DSTs].) An intelligence DST provides an enhanced intelligence capability to a supported intelligence section. A DST consists of one officer and several enlisted intelligence specialists. DSTs are organic to the MEF and each MSC G-2 sections.
- Full use of the intelligence support available from national, theater, joint, other Service component, and multinational forces to enhance MAGTF intelligence capabilities.
- Augmentation from global sourcing (noncommitted operating forces, the supporting establishment, and the Reserves) to enhance intelligence support to the MAGTF.

This intelligence support concept provides organic intelligence sections to commanders at all levels. These sections develop intelligence to satisfy their units' unique requirements. This intelligence supports their commander's tactical decisionmaking process and generates tailored intelligence products to facilitate mission execution.

Unit intelligence sections are supported by a primary MAGTF intelligence node that can perform all types of intelligence operations. The MAGTF G-2, through its combat intelligence center (CIC), provides centralized direction for the collection, production, and dissemination efforts of organic and supporting intelligence assets and ensures that these efforts remain focused on satisfying the PIRs that are essential to mission success. At the MEF CE level, the intelligence operations center (IOC) is the primary MAGTF intelligence node. Concentration of specialized intelligence capabilities in the radio battalion, the intelligence battalion, and the force reconnaissance company under this centralized direction facilitates unity of effort, effective employment of limited assets, and the collection and production of all-source intelligence.

The concept of intelligence support acknowledges the need to focus intelligence efforts in support of particular MAGTF elements during different phases of an operation. The MAGTF intelligence structure has the flexibility to provide such focused support through task organization. Enhanced support can be provided employing DSTs and integrating MAGTF intelligence assets.

Recognizing that organic intelligence capabilities may be limited in particular environments, the MAGTF can draw on the full range of national, theater, joint, other Service, allied, and multinational intelligence assets. When available, these capabilities will be fully integrated into MAGTF intelligence operations. If a separate Marine component

headquarters is established, it will support the MAGTF by performing those intelligence functions not directly related to warfighting, to include the following:

- Conducting detailed operational-level intelligence planning.
- Providing Marine intelligence liaison to joint task force (JTF) and other component intelligence elements.
- Monitoring the status of MAGTF intelligence collection and production requests for supporting and external support requirements.
- Planning the development and monitoring the adequacy of the JTF/MAGTF's intelligence architectures and the flow of intelligence to the MAGTF.
- Supporting Marine participation in intelligence support to the joint targeting process.

If a separate Marine component headquarters is not established, then the MAGTF CE's CIC will perform these functions. MSCs and other MAGTF elements will be able to access these external capabilities through the MAGTF intelligence architecture to pull available intelligence products on demand. Specialized intelligence units; e.g., the radio battalion or intelligence battalion, will have connectivity with appropriate external agencies to coordinate tasking or support.

Any MAGTF that is committed to an operation can be supported by intelligence assets of nondeployed MAGTFs, the supporting establishment or the Reserves. This support could consist of augmentation to fill shortfalls in manpower, equipment or specialized capabilities and assistance in developing intelligence in response to a Service-unique requirement. Flexibility to draw on assets from across the Marine Corps provides the ability to tailor and enhance particular intelligence capabilities based on the requirements of the committed MAGTF commander.

Role of the Organic Intelligence Section

Most commands from the battalion/squadron level and above in the operating forces have an organic intelligence section. The unit intelligence officer and section occupy the central role in the concept of MAGTF intelligence support. They focus the intelligence effort to develop, disseminate, and ensure effective use of intelligence in support of tactical operations. Intelligence drives operations and remains responsive to mission requirements through close and direct contact with the commander, key staff officers, and subordinate unit leaders.

The Unit Intelligence Officer

The commander directs the intelligence effort. The intelligence officer manages this effort for the commander, acting as the principal advisor on intelligence and implementing activities that carry out the commander's intelligence responsibilities. *The intelligence officer is a full participant in the commander's decisionmaking process, ensuring that intelligence is effectively used throughout the command during all phases of mission planning and execution*. Key responsibilities follow:

- Facilitate understanding and use of intelligence in the planning and execution of operations.
- Support situation development and the commander's estimate of the situation by identifying enemy capabilities, strengths, and critical vulnerabilities and opportunities and limitations presented by the environment.
- Assist the commander in developing PIRs.
- Ensure that the command's IRs are received, understood, and acted on by organic and supporting intelligence assets.
- Develop and disseminate all-source intelligence products that are tailored to the unit's mission and concept of operations.

- Monitor the effective flow of intelligence throughout the command.
- Provide BDA data and analysis to assist the combat assessment process.

The Unit Intelligence Section

The unit intelligence section supports the commander, the intelligence officer, and the entire command through the production and dissemination of mission-oriented intelligence products. Primary functions follow:

- Conduct IPB analysis for the unit's AO and interest.
- Develop and maintain a comprehensive intelligence estimate.
- Tailor intelligence produced at all levels to meet specific unit requirements.
- Form collection plans and support requests to satisfy unit PIRs and IRs.
- Maintain an accurate image of the battlespace and enemy situation.
- Prepare target analysis and target intelligence products.
- Recommend CI and force protection measures.
- Provide linkage to supporting intelligence assets.

Each organic intelligence section performs all six intelligence functions described in chapter 1. However, the priority and level of effort applied to the different functions will vary with the type of unit, level of command, and assigned mission. For example, an infantry battalion S-2 section will normally focus on support of the commander's estimate and situation development, while the S-2 of a combat service support (CSS) unit may concentrate on support of force protection, and the intelligence section of a fixed-wing Marine aircraft group usually places priority on support of targeting and combat assessment (particularly BDA).

Required Capabilities

To carry out these responsibilities, organic intelligence sections must have the following capabilities:

- Sufficient manning to carry out assigned responsibilities.
- Training in all aspects of tactical intelligence development, emphasizing the production of tailored, all-source, mission-specific intelligence products.
- Organic collection, processing, production, and dissemination assets appropriate to its mission and level of command.
- Connectivity to other MAGTF intelligence assets to provide a common picture of the battlespace, receive warning and other critical intelligence, and achieve access for "pulling" pertinent intelligence in response to unit requirements.
- Formation as a base for developing a larger intelligence support node, task-organized to provide expanded intelligence capabilities during particular phases of an operation.

The MAGTF Intelligence Section

The MAGTF intelligence section resident in the MAGTF CE is the focal point for intelligence operations and development in the MAGTF.

MAGTF Intelligence Officer

The MAGTF G-2/S-2, supported by the CIC and its subordinate sections, provides centralized direction for the MAGTF's comprehensive intelligence effort. The G-2/S-2 serves as the intelligence officer for the MAGTF commander. The CIC serves as the primary intelligence node for the entire MAGTF. As such, the CIC must remain responsive to the requirements of all MAGTF elements. The MAGTF intelligence section performs the following tasks:

- Provides centralized direction for MAGTF intelligence operations.

- Plans and implements a concept for intelligence support based on the mission, concept of operations, and commander's intent.
- Consolidates, validates, and prioritizes IRs of the MAGTF.
- Recommends MAGTF PIRs to the MAGTF commander.
- Maintains a consolidated, all-source production center in the MAGTF all-source fusion center (AFC).
- Plans, develops, and directs the MAGTF collection, production, and dissemination plans and operations.
- Directs the employment of MAGTF organic collection assets through the surveillance and reconnaissance cell (SARC) and the operations control and analysis center (OCAC).
- Submits consolidated requests for external intelligence support through the Marine component headquarters to appropriate agencies.
- Links the MAGTF to national, theater, joint, other Service, and multinational intelligence assets and operations.
- Prepares a comprehensive CI plan with recommended force protection measures.
- Supervises the execution of appropriate active and passive CI measures, CI functions, and CI services.

In addition to the responsibilities of all MAGTF intelligence officers, the MEF assistant chief of staff (AC/S) G-2 exercises staff cognizance over several special staff officers and their intelligence units/organizations. (See figure 4-1.)

The AC/S G-2 has staff responsibility for intelligence and intelligence operations. The commander relies on the intelligence officer to provide information on weather, terrain, and enemy capabilities, status, and intentions. Through the intelligence OPLAN and supporting intelligence, CI, and reconnaissance and surveillance (R&S) plans, the G-2 validates and plans information requirements; coordinates intelligence priorities, integrates collection, production, and dissemination activities; allocates resources; assigns specific intelligence and reconnaissance missions to subordinate elements; and supervises the overall intelligence, CI, and reconnaissance efforts. Specific responsibilities follow:

- Develop and answer outstanding MEF and subordinate units' priority information requirements and information requirements by planning, directing, integrating, and supervising organic multidiscipline MEF and supporting intelligence operations.
- Prepare appropriate intelligence, CI, and reconnaissance plans and orders for the MEF and review and coordinate the all-source intelligence CI and reconnaissance plans of JTFs, theaters, and other organizations.
- Submit and coordinate all-source collection, production, and dissemination requirements beyond the capability of the MEF to satisfy to higher headquarters for JTF, theater or national intelligence support.
- Ensure intelligence information is rapidly processed, analyzed, and incorporated where appropriate in all-source intelligence products, and rapidly disseminated to all MEF and external units requiring these.
- Evaluate JTF, theater, and national all-source intelligence support and adjusting stated IRs, if necessary.
- Identify and correct deficiencies in intelligence, CI, and reconnaissance personnel and equipment resources.
- Incorporate intelligence in training exercises to improve MEF individual, collective, and unit readiness.
- Facilitate understanding and use of intelligence in support of the planning and execution of MEF operations.

Special Staff Officers under the Staff Cognizance of G-2 Officer

G-2 Operations Officer

The G-2 operations officer has primary responsibility for intelligence support to the commanding officer and the remainder of the CE in support of

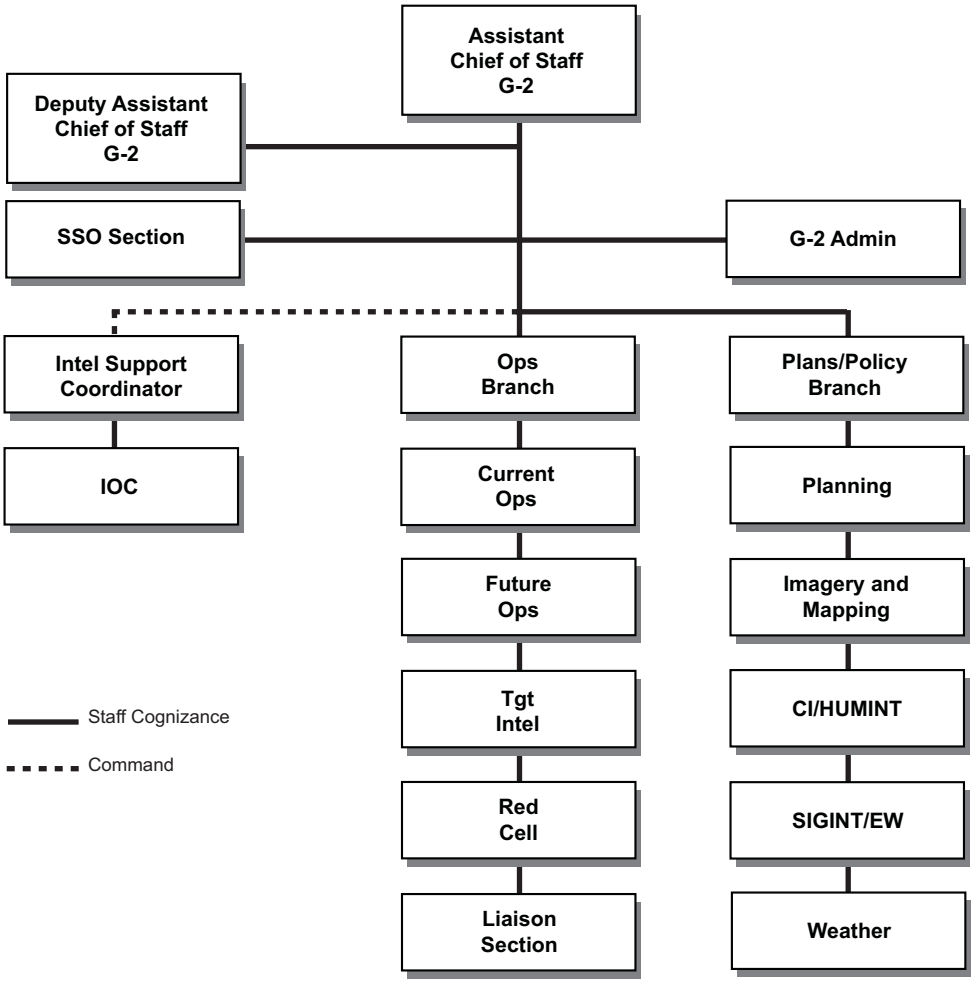

Figure 4-1. Special Staff Officers and Relationships under the Staff Cognizance of the MEF G-2.

current and future operations. Specific responsibilities include the following:

- Coordinate and provide intelligence support to the commander, the G-3 operations section, and the rest of the commander's battle staff.
- Serve as the G-2 representative to the MEF CE crisis action team.
- Coordinate, provide, and supervise intelligence support to the MEF CE current operations center, future operations center, and force fires.
- Plan, direct, and supervise the Red Cell.
- Provide recommendations on PIR and IR validation, prioritization, and taskings to the AC/S G-2 and the intelligence support coordinator (ISC). The intelligence battalion commander is dual-hatted as the ISC.
- Coordinate and supervise the transition of intelligence planning and operations from G-2 plans to G-2 future operations, and from G-2 future operations to G-2 current operations, to effectively support the MEF's "single battle" transition process.
- Plan, direct, and supervise MEF liaison teams to external commands; e.g., the JTF and joint

functional components headquarters, and intelligence organizations.
- Coordinate with the ISC and MEF MSCs' G-2 operations officers to ensure unity of effort of MEF intelligence operations.
- Provide intelligence input and other support to MEF warning and fragmentary orders and to operations related reporting; e.g., periodic situation reports.
- Coordinate intelligence training for the MEF G-2 section and providing G-2 oversight for and integration of the entire MEF intelligence training program.
- Perform other intelligence support and tasks as directed by the AC/S G-2.

G-2 Plans Officer

The G-2 plans officer has primary responsibility for intelligence support to the future plans cell. Specific responsibilities follow:
- Plan the MEF concept of intelligence operations for approval by the AC/S G-2 and subsequent implementation by the integrated staff cell based upon the mission, threat, commander's intent, guidance, and concept of operations.
- Lead, coordinate, and provide intelligence support to MEF G-5 future plans section.
- Plan and coordinate intelligence support requirements for and the deployment of intelligence elements and resources into the AO.
- Provide recommendations on PIR and IR validation, prioritization, and taskings to the AC/S G-2 and the ISC.
- Coordinate, in conjunction with the ISC, G-2 development of Annex B (Intelligence) and Annex M (Geospatial Information and Services) to MEF OPLANs.
- Keep the G-2 section, other CE staff sections, intelligence liaison personnel, augmentees, and others apprised of MEF intelligence planning actions and requirements.
- Identify requirements and provide recommendations to the G-2 operations officer for MEF intelligence liaison teams to external commands; e.g., the JTF or other components' headquarters and intelligence agencies.
- Coordinate and develop policies for MEF intelligence, CI, and reconnaissance operations.
- Plan, direct, and supervise the MEF G-2's imagery and mapping, CI/HUMINT, SIGINT, and weather sections.
- Perform other intelligence support and tasks as directed by the AC/S G-2.

Intelligence Battalion Commander/ Intelligence Support Coordinator

The intelligence battalion commander is responsible for planning, directing, collecting, processing, producing and disseminating intelligence, and providing CI support to the MEF, MEF MSCs, subordinate MAGTFs, and other commands as directed.

Garrison. In garrison the principal task of the intelligence battalion commander is to organize, train, and equip detachments that support MAGTFs or other designated commands to execute integrated collection, intelligence analysis, production, and dissemination of intelligence products.

During Operations. During operations the intelligence battalion commander is dual-hatted as the ISC, serving as such under the direct staff cognizance of the MEF AC/S G-2. The intelligence battalion's S-3 section, along with the operations center element of the MEF G-2, form the core of the ISC support effort, with planning, direction, and C2 conducted within the IOC's support cell. As the ISC, he is responsible to the MEF AC/S G-2 for the overall planning and execution of MEF all-source intelligence operations. Specific responsibilities of the ISC during actual operations follow:
- Implement the concept of intelligence operations developed by the G-2 plans officer and approved by the AC/S G-2.
- Establish and supervise operation of the MEF IOC, which includes the support cell, the

SARC, and the production and analysis (P&A) cell. Generally the IOC will be collocated with the MEF CE's main CP.

- Develop, consolidate, validate, and prioritize recommended PIRs and IRs to support MAGTF planning and operations. The ISC is tasked to perform PIR and IR validation and prioritization *only* during operations when the IOC is activated. During routine peacetime operations, the PIR/IR validation and prioritization tasks are the responsibility of the MEF CE's G-2 operations officer.
- Plan, develop, integrate, and coordinate MEF intelligence collection, production, and dissemination plans, to include the effective organic and external integration and employment and staff cognizance of MEF SIGINT, CI, HUMINT, geographic intelligence, IMINT, ground remote sensors, ground reconnaissance, and tactical air reconnaissance intelligence collections, production, and dissemination operations.
- Develop, in conjunction with the G-2 plans officer and G-2 operations officer, and complete Annex B (Intelligence) and Annex M (Geospatial Information and Services) to MEF operation orders (OPORDs).
- Plan, develop, integrate, and coordinate intelligence and CI support to the commander's estimate, situation development, I&W, force protection, targeting, and combat assessment.
- Manage and fuse the threat (or *red*) common operational picture (COP)/common tactical picture (CTP) inputs from subordinate units and external commands and intelligence agencies into the MEF CE's threat COP/CTP.
- Provide intelligence support to the MEF CE G-2 section and the MSCs.
- Prepare the intelligence and CI estimates to support G-2 plans.
- Plan, develop, and coordinate intelligence CIS architecture, to include its integration with and support of MEF IMINT and other intelligence and reconnaissance requirements.
- Coordinate and integrate all-source intelligence operations with other Service components, JTF joint intelligence support element (JISE), theater joint intelligence center (JIC) or joint analysis center, and national intelligence agencies and operations to include all aspects of intelligence reach back support.
- Assist with the evaluation and improvement of MEF all-source intelligence, CI, and reconnaissance operations.
- Perform other intelligence support and tasks as directed by the AC/S G-2.

Figure 4-2 is a summary of the principal responsibilities of the AC/S G-2's three principal subordinate staff officers.

Intelligence Support Coordinator

- Plan and execute intelligence operations to support all MEF IRs.
- Establish and direct the IOC (P&A cell, SARC, and support cell).
- IR management (collection, production and dissemination) validation, prioritization, and tasking per AC/S G-2 direction.
- Intelligence operations command of intelligence battalion and staff cognizance over SIGINT, CI, HUMINT, MASINT, IMINT, and air/ground reconnaissance (or designated G-2 elements).

G-2 Operations Officer

- Intelligence support to MEF CE battlestaff and current operations center agencies.
- Coordination and support to higher and adjacent headquarters and agencies.
- Recommends IR validation, prioritization, and tasking to AC/S G-2.
- Establish and direct intelligence elements and support to the current operations center, future operations center, target intelligence section, force fires, Red Cell, and MEF intelligence liaison teams.

G-2 Plans Officer

- Intelligence support to the G-5 future planning team for future planning IRs.
- Recommend IR validation, prioritization, and tasking to AC/S G-2.
- Establish and direct the G-2 future planning intelligence element.
- G-2 section's imagery & mapping, CI/HUMINT, SIGINT, and weather sections (less that under the staff cognizance of the ISC).

Figure 4-2. AC/S G-2's Principal Subordinate Staff Officers and their Responsibilities.

Collection Management/Dissemination Officer. The collection management/dissemination officer (CMDO) is sourced from the intelligence battalion's S-3 section and is a key subordinate to the intelligence battalion commander/ISC during operations. The CMDO is

responsible for formulating detailed intelligence collection requirements and intelligence dissemination requirements and tasking and coordinating internal and external operations to satisfy these. The CMDO receives validated PIRs and IRs and direction from the ISC, and then plans and manages the best methods to employ organic and supporting collection and dissemination resources through the intelligence collection and dissemination plans (tabs to Appendix 16, *Intelligence Operations Plan*, to Annex B.) The CMDO is also responsible for validating and forwarding national and theater intelligence collection requests from the MEF and MSCs typically using appropriate intelligence tools and TTP. He also is responsible for coordinating intelligence CIS requirements and maintaining awareness of available CIS connectivity throughout the MAGTF and with key external organizations.

During operations the CMDO works within the support cell. In coordination with the P&A cell officer in charge (OIC), the SARC OIC, G-2 operations officer, intelligence/reconnaissance commanding officers/OICs, and the MEF G-6, the CMDO is responsible to the ISC for the following tasks:

- Determine and coordinate the collection effort of PIRs/IRs that may be collected via intelligence, CI, and reconnaissance resources.
- Determine PIRs/IRs and prepare requests for intelligence that are beyond organic capabilities and prepare submissions to higher headquarters and external agencies for support.
- Recommend dissemination priorities, development of intelligence reporting criteria, and advise on and selecting dissemination means.
- Develop and coordinate all-source intelligence collection plans, coordinate and integrate these with MEF, other components, JTF, theater, and national intelligence production operations.
- Develop and coordinate all-source intelligence dissemination plans and supporting architectures for voice and data networked communications, and coordinate and integrate these with MEF, other components, JTF, theater, and national intelligence CIS and dissemination operations.
- Monitor the flow of intelligence throughout the MEF and ensure that it is delivered to intended recipients in a timely fashion and satisfactorily meet their needs.
- Evaluate the effectiveness of MEF and supporting intelligence collection and dissemination operations.

SARC OIC

The SARC OIC is also an immediate subordinate of the ISC and is responsible for supervising the execution of the integrated organic, attached, and direct support intelligence collection and reconnaissance operations. The SARC OIC is responsible to the ISC for accomplishing the following specific responsibilities:

- Coordinate, monitor, and maintain the status of all ongoing intelligence, CI, and reconnaissance collection operations. This includes—
  - Missions, tasked intelligence collection requirements, and reporting criteria for all collection missions.
  - Locations and times for all pertinent fire support control measures.
  - Primary and alternate CIS plans for routine and time-sensitive requirements for intelligence users (collectors, the SARC, and key MEF, CE, and MSC C2 nodes) to support ongoing C2 of collection operations and dissemination of acquired data and intelligence via the most expeditious means.
- Conduct detailed intelligence collection planning and coordination with the MSCs and intelligence, CI, and reconnaissance organizations' planners, with emphasis on ensuring understanding of the collection plan and specified intelligence reporting criteria.
- Ensure other MAGTF C2 nodes; e.g., the current operations center or force fires are apprised of ongoing intelligence, CI, and reconnaissance operations.

- Receive routine and time-sensitive intelligence reports from deployed collection elements; cross-cueing among intelligence collectors, as appropriate; and the rapid dissemination of intelligence reports to MAGTF C2 nodes and others in accordance with standing PIRs/IRs, intelligence reporting criteria and dissemination plan, and the current tactical situation.

P&A Cell OIC

The P&A cell OIC is the third principal subordinate to the ISC, with primary responsibility for managing and supervising the MEF's all-source intelligence processing and production efforts. Key responsibilities follow:

- Plan, direct, and manage operations of the AFP (to include the fusion, order of battle, IPB, and target intelligence/battle damage assessment teams), the topographic platoon, the IIP, the DSTs, and other P&A elements as directed.
- Coordinate and integrate P&A cell operations, estimates, and products with the MEF G-2 section's G-2 operations branch and its Red Cell operations and estimates.
- Maintain all-source automated intelligence databases, files, workbooks, country studies, and other intelligence studies.
- Plan and maintain imagery, mapping, and topographic resources and other intelligence references.
- Administer, integrate, operate, and maintain intelligence processing and production systems, unclassified general service and senstitive compartmented information systems; e.g., the intelligence analysis system or the image product library.
- Analyze and fuse intelligence and other information into tailored all-source intelligence products to satisfy all supported commanders' stated or anticipated PIRs and IRs.
- Develop and maintain current and future intelligence situational, threat, and environmental assessments and target intelligence based upon all-source analysis, interpretation, and integration.

Manage and fuse the threat COP/CTP inputs from subordinate units and external commands and intelligence agencies into the MEF CE's threat COP/CTP.

MAGTF Intelligence Units

The limited number of specialized intelligence assets, coupled with the requirement to integrate and focus intelligence operations on the satisfaction of the command's PIRs, creates the need for centralized management. Intelligence units whose capabilities support the entire MAGTF are employed in general support of the MAGTF with staff cognizance exercised through the G-2/S-2. Certain intelligence units are capable of performing operational tasks in addition to their primary intelligence functions. For example, a force reconnaissance team may carry out a laser target designation mission or a UAV may be used to assist in maneuver control. Likewise, radio battalion may support maneuver and fires through electronic attack operations. The MAGTF G-2/S-2 provides centralized direction for these assets and facilitates unity of effort, the production of all-source intelligence, and the effective use of limited resources in support of the requirements of the entire force. Direction is provided primarily through MAGTF-level intelligence C2 agencies; e.g., the SARC and the OCAC. Subordinate elements of the MAGTF retain organic intelligence assets and OPCON appropriate to their mission and level of command; e.g., division ground reconnaissance units remain under the OPCON of the division commander.

Organization of MAGTF-Level Intelligence Units

Radio Battalion

The radio battalion provides ground-based SIGINT, electronic warfare (EW), communications security

monitoring, and special intelligence communications capability to support MAGTF operations. In addition to directing the employment of its subordinate elements, the radio battalion is the focal point for MAGTF ground-based SIGINT operations. It plans and coordinates these activities through the OCAC.

Intelligence Battalion

The intelligence battalion plans, directs, collects, produces, and disseminates intelligence and provides CI support to the MEF, MSCs, subordinate MAGTFs and other commands as directed. This support is usually provided by a task-organized detachment sent to the supported command. Within the intelligence battalion is a headquarters company, a P&A company, and a CI/HUMINT company. (See figure 4-3.).

Headquarters Company

The headquarters company consists of a systems support platoon, collections platoon, and the GSP. The systems support platoon maintains the intelligence systems within the battalion in garrison and in the field should the battalion deploy. The collections platoon manages intelligence requirements for the battalion. The GSP is responsible for planning, controlling, and managing the employment of unattended ground remote sensor equipment in support of MAGTF operations or other commands as directed.

P&A Company

The P&A company consists of an AFP, a topographic platoon, and an IIP. The AFP provides fused intelligence to the supported MAGTF and

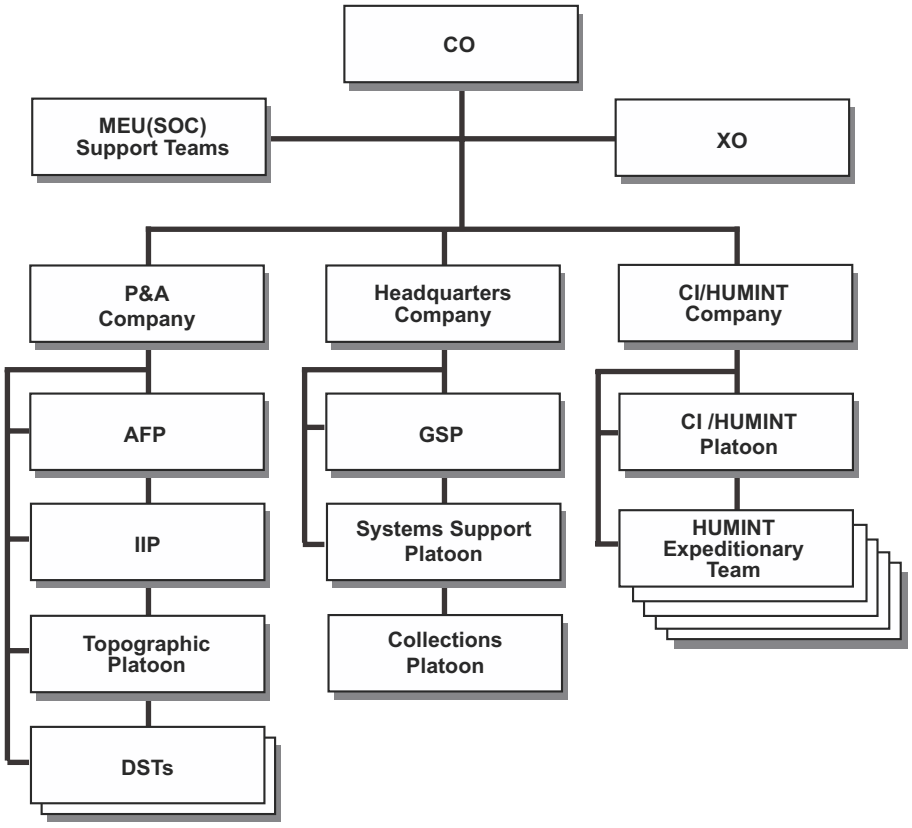

Figure 4-3. Intelligence Battalion.

assists MSC intelligence sections in providing situational awareness to their commanders and staff. The topographic platoon provides geographic intelligence products and services, geodetic and topographic surveys, and hydrographic analysis. The IIP provides imagery analysis support and dissemination to the MAGTF and other commands as directed.

CI/HUMINT Company

The CI/HUMINT company provides CI and HUMINT support to MAGTF operations. This support encompasses the full range of tactical CI and HUMINT operations, including screening operations, interrogation/debriefing of enemy prisoners of war and persons of intelligence interest, conduct of CI force protection source operations, conduct of CI surveys and investigations, preparation of CI estimates and plans, translation of documents, and limited exploitation of captured material. In addition, the CI/HUMINT company maintains a technical surveillance countermeasures team with equipment. CI/HUMINT Marines deploy as a task-organized HUMINT exploitation team (HET) in direct support of MAGTF's and subordinate elements.

Force Reconnaissance Company

The force reconnaissance company conducts preassault and deep postassault R&S in support of MAGTF operations. The company uses specialized insertion, patrolling, reporting, and extraction techniques to carry out amphibious and deep R&S tasks in support of the MAGTF. The company can perform a variety of other operational tasks. When a conflict exists between the requirements for R&S and other missions, the MAGTF commander determines the priority of tasking for the company based on recommendations from the G-2/S-2 and G-3/S-3.

Marine Unmanned Aerial Vehicle Squadron (VMU)

VMUs provide day/night, real-time imagery reconnaissance, surveillance, and target acquisition in support of the MAGTF. The unique capabilities of the UAV can also be used to support target engagement, assisting in the control of fires/supporting arms and maneuver. Squadrons are under the administrative control of the Marine aircraft wing (MAW). However, because of the limited number of assets and the critical capabilities they provide to the entire force, the MAGTF commander retains OPCON of the VMUs.

Employment of MAGTF Intelligence Units

MAGTF intelligence units are employed to meet the requirements of the entire force. The MAGTF G-2/S-2 develops a concept of intelligence support, which employs these units on the basis of the MAGTF mission, PIRs, concept of operations, and commander's intent. This concept must integrate intelligence activities with operations to provide key intelligence to commanders to enable rapid and effective decisionmaking. Based on the results of IPB analysis and the concept of operations, assets are positioned to satisfy PIRs, expose enemy vulnerabilities, monitor key locations, detect and assist in the engagement of targets, and identify opportunities as they arise in the battlespace.

Intelligence units are employed in either general or direct support. Under general support, units are tasked by the MAGTF commander through his G-2/S-2 to satisfy the requirements of the entire force. Because of the limited number of specialized intelligence assets and their ability to develop intelligence that is relevant to current and future operations in all areas of the battlespace (deep, close, and rear), general support is the preferred support relationship. Under direct support, the requirements of a supported commander are given priority. Direct support is used to focus intelligence support for particular phases of an operation or to create enhanced intelligence nodes in support of MAGTF subordinate elements. When MAGTFs smaller than a full MEF are deployed, they will normally be supported by

attached, task-organized detachments from the intelligence battalion, the force reconnaissance company, and the radio battalion.

Focused Intelligence Support

Intelligence must be integrated with the mission, commander's intent, and concept of operations and should normally be weighted to support the main effort. The MAGTF intelligence structure has the flexibility to tailor its capabilities to meet the requirements of various types of expeditionary operations and to adapt to changing operational needs during the execution. For each operation, the MAGTF G-2/S-2 will assess the IRs and develop a concept of intelligence support that positions assets where they can best satisfy those requirements. Intelligence nodes will be used to focus support within the MAGTF. Split-basing will be used to build intelligence nodes within and outside the AO to deliver comprehensive and reliable intelligence support while reducing the size of the deployed force. Intelligence units and DSTs are employed to tailor and enhance the capabilities of organic intelligence sections or to create task-organized intelligence nodes in response to specific requirements.

Intelligence Nodes

The MAGTF can create a series of intelligence nodes, thereby providing focused intelligence support to specific units or areas based on the tactical situation. In the concept of intelligence support, the MAGTF G-2/S-2, in conjunction with the MSC intelligence officers, task-organizes the MAGTF's intelligence units and uses intelligence DSTs to deliver the required intelligence capabilities at key points and times. Although these nodes normally support a specific unit, they can also be used in an area-support mode where an intelligence node is established to support all units operating in a particular sector of the battlespace. For example, during sustained operations ashore, an intelligence node could be built to support units operating in the MAGTF's rear area. Such a node could be built around a DST and specialists from the CI/HUMINT company and topographic platoon. This node might support the rear area operations center, CSSE units operating in the area or any security detachments located within the node's area of responsibility.

Split-basing

Intelligence nodes can also be used to tailor the footprint of the intelligence organization within and outside of a designated AO. Intelligence assets are positioned where they can best carry out their assigned functions. In many cases, it may not be necessary or desirable to forward deploy the entire MAGTF intelligence structure. The concept of operations, C2 support system, physical space limitations, and resource and/or logistical or other constraints may require the split-basing of intelligence assets.

Split-basing is the positioning of critical capabilities within the AO to support the deployed commander and forces, while maintaining in-depth intelligence management, processing, exploitation, analysis, and production elements in rear areas, intermediate support bases, staging areas or garrison locations. Split-basing enables reach back capabilities and can enhance the intelligence effort by providing continued access to sophisticated, nondeployable intelligence capabilities and resources. At the same time, it reduces the footprint of the deployed force, diminishing risk from enemy action and decreasing the administrative and logistic support requirements.

Split-basing is especially useful—

- When operations are conducted in areas with minimal infrastructure and support.
- When there are limitations on the number of personnel who can be deployed within the operating area.

- During the deployment phase when it may not be possible to immediately move all required elements of the intelligence structure to the forward area.

However, the advantages of split-basing must be assessed against its costs, particularly its critical dependence on responsive and reliable communications support.

Task Organization of Intelligence Support Units

Task organization of intelligence support units is one of the principal means for the MAGTF commander to shape the intelligence effort. The collection, exploitation, and unique production capabilities of specialized intelligence units significantly enhance the ability of supported G-2/S-2 sections to develop timely, mission-focused intelligence.

Intelligence battalion, force reconnaissance company, and radio battalion elements are task-organized to provide tailored intelligence capabilities. Specific capabilities provided are based on the threat, the supported unit's anticipated requirements (as determined through IPB), and the concept of operations. Elements from some or all of the intelligence battalion's subordinate companies are combined into intelligence battalion detachments. The CI/HUMINT company provides HETs. The radio battalion forms task-organized SIGINT support units (SSUs), which provide a mix of SIGINT and EW capabilities.

When MAGTFs smaller than a full MEF deploy, an intelligence battalion detachment, a HET, force reconnaissance platoons, and a radio battalion SSU will normally be attached to the MAGTF CE. In MEF operations, when the entire radio battalion, intelligence battalion, and force reconnaissance company are employed, detachments, HETs, SSUs, and platoons may be placed in direct support as required to provide tailored intelligence capabilities or to create an enhanced intelligence node in support of an MSC or other MAGTF element.

Intelligence DSTs

Intelligence DSTs are organic to the intelligence battalion and each of the division, MAW, and force service support group G-2 sections. Teams are made up of one officer and several enlisted personnel who have a mix of intelligence specialty skills. DSTs are used to provide an enhanced analytical and dissemination capability to a unit intelligence section and to link the intelligence structure to the supported units. As assigned by the G-2, they augment the supported unit's intelligence section to carry out the following tasks:

- Perform P&A in support of future operations.
- Tailor AFC and other external source intelligence products to the needs of the supported commander.
- Assist in the management of external intelligence support requirements.
- Facilitate dissemination of intelligence received from external sources.

The MEF and MSC G-2s use their DSTs to tailor and focus intelligence support to units designated as the main effort or to create enhanced intelligence nodes at key times and places in the battlespace.

Intelligence Coordination

Establishing and supervising operation of the MEF IOC, which includes the support cell, the SARC, and the P&A cell, requires a high degree of coordination at all levels. Generally the IOC will be collocated with the MEF CE's main CP. See figure 4-4 on page 4-14 for the basic IOC organization.

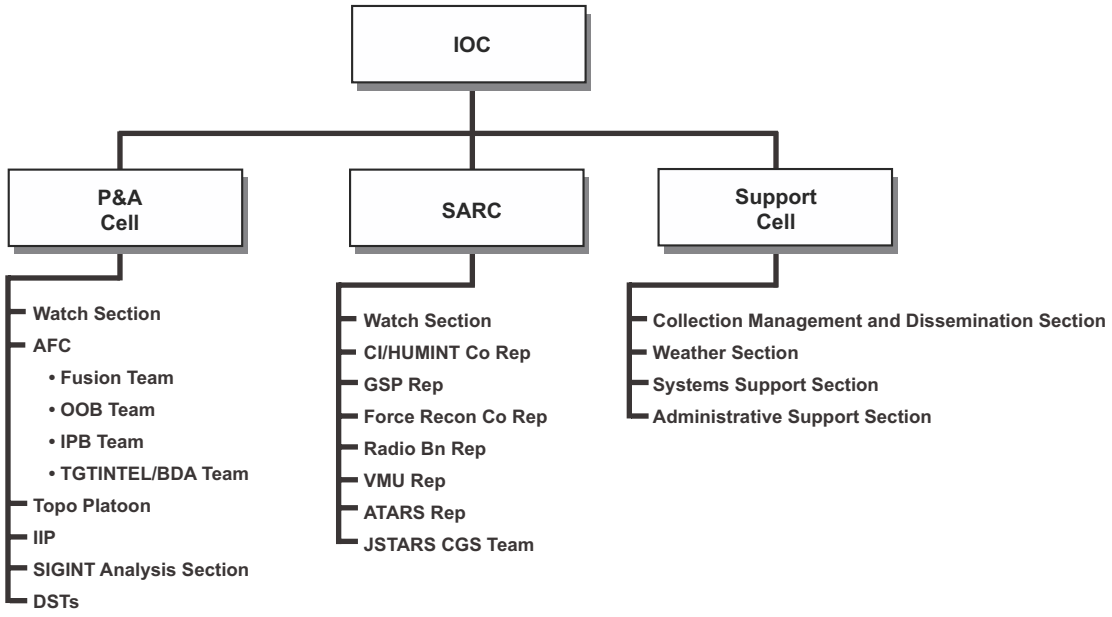

Figure 4-4. Intelligence Operations Center.

External Intelligence Support to the MAGTF

MARFOR Component Intelligence Section

Future military operations will normally be joint operations and may require establishing a MARFOR component headquarters. The Marine component is the level of command that deals directly with the JFC—the theater combatant commander or JTF commander—for MARFORs assigned to combatant command or the JTF. The Marine component functions at the operational level of war to advise and assist the JFC in employing MARFORs while supporting the MAGTF. The Marine component commander coordinates operational actions with the JFC and the other component commanders so that the MAGTF commander can concentrate on warfighting.

Responsibilities

The Marine component intelligence section plays a crucial role in supporting the component commander and staff and in providing intelligence support to the MAGTF. The Marine component supports and enhances the planning and execution of MAGTF intelligence operations through close and continuous coordination with the JFC, joint force headquarters, and other component intelligence organizations. The Marine component G-2 section maintains situational awareness and provides a limited analytical capability to support the component future planning responsibility. It does not normally conduct collection operations or engage in detailed, formal intelligence production. It facilitates, but does not control, the flow of intelligence to the MAGTF. The component relieves the MAGTF commander of intelligence functions that are not directly related to warfighting.

Functions

The size of the Marine component G-2 section will vary with the size of the JTF and the scope of the operation. For major joint operations, the Marine component intelligence section provides the following functions:

- **Planning.** The intelligence section plans and coordinates component and MAGTF connectivity to national, theater, and JTF intelligence architectures. The Marine component develops the architecture to provide the MAGTF with timely, tailored national and theater intelligence. The component G-2 coordinates the provision of additional Service intelligence support (units, personnel, and equipment) to the MAGTF through the Service chain of command.
- **Collection management.** The intelligence section monitors the status of MAGTF collection requests for supporting and external collection resources. The MARFOR leverages joint and national collection resources in support of the MAGTF. It advocates Service component and MAGTF requirements in theater and JTF collection forums and recommends the allocation and tasking of national, JTF, and other component assets to meet MAGTF requirements.
- **P&A.** The intelligence section provides situational awareness to the component commander and staff and limited P&A to support the future planning responsibilities of the component headquarters. This function requires the establishment of a watch section and an analytical element that can tailor operational-level intelligence products to satisfy the needs of component planning cells. The component G-2 monitors the status of and coordinates support for MAGTF production requirements and requests for intelligence that are submitted to joint force or supporting intelligence agencies.
- **Dissemination.** The intelligence section monitors the adequacy of the intelligence architecture and the flow of intelligence to the MAGTF. Intelligence is disseminated directly to the appropriate MAGTF elements, not through the component headquarters unless specifically required. However, the MARFOR facilitates and accelerates the flow of critical intelligence to the MAGTF. The component intelligence section remains aware of current MAGTF requirements and ensures that intelligence that is developed or received by the theater or JTF that can satisfy those requirements is disseminated to the MAGTF.
- **Support of targeting.** The intelligence section supports Marine component participation in the joint targeting process, including representation at various joint target intelligence and/or targeting forums as required. Performing this function ensures that MAGTF target intelligence collection and production requirements as well as collection requirements for support of combat assessment/BDA are adequately supported.

Liaison

The intelligence section provides liaison elements and personnel augmentation to various JTF and other component intelligence organizations. Liaison elements may be provided to the following:

- JISE.
- Other Service or functional component intelligence sections.
- The regional SIGINT operations center.
- The joint force J-2 CI/HUMINT staff element.
- The HUMINT operations cell.
- Task force CI coordinating authority, other joint intelligence organizations such as the joint interrogation and debriefing center or the joint document exploitation center.
- The intelligence elements of various alliance or coalition partners.

Liaison teams or personnel augmentation may be sourced from the Marine component G-2 section, Service augmentation to the component G-2 section, the MAGTF, or some combination of the above.

National, Theater, Joint, and Other Service Intelligence Support

Marine Corps intelligence assets are optimized for the production of tactical intelligence in support of MAGTF operations. National, theater, joint, and other Service intelligence assets provide unique capabilities that are not duplicated in the MAGTF intelligence support structure. (See figure 4-5.) The MAGTF has the ability to use external intelligence assets to enhance its organic capabilities, bringing the full range of these resources to bear on MAGTF requirements. The following are key external capabilities that support MAGTF operations:

- National- and theater-level intelligence analysis and production.
- Geospatial information and services (GI&S). GI&S describes the collection, production, and dissemination of information about the earth, and replaces the term mapping, charting, and geodesy.

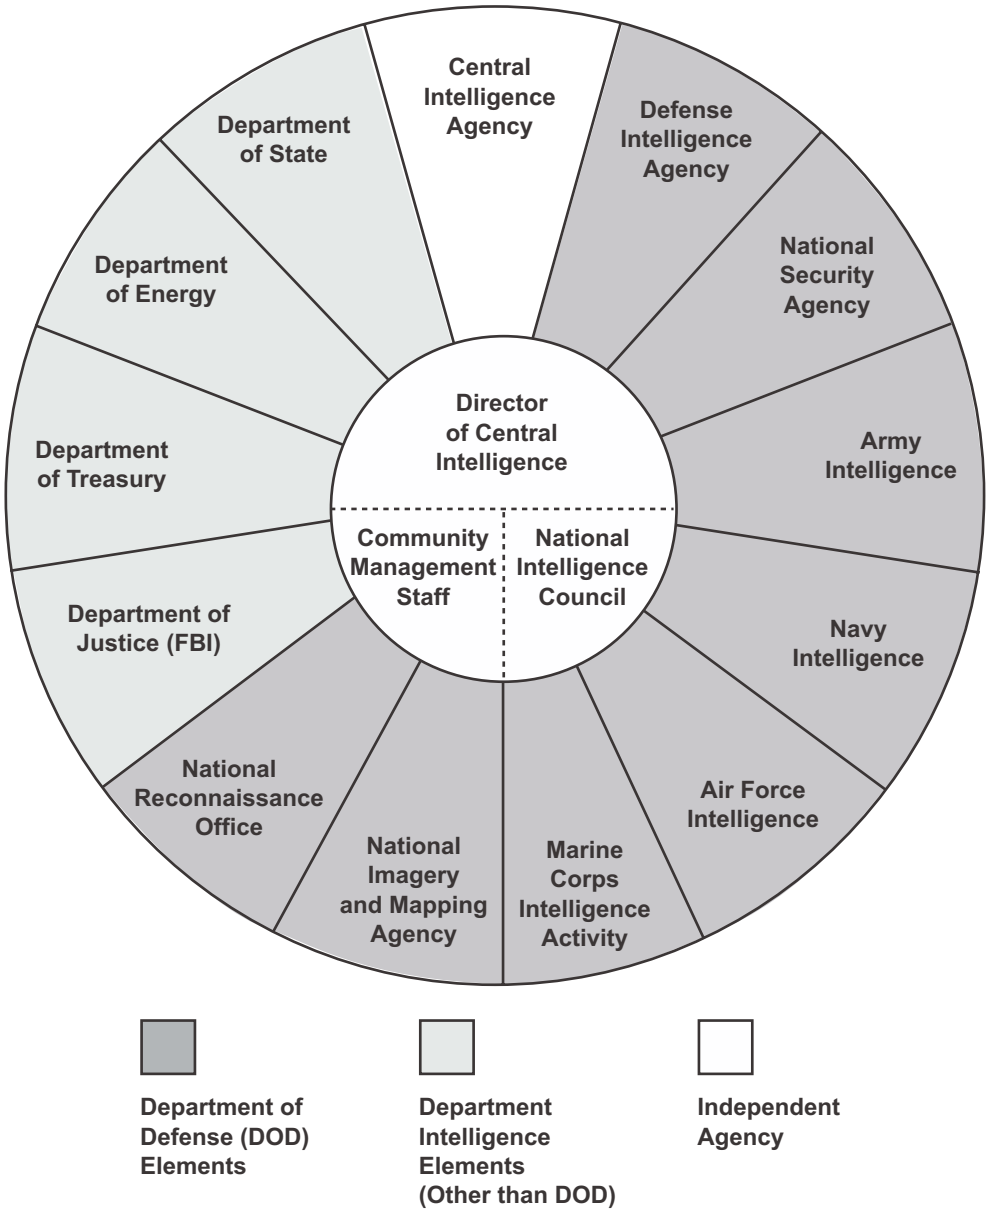

Figure 4-5. The National Intelligence Community.

- Analysis and production of target intelligence and target materials.
- National imagery collection and exploitation.
- SIGINT support from the National Security Agency and the US Cryptologic System.
- National- and theater-level CI and HUMINT collection.
- Liaison elements from national and theater intelligence agencies.

MAGTF Access to External Support. The Marine component headquarters or the MAGTF intelligence section will be the focal point for all external intelligence support to the MAGTF. In major joint operations, a Marine Service component headquarters will be established, and the component G-2 performs this function. When no Service component headquarters is established, the MAGTF acts in this role. Intelligence derived from external sources is used to build a common picture of the battlespace and is incorporated into other intelligence products that are provided to all MAGTF elements. MSCs and other subordinate units will be able to access external intelligence support resources through the MAGTF's intelligence architecture.

Required Capabilities

The following capabilities are required to fully use the resources of external intelligence support assets:

- Personnel trained and experienced in the capabilities, limitations, tasking, and employment procedures of external intelligence support assets.
- Sufficient, reliable CIS connectivity and interoperability with national, theater, and other Service intelligence C2 centers and architectures.
- The ability to receive, process, and disseminate information gathered by national and theater collection assets.
- Integrating Marine intelligence specialists into national, theater, and Service intelligence organizations to articulate Marine Corps capabilities and requirements and to optimize intelligence support to expeditionary forces.
- Establishing liaison between the MARFOR/MAGTF and supporting intelligence agencies through dedicated communications and the exchange of liaison officers.

Augmentation

Like all MAGTF components, intelligence support assets are flexible and respond to a variety of operational missions. They are configured for rapid deployment and can be tailored to meet the requirements of a particular operation. Although each MAGTF is furnished with a baseline intelligence capability to accomplish its anticipated mission, changes in the situation or mission tasking may require augmentation. When a MAGTF is committed to an operation, the intelligence assets of any remaining units in the operating forces can be called on to provide this augmentation. MAGTFs smaller than a MEF will normally be supported by their parent MEF; a fully deployed MEF can be augmented by the assets of any other MEF. Augmentation may consist of providing entire intelligence units, selected equipment or individual personnel with specialized skills. Support may also consist of providing intelligence products that cannot be developed by the deployed MAGTF or its supporting joint intelligence activity.

Supporting Establishment

Marine intelligence personnel and organizations of the supporting establishment enhance and sustain the intelligence activities of the operating forces.

Marine Corps Intelligence Activity

The Marine Corps maintains a Service-level intelligence capability in the Marine Corps Intelligence Activity (MCIA). MCIA focuses on crisis and predeployment support to expeditionary warfare. It complements the efforts of theater, other Service, and national intelligence organizations. It provides

unique threat, technical, and geographic intelligence products that are tailored to Marine Corps operating forces preparing for deployment. It also coordinates Marine Corps Service collection, production, and dissemination requirements by acting as the Service collection, production, and dissemination manager. MCIA is collocated with the National Maritime Intelligence Center, Suitland, MD and at Marine Corps Base, Quantico, VA.

Marine Cryptologic Support Battalion

The Marine cryptologic support battalion provides Marine Corps participation in national and Department of the Navy cryptologic activities worldwide. These Marines perform tasks that are directly related to their military occupational specialty, contributing to the national, theater, and Department of the Navy SIGINT collection, production, and dissemination effort while gaining invaluable skill maintenance and enhancement opportunities. The battalion is collocated with the Naval Security Group, Fort Meade, MD and augments the operating forces with trained SIGINT personnel during crises and exercises.

Navy Marine Corps Intelligence Training Center

The Navy Marine Corps Intelligence Training Center (NMITC), Dam Neck, VA trains Navy and Marine Corps personnel in basic, intermediate, and advanced intelligence methods and applications. During contingency operations, NMITC supports the operating forces through the provision of intelligence training via mobile training teams and/or selective personnel augmentation.

Personnel Augmentation

The supporting establishment is also a source of experienced intelligence personnel who can be called on to fill contingency billets in the intelligence structure of a deploying or committed MAGTF.

Marine Corps Forces Reserve

The mission of Marine Corps Forces Reserve is to provide trained units and/or personnel to augment, reinforce or reconstitute active duty MARFORs during times of war or national emergency. Intelligence capabilities of the Marine Corps Reserve are complementary to those of the active component. This includes individual mobilization augmentee and individual ready reserve personnel and selected Marine Corps Reserve units (including two force reconnaissance companies), a GSP, an imagery interpretation unit, and several interrogator-translator and CI teams, which provide increased depth to limited active component capabilities.

Individual mobilization augmentee members of the Marine Corps Reserve Intelligence Program and the Marine Corps Reserve Cryptologic Program routinely support the training and operational activities of the active component.

CHAPTER 5
OPERATIONAL MANEUVER FROM THE SEA

OMFTS is the maneuver of naval forces at the operational level that projects sea-based power ashore to deal a decisive blow. OMFTS is a bold bid for victory that aims to exploit a significant enemy weakness. It embodies the application of the principles of maneuver warfare to a maritime campaign. Success in OMFTS depends on the ability to seize fleeting opportunities and quickly take advantage of exposed enemy vulnerabilities. See MCDP 1-0, *Marine Corps Operations*.

OMFTS relies on intelligence to drive planning, option selection, and maneuver execution. To support OMFTS, intelligence operations must be conducted across the strategic, operational, and tactical levels of war. Starting with strategic considerations and working down to tactical dispositions, intelligence uncovers the threat's COG, strengths, and weaknesses, thereby exposing critical vulnerabilities to be exploited by naval forces operating from the sea. Intelligence also assesses the potential for maneuver offered by the battlespace, including identifying entry points where the force can establish itself ashore. The term entry point encompasses beaches, boat landing sites, HLZs, and drop zones that can establish elements of the force ashore. Intelligence also provides the foundation for effective force protection and IO efforts. These efforts help surprise, preempt, disrupt, and disorient the enemy during OMFTS execution.

Required Intelligence Capabilitites

- Perform IPB and situation development covering a broad maneuver space.
- Analyze threat forces to determine COG and critical vulnerabilities.
- Conduct detailed terrain and hydrographic analysis to identify suitable entry points.
- Ensure connectivity and interoperability with national, theater, and joint forces' intelligence assets, which provide intelligence support before the arrival of naval forces in the objective area.
- Provide stand-off collection assets that can satisfy force requirements from over-the-horizon.
- Provide organic imagery, SIGINT, HUMINT, CI, remote sensor, GI&S, and ground and aerial reconnaissance assets that can satisfy MAGTF tactical collection requirements as the force transitions ashore.
- Provide responsive processing, exploitation, and production capabilities that can rapidly develop the critical intelligence required to support timely decisionmaking.
- Provide dissemination systems that link widely dispersed forces afloat and ashore.
- Provide flexible intelligence units and organizations that can rapidly transition ashore with minimal degradation of support.
- Provide in-depth support to force protection and information operations activities.

Planning and Direction

There are a number of unique intelligence considerations for OMFTS. (See figure 5-1 on page 5-2.) During the planning phase, the MAGTF intelligence officer provides centralized direction for the intelligence efforts of the entire MAGTF. Navy and Marine intelligence assets operate together from an afloat amphibious force intelligence center, which is normally located on the amphibious force flagship. Initial requirements are broad in scope and are aimed at providing a general description of the battlespace and the threat. As planning progresses, requirements become increasingly focused on uncovering critical vulnerabilities and providing

intelligence that is relevant to the COAs under consideration. The intelligence flow will be predominately from the top down—from national and theater activities—until organic naval intelligence capabilities can be brought to bear. A comprehensive, systematic management effort is required to ensure that the necessary support is requested and received. At the same time, Navy and Marine intelligence officers must also develop detailed plans for the positioning and employment of the organic intelligence assets to support the concept of operations.

Intelligence Cycle	Key Considerations
Planning and direction.	Centralized direction from ATFIC. Transitioning of key capabilities ashore.
Collection.	Initial dependence on national/theater capabilities. Employment of organic assets in advance force/ preassault operations.
Processing, exploitation, and production.	Broad-based effort focusing on entry points and enemy vulnerabilities. Extensive support to CI and IO.
Dissemination.	Widely dispersed units afloat and ashore. Need for rapid intelligence flow to exploit fleeting opportunities.
Utilization.	COA selection shaped by intelligence. Choice of entry points, objectives, and targets driven by intelligence.

Figure 5-1. Intelligence Considerations During OMFTS.

Collection

Collection operations in the planning phase are conducted primarily by national and theater assets. These assets can collect information in denied areas without compromising operational security and/or perform their missions at significant stand-off distances. However, the small number of these systems and inherent limitations on their capabilities normally result in developing an incomplete intelligence picture. Advance force or preassault collection operations by naval assets will often be required to confirm and further develop the situation. An intensive intelligence effort must be provided in support of advance force or preassault operations; this intelligence support is required to select the proper targets for advance force or preassault collection operations, and ensure that these activities do not reveal the intent of the overall operation.

Processing, Exploitation, and Production

Initial production efforts are directed at providing an extensive description of the battlespace and threat. This description is required to focus the planning effort. Under the direction of senior Navy and Marine intelligence officers, the MAGTF, GCE, ACE, CSSE, Navy amphibious staff, and flagship intelligence sections engage in a cooperative effort to develop intelligence products that support the entire force. Individual intelligence sections will normally concentrate on their particular areas of expertise, thereby satisfying their units' requirements while contributing a broad-scope product to the general intelligence production effort. For example, the MAGTF G-2/AFC may focus on describing the battlespace and the enemy's C2, logistics, and reserves, while the GCE studies enemy ground forces, the ACE looks at the air and air defense threats, and the flagship intelligence department concentrates on the naval and coastal defense threat. From this effort, the ATFIC provides a comprehensive IPB analysis, an intelligence estimate, and supporting intelligence studies and products. As the planning phase continues, production efforts concentrate on identifying enemy vulnerabilities to be exploited and providing estimates and other intelligence products to support the specific COAs that are under consideration.

In the final stages of the OMFTS planning process, the production effort shifts to developing mission-specific intelligence products that focus on the selected COAs. These products include

IPB graphics, beach and HLZ studies, and target/objective area studies. An extensive all-source intelligence effort is conducted to support deception, OPSEC, psychological operations (PSYOP), and EW planning in accordance with the MAGTF commander's overall IO strategy. During this stage, the production effort becomes increasingly decentralized as GCE, ACE, and CSSE intelligence sections focus on specific requirements of their units. The MAGTF intelligence section continues to provide products to support the entire force, with efforts concentrated on those MAGTF elements designated as the main effort.

Dissemination

Dissemination in OMFTS presents significant challenges. Naval forces can be widely dispersed and may not assemble until late in the planning phase, if at all. Advances in technology have improved the capability to disseminate information between forces afloat, but there continue to be limitations on the quantity and quality of intelligence that can be exchanged. In particular, dissemination systems will be taxed by the volume of intelligence products, especially critical graphic products that must be distributed during the planning phase. Intelligence officers at all levels, working in coordination with unit operations and CIS officers, must develop plans that provide for dissemination of key intelligence in a timely manner to all elements of the MAGTF. They must be particularly careful to include in these plans units located on ships that are not equipped with the latest C2 or intelligence systems.

Utilization

During the planning phase, intelligence is used to develop and select COAs and prepare detailed plans for implementing the selected COAs. After providing an initial orientation to the battlespace and the threat, the intelligence officer assists the commander and the staff in analyzing the enemy's strengths and weaknesses to identify COG and critical vulnerabilities that can be exploited. COAs are developed that take advantage of identified weaknesses to accomplish the assigned objective. The intelligence effort is refined on the basis of the COAs under consideration, providing answers to IRs generated during COA development. The intelligence developed through this interactive process aids the commander in selecting a favorable COA. Once the COA is chosen, intelligence shapes the concept of operations and supporting plans. Designation of objectives; selecting entry means, points, and times; and identifying targets are all based primarily on intelligence. Particular attention is given to steps that preserve surprise and that preempt, disrupt or disorient the enemy's response to our actions; e.g., force protection measures, and IO (including, but not limited to, physical destruction, military deception, OPSEC, PSYOP, and EW) plans.

Planning and Direction

The ATFIC will continue to act as the central node for the direction of the intelligence effort. As the operation unfolds, intelligence nodes can be established ashore to support units carrying out mission tasking. Depending on the nature and scope of the operation, most of the MAGTF intelligence structure can remain afloat or all of it may transition ashore. Movement of significant portions of the MAGTF intelligence structure ashore must be planned in detail to ensure a rapid transition with minimal degradation of support capability. If it is fully established ashore, the MAGTF intelligence section becomes the central node for intelligence direction. The ATFIC acts in a supporting capacity and continues to provide connectivity and services that cannot be readily established ashore.

IRs that arise during execution are normally time sensitive. Intelligence direction must anticipate these requirements and establish a responsive collection, production, and dissemination structure to satisfy them. Designation of PIRs that are based on the results of IPB analysis, the commander's intent, and the concept of operations is critical. Using these factors to designate PIRs ensures that the intelligence effort remains focused on providing key intelligence to decisionmakers in a timely manner.

Collection

Collection operations transition from depending on national and theater capabilities to relying primarily on organic assets. Collection activities are integrated with the concept of operations. The objective is to develop the intelligence required to make key decisions regarding maneuver, targeting, and future plans. Collection assets are focused on key areas that are associated with the scheme of maneuver, location and development of critical targets, and combat assessment. Reports of units maneuvering through the battlespace and/or in contact with the enemy are a significant source of information. This information must be transmitted to the appropriate intelligence section to help maintain situational awareness and refine the threat assessment. The MAGTF continues to employ national and theater-level collection support against targets located deep in the area of influence, throughout the area of interest, and against less time-sensitive requirements.

Processing, Exploitation, and Production

Rapid processing and production of intelligence are emphasized to support timely decisionmaking. OMFTS depends on decisive action and generating rapid operational tempo to break the enemy's cohesion and ability to resist. Intelligence sections must demonstrate the flexibility, agility, and responsiveness to quickly recognize enemy vulnerabilities and identify opportunities as they develop during the battle. To do this, intelligence sections at all levels must be aware of ongoing tactical activities and potential enemy reactions. They must be able to rapidly integrate all-source intelligence information with sensor data and combat reporting to develop and maintain a coherent picture of enemy dispositions and an assessment of enemy intentions. They must be able to convey this picture and assessment (preferably in graphic form) to commanders in time to exploit identified opportunities. In addition to supporting the ongoing battle, intelligence sections must also be fully engaged in planning for future operations (continuing IPB analysis, delivering combat assessment inputs and BDA results, satisfying new IRs, and participating in the decisionmaking process).

Dissemination

Dissemination is an even greater challenge during OMFTS execution than during planning. Intelligence developed during the processing, exploitation, and production step must be rapidly disseminated to the units that are able to act on that intelligence. These forces may be widely dispersed afloat, airborne, and ashore while engaging in rapid maneuver and contact with the enemy. The dissemination system must be flexible and reliable and focus on the importance and quality of the intelligence distributed rather than on its volume. Dissemination plans must provide alarm channels for warning data and must ensure that pathways remain open for passing critical intelligence that directly affects PIRs or identified decision points. Measures that can help to reduce the volume of intelligence traffic follow:

- Limit routine reporting.
- Set filters to eliminate information that is not pertinent to the tactical situation.
- Establishing minimal reporting thresholds for the generation of intelligence reports.
- Providing alternate means for collection and other intelligence support requests.

Dissemination plans must permit two-way dissemination, providing a means for subordinate

elements to pass along data, information or intelligence that they collect or develop that identifies new enemy vulnerabilities or enhances situation development for the entire force.

Utilization

Utilization of intelligence during the execution of OMFTS is rapid and decentralized. Intelligence identifies enemy vulnerabilities as the battle unfolds.Once developed, this intelligence is quickly disseminated to the MAGTF elements that can act on it, thereby enhancing the ability of individual units to exploit opportunities as they arise. Through integration with operations, assets are positioned to develop new intelligence as the concept of operations is carried out and the enemy responds. Timely collection, analysis, and dissemination of intelligence provides commanders with an accurate picture of the battlespace and the ability to recognize new opportunities as they arise. Commanders use this intelligence to select branches and sequels to the COA, attack targets, protect their own forces, assess the results of their actions, and plan future operations.

CHAPTER 6
SUSTAINED OPERATIONS ASHORE

Sustained operations ashore require broad-based intelligence support that bridges the operational and tactical levels. Tactical plans are based on the results of operational-level intelligence assessments, which identify the enemy's COG and critical vulnerabilities throughout the theater of operations. MAGTF intelligence operations contribute to the operational-level assessments while translating the conclusions from these assessments into relevant tactical intelligence. Considerations for developing intelligence in support of sustained operations ashore are similar to those for OMFTS. Intelligence support during the execution of sustained operations ashore requires the same agility and responsiveness as in OMFTS, with the focus on providing critical intelligence to support timely decisionmaking. However, sustained operations ashore are normally conducted over a greater land area and with a larger force than in OMFTS, creating the requirement for a larger and more widely distributed intelligence support structure. The need for integration with theater, joint, multinational, and other Service intelligence assets is also greater.

Required Intelligence Capabilities

- Field and sustain intelligence structure to support MEF-level operations over extended periods.
- Execute all intelligence functions of a Service component headquarters, including full participation in theater or JTF intelligence activities.
- Ensure sufficient and reliable CIS systems connectivity and interoperability with theater, joint, and other Service intelligence assets participating in the operation.
- Conduct IPB and situation development in support of operational- and tactical-level planning.
- Provide organic imagery, SIGINT, CI, HUMINT, remote sensor, GI&S, and ground and aerial reconnaissance assets that can satisfy MAGTF tactical requirements.
- Provide processing, exploitation, and production capabilities that can supply the extensive products required to support MEF-level planning and execution.
- Provide dissemination systems that link widely dispersed and rapidly maneuvering forces.
- Provide area specialists and linguists with skills that are pertinent to the AO.
- Support force sustainment operations through detailed logistic intelligence.
- Support force protection efforts conducted throughout a large operating area, with emphasis on the security of critical rear area C2 and logistic facilities.

Planning and Direction

Intelligence direction during sustained operations ashore will be centralized during the planning phase and increasingly decentralized during execution. IRs are extensive and cover all aspects of the threat and the battlespace. Comprehensive collection, production, and dissemination efforts will be required to satisfy these requirements. Detailed management is necessary to ensure that these efforts are properly focused and integrated to meet the needs of the entire force. The MAGTF intelligence section will act as the primary intelligence node, developing intelligence to support the MAGTF commander, staff, and subordinate elements. The Marine component headquarters serves as the focal point for connectivity with the theater or JTF intelligence structure. During the planning phase, timeliness of

intelligence production may not be as critical because the planning process for sustained operations ashore normally takes place over an extended period and offers the opportunity to use more time and resources to answer those requirements. (See figure 6-1.)

Intelligence Cycle	Key Considerations
Planning and direction.	MAGTF acting as central mode. Need for broad intelligence structure with extensive liaison requirements.
Collection.	Competition for national, theater, and JTF support. Reliance on organic assets to satisfy many tactical requirements. Support to BDA.
Processing, exploitation, and production	Wide-scope effort that bridges operational and tactical levels. Importance of target and geographic intelligence.
Dissemination.	Extensive CIS infrastructure. Widely dispersed units. Timely support.
Utilization.	Need to integrate operational and tactical levels of intelligence and operations. Support to sustainability functions.

Figure 6-1. Intelligence Considerations During Sustained Operations Ashore.

Once execution begins, the emphasis is on satisfaction of time-sensitive requirements to support operational and tactical decisionmaking. Intelligence nodes will be created at selected times and places to provide tailored intelligence support to units executing specific phases or aspects of the concept of operations. Intelligence direction must balance the support provided among close, deep, and rear operations and the support to current and future operations.

The intelligence structure required to support sustained operations ashore is normally more extensive than that used in other types of MAGTF operations. A detailed planning effort must be undertaken to ensure that the necessary assets are tasked, deployed, and positioned where and when they are required. Sustained operations ashore are frequently based on a theater combatant commander's approved operations plan or other standing contingency plans that include provisions for a baseline intelligence support structure. These plans must be adapted and tailored to the particulars of the current and projected operational situation. Intelligence plans use a building-block approach, phasing in capabilities to keep pace with the buildup of operational forces. Planners must remain aware that intelligence capabilities must be in place to support the earliest steps of the planning phase; therefore, a robust intelligence structure is normally required in the initial stages of the deployment.

Many of the intelligence activities conducted during sustained operations ashore will be joint. Intelligence plans must provide for connectivity with the theater or joint and other component intelligence assets and for participation in theater or JTF intelligence mechanisms. An extensive liaison effort will be required to ensure that MAGTF IRs and operations are fully coordinated with those of joint and other Service intelligence activities. The MARFOR and MAGTF will require significant personnel augmentation to meet the broad scope of intelligence activities in sustained operations ashore and provide liaison teams to the numerous joint and supporting force intelligence agencies. This augmentation can be drawn from residual forces, the supporting establishment or the Reserves.

Collection

Sustained operations ashore will normally be supported by the full range of national- and theater-level collection capabilities and by the organic assets of the participating component forces. Collection priorities for national and theater assets will be determined by the JFC. The bulk of these assets will usually be targeted against overall theater/JTF objectives. Marines must participate in the joint collection management and production processes to ensure that MAGTF PIRs receive

appropriate support from the theater/JTF level. However, even if MAGTF requirements are given priority, the results of national and theater collection operations cannot be relied on to completely satisfy the number of requirements developed during extended sustained operations ashore or to provide the level of detail needed for tactical planning and execution. For this reason, the MAGTF must depend on its organic collection assets to provide the bulk of its tactical intelligence information, particularly during the execution phase. The MAGTF must be prepared to plan and execute imagery, SIGINT, HUMINT, ground reconnaissance, and CI force protection source operations throughout its AO. This includes collection activities in support of deep operations and the planning of future operations. MAGTF collection plans must be coordinated with those of higher, adjacent, and supporting commands to ensure the following:

- All requirements receive adequate coverage.
- Collection assets are employed efficiently with minimal overlaps.
- Collection operations are sufficiently integrated to permit free exchange of collection targeting data and tracking of collection targets as they move through the battlespace.

Processing, Exploitation, and Production

Processing, exploitation, and production efforts in support of sustained operations ashore parallel those for OMFTS. The scope of the initial production is broad, with the focus narrowing as particular COAs are selected and a concept of operations is developed. Geographic intelligence production takes on added importance. Geographic intelligence helps identify opportunities for ground and air maneuver and determine line-of-sight profiles for observation, weapons employment, and the effective use of communications-electronic equipment. Mapping enhancements, lines-of communications studies, and IPB graphics (such as cross-country mobility, weather effects, and combined obstacle overlays) are key intelligence products that support sustained operations ashore.

Threat analysis must be comprehensive and generally deals with large ground and air formations. This analysis covers reserves and committed forces and must consider all factors that affect the enemy's ability to fight at the operational and tactical levels, including leadership, doctrine, training, readiness, and sustainability. An extensive production effort is devoted to supporting CSS operations. The main components of this effort are studies on the local climate, infrastructure, and resources and on the threat to our rear area and lines of communications. Products from national, theater, and JTF intelligence agencies contribute to the production effort, but many of these products will have to be tailored by the AFC and GCE, ACE, and CSSE intelligence sections to satisfy particular MAGTF requirements. During execution, emphasis is placed on rapid processing and production of tactical intelligence to support decisionmaking in the current battle, while at the same time providing detailed intelligence to shape plans for future operations.

Dissemination

The ability to develop and maintain a shared picture of the battlespace among the diverse components of the joint force is essential. MAGTF and Marine component dissemination architectures not only must provide for distributing intelligence within the MAGTF, but also must permit the timely exchange of intelligence with the theater or JTF headquarters, other component commands, and adjacent and supporting units. Marine intelligence architectures must be

fully integrated with the theater or JTF structures. This requires detailed planning and coordination because each theater and JTF has a unique architecture and sometimes separate channels are used for the dissemination of finished intelligence, imagery, SIGINT, HUMINT, and CI information. Dissemination during the early phases is normally simplified by establishing a reliable, redundant communications system between fixed or semi-fixed CPs. However, even a robust communications system will be challenged by the requirement to distribute a large volume of maps, imagery, and other graphic products during the planning stage.

During execution, the dissemination challenges are similar to those of OMFTS; i.e., ensuring the rapid distribution of time sensitive, mission-critical intelligence to widely dispersed units on the move or in contact with the enemy. A number of techniques can be used to prevent the loss of intelligence that is needed for timely decision-making in the stream of intelligence data and information. Some follow:

- Establishing alarm dissemination channels.
- Using broadcast mode for specialized intelligence reporting.
- Employing DSTs or designating a specific element of the intelligence section as a dissemination team.
- Linking dissemination to factors developed in the other phases of intelligence development, such as PIRs, named areas of interest, high-value targets, and high-payoff targets.
- Giving particular attention to the distribution of updated imagery and graphic intelligence products to units that cannot be supported from fixed or semi-fixed intelligence support nodes.

Utilization

The use of intelligence in sustained operations ashore follows the same principles as its use in OMFTS. The difference lies in the scope of the effort required and the need to integrate intelligence and operations simultaneously at multiple levels: theater or JTF, MARFOR, MAGTF, MSC, and tactical units (regiments/groups/battalions/squadrons/detachments).

In sustained operations ashore, intelligence is used to form operational and tactical plans that will accomplish campaign objectives. Broad-based strategic, operational, and tactical intelligence on the enemy and the AO is used by intelligence and operational planners in an interactive process to identify COG and critical vulnerabilities that can be attacked or exploited to achieve campaign objectives. This in turn leads to COA development, selection, and refinement, an effort that must be coordinated and integrated from the theater/JTF down to the tactical level. Intelligence helps determine the main and supporting efforts; designate objectives, times, and locations for these efforts; and identify the support required for each to succeed. During execution, intelligence helps develop the situation, supporting decisions on whether to continue or modify the plan and whether to exploit success or take advantage of new opportunities. At the same time, intelligence facilitates the planning of follow-on operations through support to combat assessment and providing continuing IPB analysis. Intelligence helps plan and conduct critical sustainability functions, contributing key logistic intelligence and force protection recommendations.

CHAPTER 7
MILITARY OPERATIONS OTHER THAN WAR

MOOTW refers to the conduct of Marine and naval expeditionary operations across the range of military operations short of war. MOOTW encompass a wide variety of activities intended to deter war, resolve conflict, promote peace, and support civil authorities. MOOTW encompass a broad range of 16 possible missions and tasks, each of which has its own unique IRs. (See MCDP 1-0.)

Intelligence activities in MOOTW are characterized by the following:

- The initial lack of detailed intelligence databases on the AO.
- An extensive list of nonstandard IRs that must be satisfied to support planning and execution.
- A rapidly changing situation resulting from crisis conditions in the AO.
- A compressed time frame for intelligence development.
- Restrictions on collection operations.

Intelligence shapes operations during MOOTW as it does during other types of expeditionary operations. However, in addition to understanding the physical environment and the threat, the commander must have intelligence on political, economic, and sociological conditions to develop sound military plans that will accomplish the assigned mission.

To support MOOTW, MAGTF intelligence operations and supporting assets must be maintained in a high state of readiness. MAGTF intelligence sections must focus on areas with the greatest potential for executing contingency operations and must be able to respond with minimal warning and preparation. They must also be flexibile to adapt to the wide variety of potential missions, possessing the expertise and specialized capabilities to provide intelligence across the full range of MOOTW.

Required Intelligence Capabilities

- Forward-deployed intelligence sections that are manned, trained, and equipped to respond to a variety of short-notice contingency operations.
- Deployable intelligence assets that can be rapidly "surged" to augment the capabilities of a forward-deployed MAGTF committed to MOOTW.
- Specialized knowledge concerning infrastructure, political, economic, cultural, and sociological conditions in a variety of geographic areas.
- The ability to perform IPB and situation development that focuses on unconventional threat forces, such as security forces, paramilitary groups, insurgents, and terrorists.
- Organic CI and HUMINT capability that is prepared for operation in a variety of MOOTW scenarios.
- SIGINT assets that can collect information from nontraditional targets.
- Dissemination systems that link widely dispersed forces.
- Connectivity to national, theater, joint, and multinational force intelligence assets to provide intelligence support during planning and execution.
- Area specialists and linguists with skills that are pertinent to the AO.
- Expertise in the operations and functioning of non-DOD government agencies, international coalitions, and nongovernmental organizations (NGOs). (An NGO is a transnational organization of private citizens that maintains a consultative status with the United Nations. NGOs may be professional associations, foundations, businesses or groups with a common interest in humanitarian assistance. Examples include the Red Cross and the Cooperative for Assistance and Relief Everywhere.)

Planning and Direction

There are certain unique intelligence considerations during MOOTW. (See figure 7-1.) Direction of the intelligence effort in MOOTW will generally be highly decentralized. During MOOTW, MAGTF elements can be spread across a wide area, each with a different mission and facing a unique situation. While a central node will be needed to direct the efforts of MAGTF intelligence assets and coordinate external support, the bulk of intelligence will be provided by subordinate intelligence sections supporting their individual units. Consideration should be given to directing the intelligence effort on an area-support basis rather than a unit support basis. In an area-support system, intelligence nodes are created to support all units operating in the designated area. IRs will be extensive and diverse. Many will deal with topics and threats that are not normally confronted during conventional operations. Individual intelligence sections and nodes must be provided with expertise or with access to resources that can satisfy these nonstandard requirements.

MOOTW are often generated as a result of fast-moving crisis situations. Intelligence plans must emphasize readiness and flexibility to respond to MOOTW requirements in a timely manner. MAGTF intelligence sections at all levels must maintain an awareness of potential contingency missions and adopt a "lean forward" approach toward anticipating requirements. Forward-deployed MAGTFs must possess all required intelligence capabilities to function in a wide variety of MOOTW missions. The active Marine service components (Marine Forces Atlantic or Pacific) must be prepared to rapidly deploy additional or specialized assets to augment the capabilities of the forward-deployed MAGTF.

In planning the intelligence structure required to support a particular MOOTW, several factors must be considered. The MAGTF intelligence section, whether afloat or ashore, must have connectivity to all supporting external intelligence agencies. It is often necessary to augment subordinate intelligence sections to provide an enhanced capability to support the independent activities of their units. There are normally extensive contacts with organizations outside the US military command structure during MOOTW. Liaison and information exchange with non-DOD agencies and NGOs and multinational and/or host nation military and security forces must be anticipated.

Intelligence Cycle	Key Considerations
Planning and direction.	Decentralized direction. Need for muliple intelligence support nodes with specialized capabilities.
Collection.	Nonstandard requirements. Importance of HUMINT, CI, and nontraditional collection activities.
Processing, exploitation, and production.	Focus on infrastructure, political, economic, and sociological factors. Use of nonstandard production formats.
Dissemination.	Large number of independent units operating throughout the area. Intelligence exchange with joint, multinational, and nonmilitary units.
Utilization.	Need to monitor effectiveness and effect of ongoing operations. Support to force protection, civil affairs, PSYOP, and sustainability.

Figure 7-1. Intelligence Considerations in MOOTW.

Collection

Because MOOTW present nontraditional targets, collection operations must blend the capabilities and limitations of all available assets. Satisfaction of unique MOOTW requirements often requires the use of specialized capabilities or innovative approaches to the employment of standard assets.

During the planning and initial phases of the operation, national and theater assets will be relied on to satisfy basic requirements concerning entry points, infrastructure, and conventional

aspects of the threat. Because supporting intelligence agencies often have limited capabilities in MOOTW situations, organic assets are brought to bear as early as possible, including being employed as part of the advance party or lead element of the force. The nature of the MOOTW environment, threat, and requirements often present a lucrative opportunity for the conduct of HUMINT and CI collections operations. A MAGTF committed to a MOOTW must have a robust CI and HUMINT capability, augmented by appropriate area specialist and linguist support. This capability should be deployed as soon as practical to initiate force protection collection operations and establish necessary liaisons. The MAGTF must also exploit open sources and maintain contact with non-DOD government agencies and NGOs.

Processing, Exploitation, and Production

Intelligence production requirements in MOOTW are normally focused on nontraditional subject areas. For example, detailed knowledge of the host nation's economic, transportation, medical, and public works infrastructure will be required to develop plans for humanitarian assistance operations. Threat studies to support a peacekeeping mission must encompass an extensive treatment of political, cultural, and sociological factors related to various insurgent or paramilitary factions in addition to the threat's military capabilities. Use of area specialists and expertise from external intelligence organizations, non-DOD agencies (State Department, US Agency for International Development, etc.), and NGOs is crucial to satisfying these requirements. Production formats must be adapted to the requirements of a particular situation. Normal IPB analysis must be modified to highlight factors crucial to the specific MOOTW mission. Processing and production in MOOTW must be responsive to the needs of the numerous small elements that may be conducting independent activities throughout the AO. Production in support of these elements must be tailored to specific mission requirements and provide details pertinent to the small-unit level. Intelligence that increases the situational awareness of individual Marines, such as information on local customs, language, and health and sanitation, is an important part of this effort.

Dissemination

Dissemination during MOOTW must provide for the timely distribution of intelligence to a large number of elements that are widely dispersed throughout the AO. Creating intelligence support nodes for a specific area or region will aid the dissemination effort, but only if these nodes are equipped to receive all-source intelligence (in particular imagery and graphic products) from supporting collection and production agencies. Dissemination plans must also include provisions for the exchange of intelligence with other Service and multinational units participating in the operation, non-DOD agencies, and NGOs. Interoperability, sanitation, declassification, and releasability must all be considered and determined before such exchanges can occur.

Utilization

Intelligence shapes the planning and execution of MOOTW just as it does in other types of operations. During planning, intelligence helps determine the nature and scope of the operations and tasks required to accomplish the mission, the size and type of forces required, and the location and duration of the effort required. During execution, intelligence is used to enhance the effectiveness of ongoing operations, assess the results of completed activities, and identify follow-on missions and tasks that will help accomplish the overall objective. Emphasis is also placed on intelligence support of specialized functions that have enhanced importance during MOOTW: logistics, force protection, civil affairs, and PSYOP.

CHAPTER 8
JOINT OPERATIONS AND MULTINATIONAL OPERATIONS

A coordinated intelligence effort makes a critical contribution to the success of joint operations. MAGTFs participate in full partnership with other Services in joint operations. MAGTF intelligence operations are fully integrated with joint intelligence activities to ensure unity of effort, mutual support, and effective employment of limited intelligence resources.

Multinational operations are "military actions conducted by forces of two or more nations, typically organized within the structure of a coalition or alliance." (JP 1-02) MARFORs may participate in a wide variety of multinational operations, ranging from routine bilateral exercises to coalition warfare in major regional contingencies. Instances of unilateral US military operations are becoming less frequent, particularly in MOOTW. Marine units must be prepared to carry out intelligence operations in the context of multinational operations.

Effective intelligence support in joint operations depends on the following:

- Agreement on policies and procedures.
- Mutual intelligence support.
- Shared intelligence capabilities and assets.
- Full interoperability and connectivity among participants.
- Robust liaison.

JFC and Component Commander Responsibilities

JFCs are responsible for all aspects of intelligence support within their commands. They have the responsibility and authority to determine, direct, and coordinate all mission-related collection and analysis activities through centralized or apportioned collection and production management efforts. Component commanders remain responsible for the intelligence function within their commands and use organic intelligence capabilities to support their assigned missions. The JFC makes national, theater, and joint force intelligence assets available to support the efforts of the component commanders. At the same time, component capabilities must be available to assist the joint intelligence effort.

Joint Intelligence Structure

The JFC is assisted in carrying out intelligence responsibilities by the joint force J-2. The J-2 exercises many of the JFC's intelligence functions while acting as the senior intelligence officer in the joint force. Intelligence assets of the joint force headquarters are consolidated in a JISE. The combatant (theater) command is supported by a JIC, which is a standing intelligence element. A JISE is a temporary agency established to provide support to a particular JTF. The JISE provides intelligence support to the JFC and the entire joint force. Marine intelligence specialists will be assigned to the JISE to articulate Marine capabilities and requirements, influence decisions, and optimize intelligence support to the Marine component. Key functions performed by the JISE follow:

- Centralized collection, production, and dissemination management for joint force and supporting intelligence assets.
- All-source intelligence production to satisfy JFC and component requirements.
- Developing and maintaining data bases that support planning, operations, and targeting.

- Producing target studies and materials.
- Providing access to supporting national and theater intelligence assets.

Each theater establishes its own intelligence architecture, providing connectivity between the national- and theater-level intelligence organizations, the JTF, and its component commands. MARFOR and MAGTF intelligence architectures must be able to plug into the architectures of any theater where they might be employed.

Procedures

Joint intelligence activities are governed by joint intelligence doctrine contained in JP 2-0, *Joint Doctrine for Intelligence Support to Operations*, and supporting manuals in the 2-series of JPs. Joint intelligence doctrine is supplemented by combatant commanders' TTP for intelligence developed by each theater command. During joint operations, Marine intelligence activities will adhere to joint doctrine and any published theater TTP pertaining to that operation.

Marine Intelligence Section and Unit Responsibilities

- Operate in accordance with joint intelligence doctrine, theater TTP, and individual JTF procedures.
- Participate in joint intelligence mechanisms to coordinate collection management, intelligence production, HUMINT and SIGINT collection operations, target intelligence support, intelligence architectures, CI activities and collection operations, and other intelligence operations.
- Provide intelligence support to the joint force headquarters or other JTF components as directed.
- Contribute personnel and other assets to augment the J-2 section and JISE if requested.
- Employ joint or other component intelligence assets.
- Enter the JTF intelligence architecture.
- Exchange liaison elements with the J-2, JISE, and/or other JTF components as required.

MARFOR Component Headquarters or MAGTF CE as a JTF Headquarters

A Marine component headquarters or a MAGTF CE may be designated to provide the nucleus of a JTF headquarters.The MARFOR or MAGTF G-2 must be prepared to function as the JTF J-2, with the G-2's intelligence section serving as the base for establishing a JISE. To carry out this function, MARFOR and MEF G-2 sections must prepare plans for operating as a JTF J-2 and conduct the training to be able to execute these plans. Plans should be based on joint doctrine and theater TTP and should include J-2/JISE organization, personnel and equipment requirements (with their augmentation sources), a baseline intelligence architecture, and standing operating procedures. Each MARFOR and MEF G-2 section should establish a standing JTF intelligence planning cell made up of intelligence specialists who are knowledgeable in joint force and other Service intelligence capabilities, limitations, and operating procedures to develop these plans.

Multinational Operations

There is no single intelligence doctrine for multinational operations. Each coalition or alliance must develop its own doctrine. The coalition commander determines standardized procedures for coalition forces. NATO standardization agreements (STANAGs) and quadripartite standing agreements among US, British, Canadian, and Australian forces provide standards and guidance to conduct military operations by forces in these alliances. STANAG 2936, *Intelligence Doctrine*, governs intelligence operations. Joint intelligence doctrine and architectures provide a framework for developing the multinational intelligence support structure. Multinational intelligence operations are based on the following principles:

- Maintain unity of effort. Intelligence operations must be directed at the common threat. A threat to one alliance member should be considered a threat to all.
- Make adjustments. Effective multinational operations require minimizing the differences in national concepts of intelligence support. Commanders and their intelligence officers must be willing to make adjustments to national procedures to share intelligence and integrate intelligence operations. Special arrangements should be considered for developing, communicating, and using intelligence where there are differences in nations' language, culture, doctrine, terminology, organization, and equipment.
- Plan early and concurrently. Multinational forces' IRs and procedures should be identified, planned, coordinated, and exercised before execution.
- Share all necessary intelligence. Each coalition member should share intelligence that supports planning and execution. However, information about intelligence sources and methods should not be shared unless absolutely necessary. The methodology for exchanging intelligence should be developed and exercised before operations begin. Authorization for foreign disclosure should be obtained and procedures for sanitation and declassification should be developed as part of this planning process. During execution, the exchange must be monitored and adapted to ensure that it is meeting the needs of all coalition partners.
- Conduct complementary intelligence operations. Each nation's intelligence assets capitalize on their strengths and offset the weaknesses of other members' assets, providing the coalition with the most effective blend of capabilities.

Many potential allies may not possess the range of US intelligence capabilities; therefore, US intelligence sections must expect to take the lead in developing intelligence during multinational operations. Particular attention must be given to provisions for sanitation, declassification, and releasability of intelligence developed by US forces and agencies to coalition partners. Personnel who are knowledgeable in these techniques and procedures must be included in the MAGTF or Marine component intelligence section. Intelligence plans must provide for connectivity with multinational forces and liaison elements with appropriate linguistic and area specialist skills.

APPENDIX A
GLOSSARY

Section I. Acronyms

ACE . . . . . aviation combat element
AC/S . . . . . .assistant chief of staff
AFC. . . . . all-source fusion center
AFP . . . . . all-source fusion platoon
AIntP. . . . . Allied Intelligence Publication
AO. . . . . .area of operations
ATARS . . . . . advanced tactical airborne reconnaissance system
ATFIC. . . . . amphibious task force intelligence center

BDA . . . . . battle damage assessment

C2 . . . . . .command and control
C2W . . . . . command and control warfare
CCIR. . . . . commander's critical information requirements
CE . . . . . command element
CGS. . . . . common ground station
CHATS . . . . . CI/HUMINT automated tool set
CI . . . . . .counterintelligence
CIA . . . . . Central Intelligence Agency
CIC . . . . . combat intelligence center
CIS . . . . . communications and information systems
CMDO . . . . . collection management/ dissemination officer
Co . . . . . .company
COA . . . . . course of action
COG . . . . . .center of gravity
COP. . . . . common operational picture
CP . . . . . command post
CSS . . . . . combat service support
CSSE. . . . . .combat service support element
CTP. . . . . .common tactical picture
CV. . . . . .critical vulnerability

DIA . . . . . .Defense Intelligence Agency
DMS . . . . . .Defense Message System
DOD . . . . . Department of Defense
DST. . . . . .direct support team

EW . . . . . .electronic warfare
FBI . . . . . .Federal Bureau of Investigation
FRAGO. . . . . .fragmentary order
FSCC. . . . . .fire support coordination center
FSSG. . . . . force service support group

GCE . . . . . ground combat element
GI&S. . . . . .geospatial information and services
GSP. . . . . ground sensor platoon

HET. . . . . .HUMINT exploitation team
HLZ. . . . . helicopter landing zone
HUMINT . . . . . .human intelligence

I&W . . . . . .indications and warning
IAS . . . . . .intelligence analysis system
ICR . . . . . intelligence collection requirement
IDR . . . . . intelligence dissemination requirement
IIP . . . . . imagery intelligence platoon
IMA. . . . . individual mobilization augmentee
IMINT. . . . . .imagery intelligence
intel bn . . . . . intelligence battalion
IO . . . . . .information operations
IOC . . . . . .intelligence operations center
IOS . . . . . .intelligence operations server
IOW . . . . . .intelligence operations workstation
IPB . . . . . .intelligence preparation of the battlespace
IPR . . . . . intelligence production requirement
IR . . . . . .intelligence requirement
ISC . . . . . intelligence support coordinator

JIC. . . . . joint intelligence center
JISE. . . . . joint intelligence support element
JSTARS . . . . . .Joint Surveillance Target Attack Radar System
JTF . . . . . .joint task force
JWICS. . . . . .Joint Worldwide Intelligence Communication System

MAGTF . . . . . Marine air-ground task force

MARFOR . . . . . .Marine Corps forces
MARFORRES . . . . . Marine Forces Reserve
MASINT . . . . . measurement and signature intelligence
MAW . . . . . Marine aircraft wing
MCDP . . . . . Marine Corps doctrinal publication
MCIA . . . . . Marine Corps Intelligence Activity
MCWP . . . . . Marine Corps warfighting publication
MEB . . . . . .Marine Expeditionary Brigade
MEF . . . . . Marine Expeditionary Force
MEU . . . . . Marine Expeditionary Unit
MEU(SOC) . . . . . Marine Expeditionary Unit (Special Operations Capable)
MIDB . . . . . .modernized integrated database
MOOTW . . . . .military operations other than war
MSC . . . . . major subordinate command

NGO . . . . . .nongovernmental organization
NIMA . . National Imagery and Mapping Agency
NMITC . . . . . Navy-Marine Corps Intelligence Training Center
NIPRNET . . . . . Nonsecure Internet Protocol Router Network
NIST . . . . . National Intelligence Support Team
NSA . . . . . National Security Agency

OCAC . . . .operations control and analysis center
OIC . . . . . .officer in charge
OMFTS . . . . . operational maneuver from the sea
OODA . . . . . observe, orient, decide, and act
OP . . . . . .observation post
OPCON . . . . . .operational control
OPLAN . . . . . .operation plan
OPORD . . . . . operational order
OPSEC . . . . . .operations security
OSINT . . . . . open-source intelligence

P&A . . . . . production and analysis
PDE&A . . . . . planning, decision, execution, and assessment
PIR . . . . . priority intelligence requirements
PSYOP . . . . . psychological operations

R&S . . . . . reconaissance and surveillance
recon . . . . . reconaissance
rep . . . . . .representative
RRS . . . . . .remote receiver station

SARC . . . . . surveillance and reconnaissance cell
SIDS . . secondary imagery dissemination system
SIGINT . . . . . .signals intelligence
SIPRNET . . . . . Secret Internet Protocol Router Network
SSU . . . . . SIGINT support unit
STANAG . . . . . standardization agreement

TCAC . . . Technical Control and Analysis Center
TDN . . . . . tactical data network
TEG. . . . . Technical Exploitation Group
TERPES . . . . . tactical electronic reconnaissance processing and evaluation system
TGTINTEL . . . . . .target intelligence
TRAP . . . . . .tactical recovery of aircraft and personnel
TPC . . . . . topographic production capability
TRSS . . . . . .tactical remote sensor system
TTP . . . . . tactics, techniques, and procedures

UAV . . . . . .unmanned aerial vehicle
VMU . . . . . .Marine unmanned aerial vehicle squadron

Section II. Definitions

all-source intelligence—Intelligence products and/or organizations and activities that incorporate all sources of information, including, most frequently, human resources intelligence, imagery intelligence, measurement and signature intelligence, signals intelligence, and open source data, in the production of finished intelligence. (JP 1-02)

battle damage assessment—1. The timely and accurate estimate of damage resulting from the application of military force, either lethal or nonlethal, against a predetermined objective. Battle damage assessment can be applied to the employment of all types of weapon systems (air, ground, naval, and special forces weapon systems) throughout the range of military operations. Battle damage

assessment is primarily an intelligence responsibility with required inputs and coordination from the operators. Battle damage assessment is composed of physical damage assessment, functional damage assessment, and target system assessment. Also called BDA. (JP 1-02) **2.** The timely and accurate estimate of the damage resulting from the application of military force. BDA estimates physical damage to a particular target, functional damage to that target, and the capability of the entire target system to continue its operations. (MCWP 2-1)

centers of gravity—1. Those characteristics, capabilities, or localities from which a military force derives its freedom of action, physical strength, or will to fight. Also called COG. (JP 1-02) **2.** A key source of strength without which an enemy cannot function. (MCDP 1-2)

collection—The gathering of intelligence data and information to satisfy the identified requirements. (MCWP 2-1)

collection management—1. The process of converting intelligence requirements into collection requirements, establishing priorities, and tasking or coordinating with appropriate collection sources or agencies, monitoring results and retasking, as required. (JP 1-02) **2.** Its purpose is to conduct an effective effort to collect all necessary data while ensuring the efficient use of limited and valuable collection assets. (MCWP 2-1)

combat data—Data derived from reporting by operational units. (MCWP 2-1)

command and control—1. The exercise of authority and direction by a properly designated commander over assigned and attached forces in the accomplishment of the mission. Command and control functions are performed through an arrangement of personnel, equipment, communications, facilities, and procedures employed by a commander in planning, directing, coordinating, and controlling forces and operations in the accomplishment of the mission. Also called C2. (JP 1-02) **2.** The means by which a commander recognizes what needs to be done and sees to it that appropriate actions are taken. (MCDP 6) commander's critical information requirements—Information regarding the enemy and friendly activities and the environment identified by the commander as critical to maintaining situational awareness, planning future activities, and facilitating timely decisionmaking. Also called CCIR. (MCRP 5-12C)

commander's intent—A commander's clear, concise personal articulation of the reason(s) behind one or more tasks assigned to a subordinate. It is one of two components of every mission statement which supports the higher and/or supported commander's intent and guides the exercise of initiative in the absence of instructions. (MCRP 5-12C)

counterintelligence—Within the Marine Corps, CI constitutes active and passive measures intended to deny a threat force valuable information about the friendly situation, to detect and neutralize hostile intelligence collection, and to deceive the enemy as to friendly capabilities and intentions. Also called CI. (MCWP 2-1)

critical vulnerability—An aspect of a center of gravity that if exploited will do the most significant damage to an adversary's ability to resist. Also called CV. (MCRP 5-12C)

descriptive intelligence—Class of intelligence which describes existing and previously existing conditions intended to promote situational awareness. Descriptive intelligence has two components: basic intelligence, which is general background knowledge about established and relatively constant conditions; and current intelligence, which is concerned with describing the existing situation. (MCRP 5-12C)

dissemination—Conveyance of intelligence to users in a suitable form. (JP 1-02)

dissemination management—Involves establishing dissemination priorities, selecting dissemination means, and monitoring the flow of intelligence throughout the command. The objective of dissemination management is to deliver the required intelligence to the appropriate user in proper form at the right time while ensuring that individual consumers and the dissemination system are not overloaded by attempting to move unneeded or irrelevant information. Dissemination management also provides for use of security controls that do not impede the timely delivery or subsequent use of intelligence while protecting intelligence sources and methods. (MCWP 2-1)

estimative intelligence—Class of intelligence which attempts to anticipate future possibilities and probabilities based upon descriptive intelligence in the context of planned enemy and friendly operations. (MCRP 5-12C)

human intelligence—1. A category of intelligence derived from information collected and provided by human sources. (JP 1-02) **2.** HUMINT operations cover a wide range of activities encompassing reconnaissance patrols, aircrew reports and debriefs, debriefing of refugees, interrogations of prisoners of war, and the conduct of CI force protection source operations. Also called HUMINT. (MCWP 2-1)

imagery intelligence—Intelligence derived from the exploitation of collection by visual photography, infrared sensors, lasers, electro-optics, and radar sensors such as synthetic aperture radar wherein images of objects are reproduced optically or electronically on film, electronic display devices, or other media. Also called IMINT. (JP 1-02)

indications and warning—Those intelligence activities intended to detect and report time-sensitive intelligence information on foreign developments that could involve a threat to the United States or allied military, political, or economic interests or to US citizens abroad. It includes forewarning of enemy actions or intentions; the imminence of hostilities; insurgency; nuclear/non-nuclear attack on the United States, its overseas forces, or allied nations; hostile reactions to United States reconnaissance activities; terrorists' attacks; and other similar events. Also called I&W. (JP 1-02)

intelligence—1. The product resulting from the collection, processing, integration, analysis, evaluation, and interpretation of available information concerning foreign countries or areas. **2.** Information and knowledge about an adversary obtained through observation, investigation, analysis, or understanding. (JP 1-02) **3.** Knowledge of the enemy and the surrounding environment that is needed to support decisionmaking. (MCDP 2)

intelligence cycle—The steps by which information is converted into intelligence and made available to users. (JP 1-02)

intelligence data—Data derived from assets primarily dedicated to intelligence collection: imagery systems, electronic intercept equipment, human intelligence sources, and so on. (MCWP 2-1)

intelligence discipline—A well-defined area of intelligence collection, processing, exploitation, and reporting using a specific category of technical or human resources. There are five major disciplines: human intelligence, imagery intelligence, measurement and signature intelligence, signals intelligence (communications intelligence, electronic intelligence, and foreign instrumentation signals intelligence), and open-source intelligence. (JP 1-02)

intelligence operations—The variety of intelligence tasks that are carried out by various intelligence organizations and activities. (JP 1-02)

intelligence preparation of the battlespace—**1.** An analytical methodology employed to reduce uncertainties concerning the enemy, environment, and terrain for all types of operations. Intelligence preparation of the battlespace builds an extensive data base for each potential area in which a unit may be required to operate. The data base is then analyzed in detail to determine the impact of the enemy, environment, and terrain on operations and presents it in graphic form. Intelligence preparation of the battlespace is a continuing process. Also called IPB. (JP 1-02) **2.** A systematic, continuous process of analyzing the threat and environment in a specific geographic area. (MCWP 2-1)

intelligence requirement—**1.** Any subject, general or specific, upon which there is a need for the collection of information, or the production of intelligence. Also called IR. (JP 1-02) **2.** Questions about the enemy and the environment, the answers to which a commander requires to make sound decisions. (MCDP 2)

joint force—A general term applied to a force composed of significant elements, assigned or attached, of two or more Military Departments, operating under a single joint force commander. (JP 1-02)

joint intelligence center—The intelligence center of the joint force headquarters. The joint intelligence center is responsible for providing and producing the intelligence required to support the joint force commander and staff, components, task forces and elements, and the national intelligence community. Also called JIC. (JP 1-02)

joint operations—A general term to describe military actions conducted by joint forces, or by Service forces in relationships (e.g., support, coordinating authority), which, of themselves, do not create joint forces. (JP 1-02)

main effort—The designated subordinate unit whose mission at a given point in time is most critical to the overall mission success. (MCRP 5-12C)

maneuver warfare—A warfighting philosophy that seeks to shatter the enemy's cohesion through a variety of rapid, focused, and unexpected actions which create a turbulent and rapidly deteriorating situation with which the enemy cannot cope. (MCDP 1)

measurement and signature intelligence—**1.** Scientific and technical intelligence obtained by quantitative and qualitative analysis of data (metric, angle, spatial, wavelength, time dependence, modulation, plasma, and hydromagnetic) derived from specific technical sensors for the purpose of identifying any distinctive features associated with the target. The detected feature may be either reflected or emitted. Also called MASINT. (JP 1-02) **2.** Intelligence information gathered by technical instruments such as radars, passive electrooptical sensors, radiation detectors, and remote ground sensors. (MCWP 2-1)

open-source intelligence—**1.** Information of potential intelligence value that is available to the general public. Also called OSINT. (JP 1-02) **2.** OSINT sources include books, magazines, newspapers, maps, commercial electronic networks and databases, and radio and television broadcasts. OSINT involves no information that is classified at its origin or acquired through controlled collection. (MCWP 2-1)

priority intelligence requirements—**1.** Those intelligence requirements for which a commander has an anticipated and stated priority in his task of planning and decisionmaking. Also called PIR. (JP 1-02) **2.** An intelligence requirement MCWP 2-1 Intelligence Operations A-5 associated with a

decision that will critically affect the overall success of the command's mission. (MCDP 2)

production management—Encompasses determining the scope, content, and format of each product; developing a plan and schedule for the development of each product; assigning priorities among the various IPRs; allocating processing, exploitation, and production resources; and integrating production efforts with collection and dissemination. (MCWP 2-1)

sensor data—Data derived from sensors whose primary mission is surveillance or target acquisition: air surveillance radars, counterbattery radars, and remote ground sensors. (MCWP 2-1)

signals intelligence—1. A category of intelligence comprising either individually or in combination all communications intelligence, electronics intelligence, and foreign instrumentation signals intelligence, however transmitted. **2.** Intelligence derived from communications, electronics, and foreign instrumentation signals. Also called SIGINT (JP 1-02)

situational awareness—Knowledge and understanding of the current situation which provides timely, relevant and accurate assessment of friendly, enemy and other operations within the battlespace. Also called SA. (MCRP 5-12C)

tactical intelligence—1. Intelligence that is required for planning and conducting tactical operations. (JP 1-02) **2.** Tactical intelligence concerns itself primarily with the location, capabilities, and possible intentions of enemy units on the battlefield and with the tactical aspects of terrain and weather. (MCDP 2)

warfighting functions—The six mutually supporting military activities integrated in the conduct of all military operations: command and control, intelligence, maneuver, fires, logistics, and force protection. (MCRP 5-12C)

INDEX Index-1

Preface

This manual provides doctrinal guidance, techniques, and procedures governing the employment of human intelligence (HUMINT) collection and analytical assets in support of the commander's intelligence needs. It outlines—

- HUMINT operations.
- The HUMINT collector's role within the intelligence operating system.
- The roles and responsibilities of the HUMINT collectors and the roles of those providing the command, control, and technical support of HUMINT collection operations.

This manual expands upon the information contained in FM 2-0. It supersedes FM 34-52 and rescinds ST 2-22.7. It is consistent with doctrine in FM 3-0, FM 5-0, FM 6-0, and JP 2-0. In accordance with the Detainee Treatment Act of 2005, the only interrogation approaches and techniques that are authorized for use against any detainee, regardless of status or characterization, are those authorized and listed in this Field Manual. Some of the approaches and techniques authorized and listed in this Field Manual also require additional specified approval before implementation.

This manual will be reviewed annually and may be amended or updated from time to time to account for changes in doctrine, policy, or law, and to address lessons learned.

This manual provides the doctrinal guidance for HUMINT collectors and commanders and staffs of the MI organizations responsible for planning and executing HUMINT operations. This manual also serves as a reference for personnel developing doctrine, tactics, techniques, and procedures (TTP); materiel and force structure; institutional and unit training; and standing operating procedures (SOPs), for HUMINT operations at all army echelons. In accordance with TRADOC Regulation 25-36, the doctrine in this field manual is not policy (in and of itself), but is "…a body of thought on how Army forces operate….[It] provides an authoritative guide for leaders and soldiers, while allowing freedom to adapt to circumstances."

This manual applies to the Active Army, the Army National Guard/Army National Guard of the United States, and the United States Army Reserve unless otherwise stated. This manual also applies to DOD civilian employees and contractors with responsibility to engage in HUMINT collection activities. It is also intended for commanders and staffs of joint and combined commands, and Service Component Commands (SCC). Although this is Army doctrine, adaptations will have to be made by other Military Departments, based on each of their organizations and specific doctrine.

Material in this manual applies to the full range of military operations. Principles outlined also are valid under conditions involving use of electronic warfare (EW) or nuclear, biological, or chemical (NBC) weapons.

This manual is intended for use by military, civilian, and civilian contractor HUMINT collectors, as well as commanders, staff officers, and military intelligence (MI) personnel charged with the responsibility of the HUMINT collection effort.

HUMINT operations vary depending on the source of the information. It is essential that all HUMINT collectors understand that, whereas operations and sources may

differ, the handling and treatment of sources must be accomplished in accordance with applicable law and policy. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including fragmentary orders (FRAGOs).

Interrogation, the HUMINT subdiscipline responsible for MI exploitation of enemy personnel and their documents to answer the supported specific information requirements (SIRs), requires the HUMINT collector to be fully familiar with both the classification of the source and applicable law. The principles and techniques of HUMINT collection are to be used within the constraints established by US law including the following:

- The Uniform Code of Military Justice (UCMJ).
- Geneva Convention for the Amelioration of the Condition of the Wounded and Sick in Armed Forces in the Field (including Common Article III), August 12, 1949; hereinafter referred to as GWS.
- Geneva Convention Relative to the Treatment of Prisoners of War (including Common Article III), August 12, 1949; hereinafter referred to as GPW.
- Geneva Convention Relative to the Protection of Civilian Persons in Time of War (including Common Article III), August 12, 1949; hereinafter referred to as GC.
- Detainee Treatment Act of 2005, Public Law No. 109-163, Title XIV.

HUMINT collectors must understand specific terms used to identify categories of personnel when referring to the principles and techniques of interrogation. Determination of a detainee's status may take a significant time and may not be completed until well after the time of capture. Therefore, there will be no difference in the treatment of a detainee of any status from the moment of capture until such a determination is made. The following terms are presented here and in the glossary.

- Civilian Internee: A person detained or interned in the United States or in occupied territory for security reasons, or for protection, or because he or she has committed an offense against the detaining power, and who is entitled to "protected person" status under the GC.
- Enemy Prisoner of War (EPW): A detained person, as defined in Articles 4 and 5 of the GPW. In particular, one who, while engaged in combat under orders of his or her government, is captured by the armed forces of the enemy. As such, he or she is entitled to the combatant's privilege of immunity from the municipal law of the capturing state for warlike acts that do not amount to breaches of the law of armed conflict. For example, an EPW may be, but is not limited to, any person belonging to one of the following categories of personnel who have fallen into the power of the enemy; a member of the armed forces, organized militia or volunteer corps; a person who accompanies the armed forces, without actually being a member thereof; a member of a merchant marine or civilian aircraft crew not qualifying for more favorable treatment; or individuals who, on the approach of the enemy, spontaneously take up arms to resist invading forces.
- Other Detainees: Persons in the custody of the US Armed Forces who have not been classified as an EPW (Article 4, GPW), retained personnel (Article 33, GPW), and Civilian Internee (Articles 27, 41, 48, and 78, GC) shall be treated as EPWs until a legal status is ascertained by competent authority; for example, by Article 5 Tribunal.
- Retained Personnel: (See Articles 24 and 26, GWS.)

  - Official medical personnel of the armed forces exclusively engaged in the search for, or the collection, transport or treatment of wounded or sick, or in the prevention of disease, and staff exclusively engaged in the administration of medical units and facilities.
  - Chaplains attached to the armed forces.
  - Staff of National Red Cross Societies and that of other Volunteer Aid Societies, duly recognized and authorized by their governments to assist Medical Service personnel of their own armed forces, provided they are exclusively engaged in the search for, or the collection, transport or treatment of wounded or sick, or in the prevention of disease, and provided that the staff of such societies are subject to military laws and regulations.

- Protected Persons: Include civilians entitled to protection under the GC, including those we retain in the course of a conflict, no matter what the reason.
- Enemy Combatant: In general, a person engaged in hostilities against the United States or its coalition partners during an armed conflict. The term "enemy combatant" includes both "lawful enemy combatants" and "unlawful enemy combatants." All captured or detained personnel, regardless of status, shall be treated humanely, and in accordance with the Detainee Treatment Act of 2005 and DOD Directive 2310.1E, "Department of Defense Detainee Program", and no person in the custody or under the control of DOD, regardless of nationality or physical location, shall be subject to torture or cruel, inhuman, or degrading treatment or punishment, in accordance with and as defined in US law.
  - **Lawful Enemy Combatant:** Lawful enemy combatants, who are entitled to protections under the Geneva Conventions, include members of the regular armed forces of a State Party to the conflict; militia, volunteer corps, and organized resistance movements belonging to a State Party to the conflict, which are under responsible command, wear a fixed distinctive sign recognizable at a distance, carry their arms openly, and abide by the laws of war; and members of regular armed forces who profess allegiance to a government or an authority not recognized by the detaining power.
  - **Unlawful Enemy Combatant:** Unlawful enemy combatants are persons not entitled to combatant immunity, who engage in acts against the United States or its coalition partners in violation of the laws and customs of war during an armed conflict. For the purposes of the war on terrorism, the term "unlawful enemy combatant" is defined to include, but is not limited to, an individual who is or was part of or supporting Taliban or al Qaeda forces, or associated forces that are engaged in hostilities against the United States or its coalition partners.

Headquarters, U.S. Army Training and Doctrine Command (TRADOC) is the proponent for this publication. The preparing agency is the US Army Intelligence Center and Fort Huachuca, Fort Huachuca, AZ. Send written comments and recommendations on DA Form 2028 (Recommended Changes to Publications and Blank Forms) directly to Commander, ATZS-CDI-D (FM 2-22.3), U.S. Army Intelligence Center and Fort Huachuca, 550 Cibeque Street, Fort Huachuca, AZ 85613-7017. Send comments and recommendations by e-mail to ATZS-FDT-D@hua.army.mil. Follow the DA Form 2028 format or submit an electronic DA Form 2028.

Unless otherwise stated, masculine nouns and pronouns do not refer exclusively to men. Use of the terms "he" and "him" in this manual should be read as referring to both males and females unless otherwise expressly noted.

PART ONE

HUMINT Support, Planning, and Management

HUMINT collection activities include three general categories: screening, interrogation, and debriefing. In some cases these may be distinguished by legal distinctions between source categories such as between interrogation and debriefing. In others, the distinction is in the purpose of the questioning. Regardless of the type of activity, or goal of the collection effort, HUMINT collection operations must be characterized by effective support, planning, and management.

Chapter 1

Introduction

INTELLIGENCE BATTLEFIELD OPERATING SYSTEM

1-1. The Intelligence battlefield operating system (BOS) is one of seven operating systems—Intelligence, maneuver, fire support, air defense, mobility/countermobility/survivability, combat service support (CSS), and command and control—that enable commanders to build, employ, direct, and sustain combat power. The Intelligence BOS is a flexible force of Intelligence personnel, organizations, and equipment. Individually and collectively, these assets generate knowledge of and products portraying the enemy and the environmental features required by a command planning, preparing, executing, and assessing operations. Inherent within the Intelligence BOS is the capability to plan, direct, and synchronize intelligence, surveillance, and reconnaissance (ISR) operations; collect and process information; produce relevant intelligence; and disseminate intelligence and critical information in an understandable and presentable form to those who need it, when they need it. As one of the seven disciplines of the Intelligence BOS, HUMINT provides a capability to the supported commander in achieving information superiority on the battlefield.

INTELLIGENCE PROCESS

1-2. Intelligence operations consist of the functions that constitute the intelligence process: **plan, prepare, collect, process, produce**, and the common tasks of **analyze, disseminate,** and **assess** that occur throughout the intelligence process. Just as the activities of the operations process overlap and recur as circumstances demand, so do the functions of the intelligence process. Additionally, the analyze, disseminate, and assess tasks

of the intelligence process occur continuously throughout the intelligence process. (See Figure 1-1.)

- **Plan**. This step of the intelligence process consists of activities that include assessing the situation, envisioning a desired outcome (also known as setting the vision), identifying pertinent information and intelligence requirements, developing a strategy for ISR operations to satisfy those requirements, directing intelligence operations, and synchronizing the ISR effort. The commander's intent, planning guidance, and commander's critical information requirements (CCIRs) (priority information requirements [PIRs] and friendly force information requirements [FFIRs]) drive the planning of intelligence operations. Commanders must involve their supporting staff judge advocate (SJA) when planning intelligence operations (especially HUMINT operations). Planning, managing, and coordinating these operations are continuous activities necessary to obtain information and produce intelligence essential to decisionmaking.
- **Prepare**. This step includes those staff and leader activities that take place upon receiving the operations plan (OPLAN), operations order (OPORD), warning order (WARNO), or commander's intent to improve the unit's ability to execute tasks or missions and survive on the battlefield.
- **Collect.** Recent ISR doctrine necessitates that the entire staff, especially the G3/S3 and G2/S2, must change their reconnaissance and surveillance (R&S) mindset to conducting ISR. The staff must carefully focus ISR on the CCIR but also enable the quick re-tasking of units and assets as the situation changes. This doctrinal requirement ensures that the enemy situation, not just our OPLAN, "drives" ISR operations. Well-developed procedures and carefully planned flexibility to support emerging targets, changing requirements, and the need to support combat assessment are critical. The G3/S3 and G2/S2 play a critical role in this challenging task that is sometimes referred to as "fighting ISR" because it is so staff intensive during planning and execution (it is an operation within the operation). Elements of all units on the battlefield obtain information and data about enemy forces, activities, facilities, and resources as well as information concerning the environmental and geographical characteristics of a particular area.
- **Process.** This step converts relevant information into a form suitable for analysis, production, or immediate use by the commander. Processing also includes sorting through large amounts of collected information and intelligence (multidiscipline reports from the unit's ISR assets, lateral and higher echelon units and organizations, and non-MI elements in the battlespace). Processing identifies and exploits that information which is pertinent to the commander's intelligence requirements and facilitates situational understanding. Examples of processing include developing film, enhancing imagery, translating a document from a foreign language, converting electronic data into a standardized report that can be analyzed by a system operator, and

correlating dissimilar or jumbled information by assembling like elements before the information is forwarded for analysis.

- **Produce.** In this step, the G2/S2 integrates evaluated, analyzed, and interpreted information from single or multiple sources and disciplines into finished intelligence products. Like collection operations, the G2/S2 must ensure the unit's information processing and intelligence production are prioritized and synchronized to support answering the collection requirements.

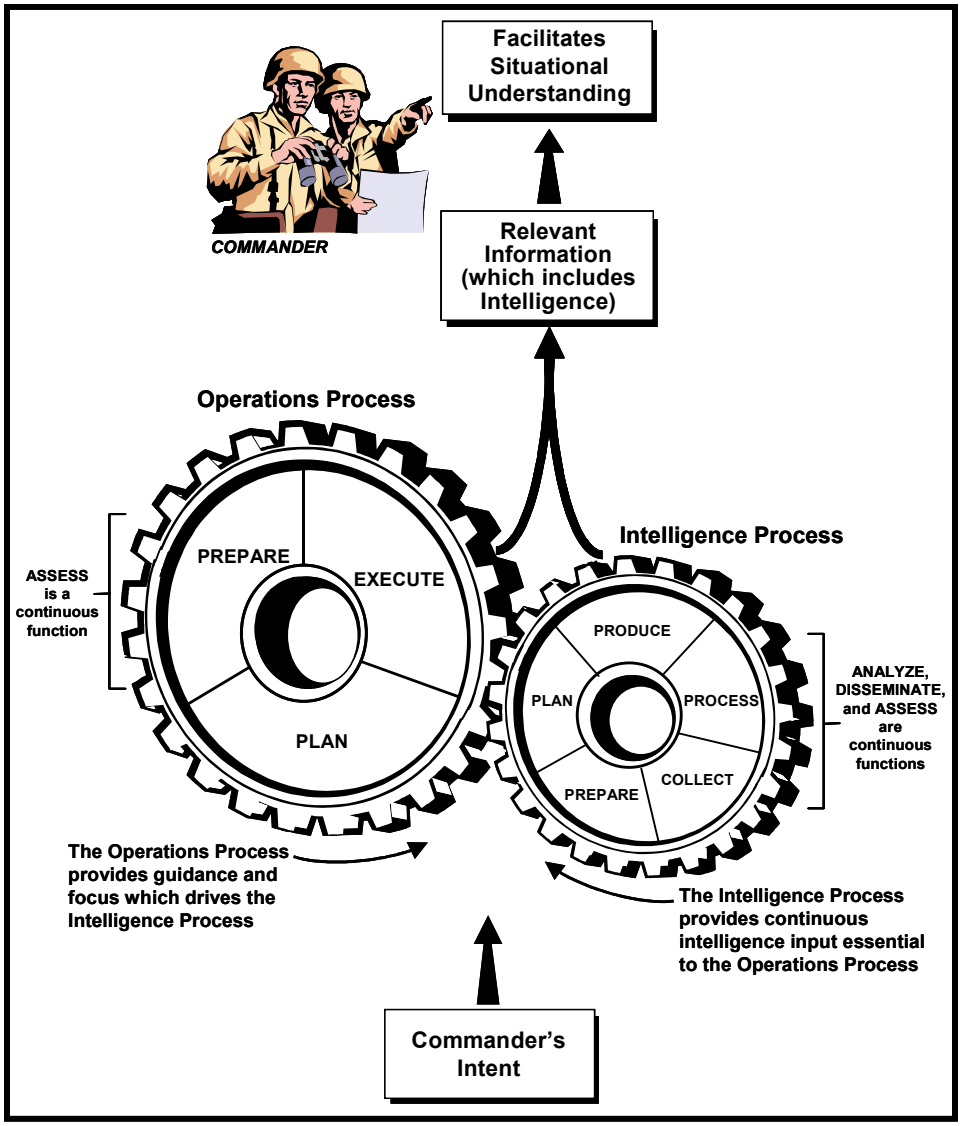

Figure 1-1. Intelligence Process.

1-3. For more information on the Intelligence process, see FM 2-0.

HUMAN INTELLIGENCE

1-4. HUMINT is the collection of information by a trained HUMINT collector (military occupational specialties [MOSs] 97E, 351Y [formerly 351C], 351M [formerly 351E], 35E, and 35F), from people and their associated documents and media sources to identify elements, intentions, composition, strength, dispositions, tactics, equipment, personnel, and capabilities. It uses human sources as a tool and a variety of collection methods, both passively and actively, to gather information to satisfy the commander's intelligence requirements and cross-cue other intelligence disciplines.

1-5. HUMINT tasks include but are not limited to—

- Conducting source operations.
- Liaising with host nation (HN) officials and allied counterparts.
- Eliciting information from select sources.
- Debriefing US and allied forces and civilian personnel including refugees, displaced persons (DPs), third-country nationals, and local inhabitants.
- Interrogating EPWs and other detainees.
- Initially exploiting documents, media, and materiel.

Note. In accordance with Army regulatory and policy guidance, a select set of intelligence personnel may be trained and certified to conduct certain HUMINT tasks outside of those which are standard for their primary MOS. Such selection and training will qualify these personnel to conduct only those specific additional tasks, and will not constitute qualifications as a HUMINT collector.

HUMINT SOURCE

1-6. A HUMINT source is a person from whom information can be obtained. The source may either possess first- or second-hand knowledge normally obtained through sight or hearing. Potential HUMINT sources include threat, neutral, and friendly military and civilian personnel. Categories of HUMINT sources include but are not limited to detainees, refugees, DPs, local inhabitants, friendly forces, and members of foreign governmental and non-governmental organizations (NGOs).

HUMINT COLLECTOR

1-7. For the purpose of this manual, a HUMINT collector is a person who is specifically trained and certified for, tasked with, and engages in the collection of information from individuals (HUMINT sources) for the purpose of answering intelligence information requirements. HUMINT collectors specifically include enlisted personnel in MOS 97E, Warrant Officers (WOs) in MOS 351M (351E) and MOS 351Y (351C), commissioned officers in MOS 35E and MOS 35F, select other specially trained MOSs, and their Federal civilian employee and civilian contractor counterparts. These specially trained and certified individuals are the **only** personnel authorized to conduct HUMINT collection operations, although CI agents also use HUMINT collection techniques in the conduct of CI operations. HUMINT

collection operations must be conducted in accordance with applicable law and policy. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs. Additional policies and regulations apply to management of contractors engaged in HUMINT collection. (See Bibliography for additional references on contractor management.) HUMINT collectors are not to be confused with CI agents, MOS 97B and WO MOS 351L (351B). CI agents are trained and certified for, tasked with, and carry out the mission of denying the enemy the ability to collect information on the activities and intentions of friendly forces. Although personnel in 97E and 97B MOSs may use similar methods to carry out their missions, commanders should not use them interchangeably. See Figure 1-2 for HUMINT and CI functions.

PHASES OF HUMINT COLLECTION

1-8. Every HUMINT questioning session, regardless of the methodology used or the type of operation, consists of five phases. The five phases of HUMINT collection are planning and preparation, approach, questioning, termination, and reporting. They are generally sequential; however, reporting may occur at any point within the process when critical information is obtained and the approach techniques used will be reinforced as required through the questioning and termination phases.

Planning and Preparation

1-9. During this phase, the HUMINT collector conducts the necessary research and operational planning in preparation for a specific collection effort with a specific source. Chapter 7 discusses this phase in detail.

Approach

1-10. During the approach phase, the HUMINT collector establishes the conditions of control and rapport to gain the cooperation of the source and to facilitate information collection. Chapter 8 discusses approach and termination strategies in detail.

Questioning

1-11. During the questioning phase, the HUMINT collector uses an interrogation, debriefing, or elicitation methodology to ask a source questions systematically on relevant topics, collect information in response to the intelligence tasking, and ascertain source veracity. Chapter 9 discusses questioning techniques in detail. (See Appendix B for a source and reliability matrix.)

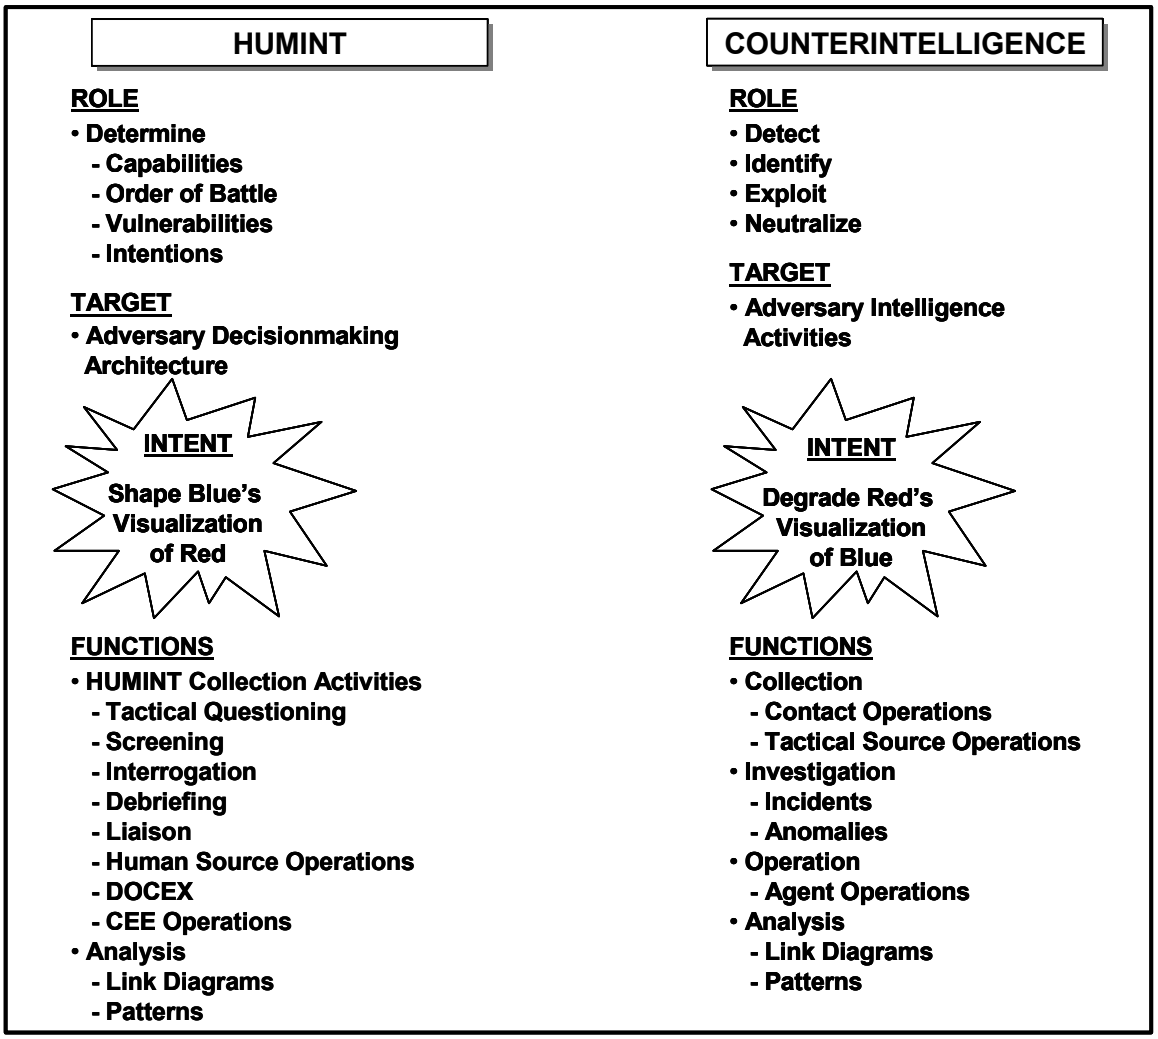

Figure 1-2. HUMINT and CI Functions.

Termination

1-12. During the termination phase, the HUMINT collector completes a questioning session and establishes the necessary conditions for future collection from the same source by himself or another HUMINT collector. (See Chapter 8.)

Reporting

1-13. During the reporting phase, the HUMINT collector writes, edits, and submits written, and possibly oral, reports on information collected in the course of a HUMINT collection effort. These reports will be reviewed, edited, and analyzed as they are forwarded through the appropriate channels. Chapter 10 discusses reporting in detail.

HUMINT COLLECTION AND RELATED ACTIVITIES

1-14. HUMINT collection activities include these categories: tactical questioning, screening, interrogation, debriefing, liaison, human source contact operations (SCOs), document exploitation (DOCEX), and captured enemy equipment (CEE) operations. DOCEX and CEE operations are activities supported by HUMINT collection but usually are only conducted by HUMINT collectors when the CEE or captured enemy document (CED) is associated with a source being questioned. In some cases, these determinations may depend on legal distinctions between collection methods such as interrogation and debriefing. In others, the distinction is in the purpose of the questioning. For example, screening is used to identify the knowledgeability and cooperation of a source, as opposed to the other activities that are used to collect information for intelligence purposes.

1-15. The activities may be conducted interactively. For example, a HUMINT collector may be screening a potential source. During the course of the screening, the HUMINT collector identifies that the individual has information that can answer requirements. He might at that point debrief or interrogate the source on that specific area. He will then return to screening the source to identify other potential areas of interest.

1-16. HUMINT collection activities vary depending on the source of the information. Once the type of activity has been determined, leaders use the process of plan, prepare, execute, and assess to conduct the activity. The following are the different types of HUMINT collection activities.

TACTICAL QUESTIONING

1-17. Tactical questioning is expedient initial questioning for information of immediate tactical value. Tactical questioning is generally performed by members of patrols, but can be done by any DOD personnel. (See ST 2-91.6.)

SCREENING

1-18. Screening is the process of identifying and assessing the areas of knowledge, cooperation, and possible approach techniques for an individual who has information of intelligence value. Indicators and discriminators used in screening can range from general appearance, possessions, and attitude to specific questions to assess areas of knowledge and degree of cooperation to establish if an individual matches a predetermined source profile. Screening is not in itself an intelligence collection technique but a timesaving measure that identifies those individuals most likely to have information of value.

1-19. Screening operations are conducted to identify the level of knowledge, level of cooperation, and the placement and access of a given source. Screening operations can also assist in the determination of which discipline or agency can best conduct the exploitation. Chapter 6 discusses screening in detail. Screening operations include but are not limited to—

- Mobile and static checkpoint screening, including screening of refugees and DPs.
- Locally employed personnel screening.

- Screening as part of a cordon and search operation.
- EPW and detainee screening.

INTERROGATION

1-20. Interrogation is the systematic effort to procure information to answer specific collection requirements by direct and indirect questioning techniques of a person who is in the custody of the forces conducting the questioning. Some examples of interrogation sources include EPWs and other detainees. Interrogation sources range from totally cooperative to highly antagonistic. Interrogations may be conducted at all echelons in all operational environments. Detainee interrogation operations conducted at a Military Police (MP) facility, coalition-operated facility, or other agency-operated collection facility are more robust and require greater planning, but have greater logistical support. Interrogations may only be conducted by personnel trained and certified in the interrogation methodology, including personnel in MOSs 97E, 351M (351E), or select others as may be approved by DOD policy. Interrogations are always to be conducted in accordance with the Law of War, regardless of the echelon or operational environment in which the HUMINT collector is operating.

DEBRIEFING

1-21. Debriefing is the process of questioning cooperating human sources to satisfy intelligence requirements, consistent with applicable law. The source usually is not in custody and usually is willing to cooperate. Debriefing may be conducted at all echelons and in all operational environments. The primary categories of sources for debriefing are refugees, émigrés, DPs, and local civilians; and friendly forces.

- **Refugees, Émigrés, DPs, and Local Civilians Debriefing Operations.** Refugee, émigré, and DP debriefing operations are the process of questioning cooperating refugees and émigrés to satisfy intelligence requirements. The refugee may or may not be in custody, and a refugee or émigré's willingness to cooperate need not be immediate or constant. Refugee debriefings are usually conducted at refugee collection points or checkpoints and may be conducted in coordination with civil affairs (CA) or MP operations. Local civilian debriefing operations are the process of questioning cooperating local civilians to satisfy intelligence requirements. As with refugees and émigrés, the local civilians being debriefed may or may not be in custody and the civilian's willingness to cooperate may not be immediate or constant. Debriefing operations must be conducted consistent with applicable law and policy. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs.
- **Friendly Force Debriefing Operations.** Friendly force debriefing operations are the systematic debriefing of US forces to answer

collection requirements. These operations must be coordinated with US units. (See Chapter 6.)

LIAISON OPERATIONS

1-22. Liaison operations are programs to coordinate activities and exchange information with host country and allied military and civilian agencies and NGOs.

HUMAN SOURCE CONTACT OPERATIONS

1-23. Human SCO are operations directed toward the establishment of human sources who have agreed to meet and cooperate with HUMINT collectors for the purpose of providing information. Within the Army, SCO are conducted by trained personnel under the direction of military commanders. The entire range of HUMINT collection operations can be employed. SCO sources include one-time contacts, continuous contacts, and formal contacts from debriefings, liaison, and contact operations. SCO consist of collection activities that utilize human sources to identify attitude, intentions, composition, strength, dispositions, tactics, equipment, target development, personnel, and capabilities of those elements that pose a potential or actual threat to US and coalition forces. SCO are also employed to develop local source or informant networks that provide early warning of imminent danger to US and coalition forces and contribute to the Military Decision-Making Process (MDMP). See Chapter 5 for discussion of approval, coordination, and review for each type of activity.

DOCEX OPERATIONS

1-24. DOCEX operations are the systematic extraction of information from open, closed, published, and electronic source documents. These documents may include documents or data inside electronic communications equipment, including computers, telephones, Personal Digital Assistants (PDAs), and Global Positioning System (GPS) terminals. This operation is not solely a HUMINT function, but may be conducted by any intelligence personnel with appropriate language support.

1-25. Many CEDs are associated with EPWs and other human sources. Consequently, a HUMINT collector is often the first person to screen them. HUMINT collectors will screen the documents associated with human sources and will extract information of use to them in their immediate collection operation. Any information discovered during this initial screening that might cross-cue another collection effort will be forwarded to the appropriate unit.

1-26. A captured document is usually something that the enemy has written for his own use. For this reason, captured documents are usually truthful and accurate. There are cases in which falsified documents have been permitted to fall into enemy hands as a means of deception but these cases are not the norm. Normal policy of not relying on single-source information should help prevent deceptions of this type from being effective. Documents also do not forget or misinterpret information although it must be remembered that their authors may have. Usually, each document provides a portion of a

larger body of information. Each captured document, much like a single piece of a puzzle, contributes to the whole. In addition to tactical intelligence, technical data and political indicators that are important to strategic and national level agencies can sometimes be extracted from captured documents. Captured documents, while not affected by memory loss, are often time sensitive; therefore, they are to be quickly screened for possible exploitation.

CEE OPERATIONS

1-27. CEE includes all types of foreign and non-foreign materiel found on a detainee or on the battlefield that may have a military application or answer a collection requirement. The capturing unit must—

- Recognize certain CEE as having immediate intelligence value, and immediately forward such CEE to the unit's S2. Such items include—
  - All electronic communications equipment with a memory card, including computers, telephones, PDAs, and GPS terminals.
  - All video or photographic equipment.
- Recognize certain CEE as having technical intelligence (TECHINT) value. Such items include—
  - New weapons.
  - All communications equipment not immediately exploitable for HUMINT value.
  - Track vehicles.
  - Equipment manuals.
  - All CEE known or believed to be of TECHINT interest.
- Evacuate the equipment with the detainee.
- Confiscate, tag, and evacuate weapons and other equipment found on the detainee the same as CEDs. (See Appendix D.)
- Secure and report the capture of TECHINT items to the unit's S2 for disposition instructions.

TRAITS OF A HUMINT COLLECTOR

1-28. HUMINT collection is a science and an art. Although many HUMINT collection skills may be taught, the development of a skilled HUMINT collector requires experience in dealing with people in all conditions and under all circumstances. Although there are many intangibles in the definition of a "good" HUMINT collector, certain character traits are invaluable:

- **Alertness.** The HUMINT collector must be alert on several levels while conducting HUMINT collection. He must concentrate on the information being provided by the source and be constantly evaluating the information for both value and veracity based on collection requirements, current intelligence, and other information obtained from the source. Simultaneously, he must be alert not only to what the source says but also to how it is said and the accompanying body language to assess the source's truthfulness, degree of cooperation, and current mood. He needs to know when to give the source a break and

when to press the source harder. In addition, the HUMINT collector constantly must be alert to his environment to ensure his personal security and that of his source.

- **Patience and Tact.** The HUMINT collector must have patience and tact in creating and maintaining rapport between himself and the source, thereby enhancing the success of the questioning. Displaying impatience may—
  - Encourage a difficult source to think that if he remains unresponsive for a little longer, the HUMINT collector will stop questioning.
  - Cause the source to lose respect for the HUMINT collector, thereby reducing the HUMINT collector's effectiveness.
- **Credibility.** The HUMINT collector must provide a clear, accurate, and professional product and an accurate assessment of his capabilities. He must be able to clearly articulate complex situations and concepts. The HUMINT collector must also maintain credibility with his source. He must present himself in a believable and consistent manner, and follow through on any promises made as well as never to promise what cannot be delivered.
- **Objectivity and Self-control.** The HUMINT collector must also be totally objective in evaluating the information obtained. The HUMINT collector must maintain an objective and dispassionate attitude regardless of the emotional reactions he may actually experience or simulate during a questioning session. Without objectivity, he may unconsciously distort the information acquired. He may also be unable to vary his questioning and approach techniques effectively. He must have exceptional self-control to avoid displays of genuine anger, irritation, sympathy, or weariness that may cause him to lose the initiative during questioning but be able to fake any of these emotions as necessary. He must not become emotionally involved with the source.
- **Adaptability.** A HUMINT collector must adapt to the many and varied personalities which he will encounter. He must also adapt to all types of locations, operational tempos, and operational environments. He should try to imagine himself in the source's position. By being adaptable, he can smoothly shift his questioning and approach techniques according to the operational environment and the personality of the source.
- **Perseverance.** A tenacity of purpose can be the difference between a HUMINT collector who is merely good and one who is superior. A HUMINT collector who becomes easily discouraged by opposition, non-cooperation, or other difficulties will not aggressively pursue the objective to a successful conclusion or exploit leads to other valuable information.
- **Appearance and Demeanor.** The HUMINT collector's personal appearance may greatly influence the conduct of any HUMINT collection operation and attitude of the source toward the HUMINT collector. Usually an organized and professional appearance will favorably influence the source. If the HUMINT collector's manner

reflects fairness, strength, and efficiency, the source may prove more cooperative and more receptive to questioning.

- **Initiative.** Achieving and maintaining the initiative are essential to a successful questioning session just as the offensive is the key to success in combat operations. The HUMINT collector must grasp the initiative and maintain it throughout all questioning phases. This does not mean he has to dominate the source physically; rather, it means that the HUMINT collector knows his requirements and continues to direct the collection toward those requirements.

REQUIRED AREAS OF KNOWLEDGE

1-29. The HUMINT collector must be knowledgeable in a variety of areas in order to question sources effectively. The collector must prepare himself for operations in a particular theater or area of intelligence responsibility (AOIR) by conducting research. The G2 can be a valuable source of information for this preparatory research. The HUMINT collector should consult with order of battle (OB) technicians and analysts and collect information from open sources and from the Secret Internet Protocol Router Network (SIPRNET) to enhance his knowledge of the AOIR. Some of these areas of required knowledge are—

- **The area of operations (AO)** including the social, political, and economic institutions; geography; history; language; and culture of the target area. Collectors must be aware of all ethnic, social, religious, political, criminal, tribal, and economic groups and the interrelationships between these groups.
- **All current and potential threat forces** within the AOIR and their organization, equipment, motivation, capabilities, limitations, and normal operational methodology.
- **Applicable law and policy that might affect HUMINT collection activities. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs.** HUMINT collectors are subject to applicable law, which includes US law, the law of war (including the Geneva Conventions as applicable), and relevant international law. Additionally, local agreements with HNs or allies and the applicable execute orders and rules of engagement (ROE) may further restrict HUMINT collection activities. However, these documents cannot permit interrogation actions that would be illegal under applicable US or international law.
- **The collection requirements,** including all specific information requirements (SIRs) and indicators that will lead to the answering of the intelligence requirements.

- **Cultural awareness** in the various AOs will have different social and regional considerations that affect communications and can affect the conduct of operations. These may include social taboos, desired behaviors, customs, and courtesies. The staff must include this information in pre-deployment training at all levels to ensure that personnel are properly equipped to interact with the local populace.

1-30. There are other areas of knowledge that help to develop more effective questioning:

- **Proficiency in the target language**. The HUMINT collector can normally use an interpreter (see Chapter 11) and machine translation as they are developed to conduct questioning. Language proficiency is a benefit to the HUMINT collector in a number of ways: He can save time in questioning, be more aware of nuances in the language that might verify or deny truthfulness, and better control and evaluate interpreters.
- **Understanding basic human behavior**. A HUMINT collector can best adapt himself to the source's personality and control of the source's reactions when he understands basic behavioral factors, traits, attitudes, drives, motivations, and inhibitions. He must not only understand basic behavioral principles but also know how these principles are manifested in the area and culture in which he is operating.
- **Neurolinguistics**. Neurolinguistics is a behavioral communication model and a set of procedures that improve communication skills. The HUMINT collector should read and react to nonverbal communications. He must be aware of the specific neurolinguistic clues of the cultural framework in which he is operating.

CAPABILITIES AND LIMITATIONS

CAPABILITIES

1-31. HUMINT collection capabilities include the ability to—

- Collect information and cross-cue from an almost endless variety of potential sources including friendly forces, civilians, detainees, and source-related documents.
- Focus on the collection of detailed information not available by other means. This includes information on threat intentions and local civilian and threat force attitudes and morale. It also includes building interiors and facilities that cannot be collected on by other means due to restrictive terrain.
- Corroborate or refute information collected from other R&S assets.
- Operate with minimal equipment and deploy in all operational environments in support of offensive, defensive, stability and reconstruction operations, or civil support operations. Based on solid planning and preparation, HUMINT collection can provide timely information if deployed forward in support of maneuver elements.

LIMITATIONS

1-32. HUMINT collection limitations include—

- Interpersonal abilities. HUMINT is dependent on the subjective interpersonal capabilities of the individual rather than on the abilities to operate collection equipment. HUMINT collection capability is based on experience within a specific AO that can only be developed over time.
- Identification of knowledgeable sources. There is often a multitude of potential HUMINT sources. Information in response to specific requirements can only be collected if sources are available and identified that have that information.
- Limited numbers. There are never enough HUMINT collectors to meet all requirements. Limited assets must be prioritized in support of units and operations based on their criticality.
- Time limitations. HUMINT collection, particularly source operations, takes time to develop. Collection requirements must be developed with sufficient lead-time for collection.
- Language limitations. Although HUMINT collectors can normally use an interpreter, a lack of language proficiency by the collector can significantly slow collection efforts. Such language proficiency takes time to develop.
- Misunderstanding of the HUMINT mission. HUMINT collectors are frequently used incorrectly and assigned missions that belong to CA, MP, interpreter or translators, CI, or other operational specialties.
- Commanders' risk management. Maneuver commanders, in weighing the risks associated with employing HUMINT collection teams (HCTs), should seriously consider the potential loss of a wealth of information such as enemy activities, locations of high-value personnel, and threats to the force that they will incur if they restrict HCT collection activities. J/G2Xs, operational management teams (OMTs), and HCT leaders must educate maneuver commanders on the benefits of providing security for HCTs and employing them in accordance with their capabilities.
- Legal obligations. Applicable law and policy govern HUMINT collection operations. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs. HUMINT operations may be further restricted by Status of Forces Agreements (SOFAs) and other agreements, execute orders and ROE, local laws, and an operational umbrella concept. Such documents, however, cannot permit interrogation actions that are illegal under applicable law.
- Connectivity and bandwidth requirements. With the exception of the size, activity, location, unit, time, equipment (SALUTE) report, most HUMINT reporting requires considerable bandwidth. Deployed

HUMINT teams must be able to travel to, and report from, all areas of the battlefield. Digital communication equipment must be able to provide reliable connectivity with teams' reporting channels and sufficient bandwidth for transmission of reports, including digital imagery.

- Timely reporting and immediate access to sources. Except in tactical situations when HUMINT collectors are in immediate support of maneuver units, HUMINT collection and reporting takes time. In stability and reconstruction operations, sources need to be assessed and developed. Once they are developed, they need to be contacted which often takes time and coordination. In offensive and defensive operations, HUMINT collection at detainee holding areas sometimes may still be timely enough to meet tactical and operational requirements. See paragraphs 3-2 and 3-7 for more information on offensive and defensive operations.

Chapter 2

Human Intelligence Structure

ORGANIZATION AND STRUCTURE

2-1. The success of the HUMINT collection effort depends on a complex interrelationship between command and control (C2) elements, requirements, technical control and support, and collection assets. Each echelon of command has its supporting HUMINT elements although no MI organization in the Army is robust enough to conduct sustained HUMINT operations under all operational environments using only its organic HUMINT assets. HUMINT units have specific support requirements to the commander. HUMINT units must be flexible, versatile, and prepared to conduct HUMINT collection and analysis operations in support of any echelon of command. A coherent C2 structure within these HUMINT organizations is necessary in order to ensure successful, disciplined, and legal HUMINT operations. This structure must include experienced commissioned officers, warrant officers, and senior NCOs conscientiously discharging their responsibilities and providing HUMINT collectors with guidance from higher headquarters.

2-2. Regardless of the echelon, there are four basic elements that work together to provide the deployed commander with well-focused, thoroughly planned HUMINT support. The four elements are staff support, analysis, C2, and collection. Each piece of the infrastructure builds on the next and is based on the size, complexity, and type of operation as shown in Figure 2-1.

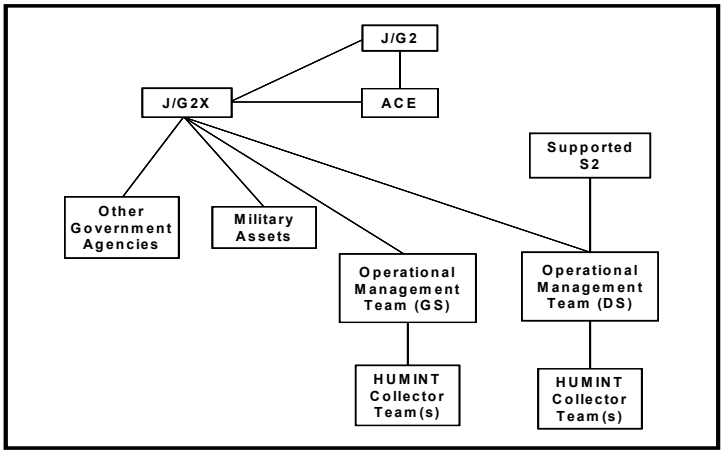

Figure 2-1. Tactical HUMINT Organization.

HUMINT CONTROL ORGANIZATIONS

2-3. HUMINT control organizations are the means by which a commander exercises command of a unit's operations. HUMINT control organizations are vital to the effective use of HUMINT collection assets. HUMINT control organizations consist of the C/J/G/S2X and the HUMINT operations cell (HOC) at the brigade and above level and the OMTs at the battalion and below level.

C/J/G/S2X

2-4. The C/J/G/S2X is a staff element subordinate to the C/J/G/S2, is the primary advisor on HUMINT and CI, and is the focal point for all HUMINT and CI activities within a joint task force (JTF) (J2X), an Army component task force (G2X) or a brigade combat team (BCT) (S2X). The 2X can be organic to the unit staff or can be attached or under operational control (OPCON) to the staff from another organization such as the theater MI brigade. The C/J/G/S2X is part of a coherent architecture that includes organic HUMINT assets and HUMINT resources from national, theater, and non-DOD HUMINT organizations.

2-5. The C/J2X is responsible for controlling Joint Force HUMINT assets, coordinating all HUMINT and CI collection activities, and keeping the joint force C/J/2 informed on all HUMINT and CI activities conducted in the joint force area of responsibility (AOR). The C/J2X is also part of the review and recommendation process concerned with the retention or release of detainees. HUMINT reports maintained at the C/J2X are considered during the review for release process. The C/J2X consists of the 2X Officer, a HOC, a Counterintelligence Coordination Authority (CICA), a HUMINT Analysis Cell (HAC), and a CI Analysis Cell (CIAC). At all echelons, the 2X should also include an Operational Support Cell (OSC) staffed to operate 24 hours a day. The authority and operational responsibilities of a C/J2X in combined or joint contingency operations (CONOP) takes precedence over service-specific CI and HUMINT technical control agencies. Specifically, the C/J/G/S2X—

- Accomplishes technical control and support, and deconfliction of all HUMINT and CI assets through the Army component G2X, the HUMINT and CI operations sections, or the OMTs.
- Participates in planning for deployment of HUMINT and CI assets in support of operations.
- Coordinates, through the HOC and the CICA, all HUMINT and CI activities to support intelligence collection and the intelligence aspects of force protection for the deployed commander.
- Coordinates and deconflicts all HUMINT and CI operations within the operational area.
- Coordinates with the senior US national intelligence representative for specific operational approval when required by standing agreements.
- Is the release authority for HUMINT reporting at his echelon and only releases reports to the all-source system after ensuring all technical control measures for reporting have been met.

- Coordinates with other HUMINT collection agencies not under the control of the command, such as Defense Intelligence Agency (DIA), Central Intelligence Agency (CIA), and Federal Bureau of Investigation (FBI).
- Does not exercise OPCON over HUMINT and CI assets assigned, attached, or reinforcing the unit; however, he is the staff support responsible for creating a cohesive HUMINT and CI effort.
- Coordinates with non-DOD agencies conducting HUMINT collection operations in the joint area of operations (JAO) to ensure deconfliction of sources, informants, or contacts and the HUMINT reporting that is generated by these collection operations.

2-6. The J2X will maintain technical control (see para 4-10) of all CI investigative actions within its AOIR; however, all investigative matters will be in accordance with DOD policies, joint or Military Department doctrine, applicable US law and policy, SOFAs, or other International Standardization Agreements (ISAs). The J2X will advise the responsible Theater CICA (TCICA) of any Army CI element conducting investigative activities that fall under the purview of AR 381-20.

OPERATIONS SUPPORT CELL (OSC)

2-7. The OSC in the C/J/G/S2X staff will maintain the consolidated source registry for all HUMINT and CI activities in the unit's designated AOIR. The OSC will provide management of intelligence property book operations, source incentive programs, and intelligence contingency funds (ICFs) for subordinate HUMINT and CI elements. The OSC responsibilities also include requests for information (RFIs) and/or source-directed requirements (SDRs) management and the release of intelligence information reports (IIRs).

COUNTERINTELLIGENCE COORDINATION AUTHORITY

2-8. The CICA is assigned under the J/G2X and coordinates all CI activities within its designated AOIR. (See FM 34-60 for a detailed explanation of the CI mission.) The CICA—

- Provides technical support to all CI assets and coordinates and deconflicts CI activities in the deployed AOIR.
- Coordinates and supervises CI investigations and collection activities conducted by all services and components in the AOIR.
- Establishes and maintains the theater CI source database.
- Coordinates with the HOC for CI support to detention, interrogation, refugee, and other facilities.
- Manages requirements and taskings for CI collectors in the AO in coordination with the HOC.
- Expedites preparation of CI reports and their distribution to consumers at all levels.
- Coordinates CI activities with senior CI officers from all CI organizations on the battlefield.

- Performs liaison with HN and US national level CI organizations.
- Informs the appropriate TCICA when Army CI elements are conducting CI investigative activities within the purview of AR 381-20.

HUMINT OPERATIONS CELL

2-9. The HOC is assigned under the J/G2X to track all HUMINT activities in the AOIR. The J/G2X uses this information to advise the senior intelligence officer (SIO) on all HUMINT activities conducted within the AOIR. The HOC—

- Provides technical support to all HUMINT collection operations and deconflicts HUMINT collection operations in the designated AOIR.
- Establishes and maintains a consolidated HUMINT source database in coordination with the CICA.
- Coordinates with collection managers and the HAC to identify collection requirements and to ensure requirements are met.
- Coordinates the activities of HUMINT collectors assigned or attached to interrogation, debriefing, refugee, DOCEX, and other facilities.
- Manages requirements and taskings for HUMINT collectors in the AOIR, in coordination with the CICA.
- Expedites preparation of intelligence reports and their distribution to consumers at all levels.
- Performs liaison with HN and US national HUMINT organizations.

OPERATIONAL MANAGEMENT TEAM

2-10. A HUMINT OMT consists of senior individuals in MOS 351M (351E) and MOS 97E. Each OMT can control 2 to 4 HCTs depending upon assigned mission and operational tempo (OPTEMPO). The OMT performs a necessary function when two or more HCTs deploy by assisting the HUMINT element commander in tasking and providing technical support to assigned or attached HCTs. The OMT is optimally collocated with the command post (CP) of the supported unit. However, it must be located where it can provide oversight of team operations and best support the dissemination of tasking, reports, and technical data between the unit and the deployed collection assets. When a higher echelon augments subordinate elements with collection teams, it should include proportional OMT augmentation. When a single collection team is attached in direct support (DS) of a subordinate element, the senior team member exerts mission and technical control over the team. The OMT—

- Provides operational and technical control and guidance to deployed HCTs.
- Normally consists of a WO and noncommissioned officers (NCOs) whose experience and knowledge provide the necessary guidance for effective team collection operations.
- Manages the use of ICFs and incentives for the HCTs.
- Provides the collection focus for HCTs.

- Provides quality control and dissemination of reports for subordinate HCTs.
- Directs the activities of subordinate HCTs and controls their operations.
- Conducts limited single-discipline HUMINT analysis and mission analysis for the supported commander.
- Acts as a conduit between subordinate HCTs, the HOC, and the C/J/G/S2X.
- Reports the HCT mission and equipment status to the HOC and the command element.

HUMINT COLLECTION TEAM

2-11. HCTs are the elements that collect information from human sources. The HUMINT collectors deploy in teams of approximately four personnel in MOS 97E (HUMINT Collector) and MOS 351M (351E) (HUMINT Technician).

2-12. The HCT may be augmented based on factors of mission, enemy, terrain and weather, troops and support available, time available, and civil considerations (METT-TC). Interpreters from the RC or civilian contractors with appropriate security clearances are added when necessary. TECHINT personnel or other specific subject-matter experts (SMEs) may augment the team to meet technical collection requirements. Another example would be pairing HUMINT collectors with dedicated analysts to provide sharper focus to the interrogation effort. In fixed detention facilities, these HUMINT collector or analyst relationships may become more enduring. Commanders are not encouraged to mix HUMINT collectors and CI agents on a single team. Doing so seriously undermines the ability to conduct both the HUMINT collection and CI missions simultaneously. However, commanders may find times when METT-TC factors make it reasonable to augment a CI team with HUMINT support for a mission, or vice versa.

COMMAND DEBRIEFING TEAM

2-13. A command debriefing team is normally not a table of organization and equipment (TOE) organization but may be task organized to meet mission requirements. This task-organized team is normally OPCON to the HOC. Although more prevalent during stability and reconstruction operations, senior personnel will often acquire information of intelligence interest during the normal course of their duties. The HUMINT collection assets, particularly at division echelon or higher, will normally task organize a team of more senior, experienced individuals to debrief these senior unit personnel. In offensive and defensive operations, this same team is prepared to interrogate high-value detainees (including EPWs) or debrief senior civilians. The command debriefing team should not be confused with the G2/S2 debriefing program, which also is critical and is an important conduit of information.

DOCUMENT EXPLOITATION TEAM

2-14. DOCEX teams are normally found at theater and national level organizations. Lower echelon HCTs may also be designated to perform the DOCEX mission based upon mission parameters and linguist availability. However, if organic assets are used, there will be a mission tradeoff. Dependent on the priority of exploitation and volume of documents, HCTs assigned the DOCEX mission may be augmented by military, civilian, or contractor personnel to accomplish their assigned mission. During operations, the DOCEX team will normally screen documents, extract information, and expedite the evacuation of documents to the Joint or Theater Document Exploitation Facility.

HUMINT ANALYSIS AND PRODUCTION ORGANIZATIONS

2-15. HUMINT analysis and production organizations analyze information collected from HUMINT sources, support the requirements management (RM) system, and produce single-discipline intelligence products. HUMINT analysis and production are conducted at all echelons, separate brigades, and higher. (See Chapter 12 for a description of the HUMINT analysis system and methodologies.)

HUMINT ANALYSIS CELL

2-16. The HAC is part of the J/G2X; however, it may be collocated with an analysis and control element (ACE) or Joint Intelligence Support Element (JISE) single-source enclave depending on facilities and operational environment considerations. The HAC works closely with the all-source intelligence elements and the CIAC to ensure that HUMINT reporting is incorporated into the all-source analysis and common operational picture (COP). The HAC is the "fusion point" for all HUMINT reporting and operational analysis in the JISE and ACE. It determines gaps in reporting and coordinates with the RM to cross-cue other intelligence sensor systems. The HAC—

- Produces and disseminates HUMINT products and provides input to intelligence summaries (INTSUMs).
- Uses analytical tools found at the ACE or JISE to develop long-term analyses and provides reporting feedback that supports the HOC, OMTs, and HCTs.
- Provides analytical expertise to the C/J/G/S2X, HOC, and OMTs.
- Produces country and regional studies tailored to HUMINT collection.
- Compiles target folders to assist C/J/G/S2X assets in focusing collection efforts.
- Analyzes and reports on trends and patterns found in HUMINT reporting.
- Analyzes source reliability and credibility as reflected in reporting and communicates that analysis to the collector.
- Develops and maintains databases specific to HUMINT collection activities.
- Produces HUMINT requirements.

- Answers HUMINT-related RFIs.
- Identifies collection gaps and provides context for better collection at their echelon.

JOINT INTERROGATION AND DEBRIEFING CENTER ANALYSIS SECTION

2-17. This section ensures that all members of the Joint Interrogation and Debriefing Center (JIDC) (see para 5-102) are aware of the current situation through the distribution of INTSUMs and products from external agencies. The Analysis Section also supports the JIDC by—

- Providing situation update briefings to all facility personnel every 12 hours.
- Preparing research and background packets and briefings for interrogations and debriefings.
- Developing indicators for each intelligence requirement to support screening operations.
- Conducting single-discipline HUMINT analysis based on collected information to support further collection efforts.
- Correlating reports produced by the JIDC to facilitate analysis at higher levels.
- Answering RFIs from interrogators and formulating RFIs that cannot be answered by the analytical section on behalf of the interrogators.
- Reviewing IIRs and extracting information into analysis tools tailored to support the interrogation process.
- Pursuing products and resources to support the interrogation effort.

HUMINT ANALYSIS TEAM

2-18. The HUMINT analysis team (HAT) is subordinate to the G2 ACE. The HAT supports the G2 in the development of IPB products and in developing and tailoring SIRs to match HUMINT collection capabilities.

Chapter 3

HUMINT in Support of Army Operations

3-1. Army doctrine for full spectrum operations recognizes four types of military operations: offensive, defensive, stability and reconstruction, and civil support. Missions in any environment require the Army to conduct or be prepared to conduct any combination of these operations. HUMINT assets will be called on to provide information in support of all four operations. Simultaneous operations, for example elements of a force conducting offensive operations while other elements are engaged in stability and reconstruction operations, will cause a similar division of the limited HUMINT assets based on METT-TC.

OFFENSIVE OPERATIONS

3-2. Offensive operations aim at destroying or defeating the enemy. Rapid maneuver, constantly changing situations, and a vital need for intelligence support at the point of contact influence HUMINT missions during offensive operations. The guiding principle to the use of HUMINT in support of offensive operations is to minimize the time between when friendly forces encounter potential sources (detainees, refugees, and local civilians) and when a HUMINT collector screens them.

3-3. During offensive operations, at echelons corps and below, HCTs normally operate in the engaged maneuver brigades' AOs and are further deployed in support of maneuver battalions based on advice from the OMTs. These collection assets may be in general support (GS) of the parent brigade or in DS of the maneuver battalions, reconnaissance squadrons, and other forward-deployed maneuver assets. The HCTs and their supporting control structure are deployed in accordance with METT-TC based on three principles:

- The relative importance of that subordinate element's operations to the overall parent unit's scheme of maneuver and the overall ISR plan.
- The potential for that subordinate element to capture detainees, media and materiel, or to encounter civilians on the battlefield.
- The criticality of information that could be obtained from those sources to the success of the parent unit's overall OPLANs.

3-4. HUMINT missions in support of offensive operations include screening and interrogating EPWs and other detainees, questioning and debriefing civilians in the supported unit's AO, and conducting DOCEX, limited to extracting information of immediate tactical value. EAC assets normally support offensive operations through theater interrogation and debriefing facility operations and mobile interrogation teams. These facilities are better equipped to conduct in-depth interrogations and DOCEX, so it is imperative

that EPWs and other detainees who will be evacuated to theater facilities be transported there as soon as possible.

HUMINT IN SUPPORT OF FORCED ENTRY OPERATIONS

3-5. Forced entry operations (FEOs) are offensive operations conducted to establish an initial military presence in a target area in the face of expected enemy opposition. HUMINT collection assets may be able to provide vital information to tactical commanders in the critical early stages of the entry operation. Key considerations for HUMINT support to FEOs include:

- HUMINT collectors attached or under OPCON of the initial force package to provide HUMINT collection support for the entry force. Collection teams will normally operate in support of battalion-sized or smaller elements. HUMINT collection assets should be integrated early and should participate in all aspects of planning and training, including rehearsals, to smoothly integrate and execute operations.
- HUMINT assets supporting the entry force must include proportional OMT elements. For example, if 2 to 4 teams are attached to a maneuver brigade, an OMT also needs to be attached. Even if the teams are further attached to maneuver battalions, there must be an OMT at the brigade level to coordinate and control HUMINT collection activities.
- HCTs and OMTs must be as mobile and as survivable as the entry forces. Team leaders should ensure that the supported unit will be able to provide maintenance support to the team vehicles, as appropriate, in accordance with the support relationship.
- Attached or OPCON HUMINT teams must have robust communications connectivity with the supported unit and must have reach connectivity through their OMT.
- HCTs must contain organic or attached language capability in order to conduct HUMINT collection effectively during FEO. It is unlikely that the teams can be augmented with attached civilian interpreters during this type of operation.

HUMINT IN SUPPORT OF EARLY ENTRY OPERATIONS

3-6. Early entry operations differ from FEOs in that early entry operations do not anticipate large-scale armed opposition. Early entry operations establish or enhance US presence, stabilize the situation, and shape the environment for follow-on forces. HUMINT collection provides critical support to defining the operational environment and assessing the threat to US forces. The considerations listed above for FEOs apply equally to early entry operations.

DEFENSIVE OPERATIONS

3-7. Defensive operations defeat an enemy attack, buy time, economize forces, hold the enemy in one area while attacking in another, or develop conditions favorable for offensive operations. Forces conducting defensive

operations must be able to identify rapidly the enemy's main effort and rapidly assess the operational conditions to determine the timing of counter-offensive or other operations. HUMINT support to defensive operations centers on the ability to provide the forward-deployed maneuver commander with information and intelligence of immediate tactical value. HUMINT assets should be placed in the AO of the forward elements to minimize the time between when friendly forces encounter potential sources (detainees, refugees, local civilians) and when a HUMINT collector screens them. HUMINT collectors are placed where the potential for HUMINT collection and the criticality of the information are greatest.

3-8. In defensive operations, it may be necessary to divide the HUMINT assets equally among the subordinate elements to provide area coverage until the primary enemy threat is identified. The HUMINT C2 elements (team leader, OMTs, and unit C2) must be prepared to task organize rapidly and shift resources as the situation dictates, based on the changing situation and higher headquarters FRAGO. HUMINT missions in defensive operations normally include interrogation of detainees, refugee debriefings, and assisting in friendly force patrol debriefings.

STABILITY AND RECONSTRUCTION OPERATIONS

3-9. Stability and reconstruction operations sustain and exploit security and control over areas, populations, and resources. They employ military and civilian capabilities to help establish order that advances US interests and values. The immediate goal often is to provide the local populace with security, restore essential services, and meet humanitarian needs. The long-term goal is to help develop indigenous capacity for securing essential services, a viable market economy, rule of law, democratic institutions, and robust civil society. Stability and reconstruction operations involve both coercive and cooperative actions. They may occur before, during, and after offensive and defensive operations; however, they also occur separately, usually at the lower end of the range of military operations. The primary focus of the HCTs during stability and reconstruction operations is to answer the commander's information requirements (IRs) and provide support to force protection. In stability and reconstruction operations, the HUMINT collectors must be able to maintain daily contact with the local population. The nature of the threat in stability operations can range from conventional forces to terrorists and organized crime and civil disturbances. Consequently, intelligence requirements can vary greatly. Examples of HUMINT collection requirements include TECHINT to support arms control; extensive political information and demographic data; order of battle (OB) regarding several different former warring factions during peace operations; or extremely detailed target data. HUMINT collectors also help to ascertain the feelings, attitudes, and activities of the local populace. Stability and reconstruction operations may be conducted in coordination with other US departments and agencies, and in conjunction with other countries and international organizations.

3-10. Centralized management and databasing are key to successful HUMINT operations. The HUMINT assets may operate in GS to the parent unit or operate in the AO of subordinate elements of the parent unit. For

example, in a division AO, the HCTs would normally operate in DS to the division but each team would normally have an AOIR that corresponds to the AO of the division's brigades or battalion task forces. There is close coordination between the HUMINT staff officer (C/J/G/S2X) and the OMTs to synchronize HUMINT operations properly, to develop the overall threat awareness, and to deconflict sources. The HCTs screen and debrief contacts to increase the security posture of US forces, to provide information in response to command collection requirements, and to provide early warning of threats to US forces. They may also interrogate detainees if permitted to do so by the mission-specific orders and in accordance with applicable law and policy. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs.

3-11. Many stability and reconstruction operations are initiated with the establishment of a lodgment or base area. There is a subsequent expansion of operations to encompass the entire AO. The general concept of an HCT's operation is that of a two-phased effort. In the initial phase, the HCT establishes concentric rings of operations around the US forces starting from the supported unit's base of operations and working outward. Each ring is based on the threat environment and the commander's need to develop his knowledge of the tactical situation. The second, or continuation phase, begins once the initial information collection ring is established. The initial ring is not abandoned but rather is added to as the HCT shifts its focus to expand and establish the second and successive rings. The amount of time spent establishing each ring is situationally dependent.

INITIAL PHASE

3-12. The initial phase of stability and reconstruction operations is used to lay the foundation for future team operations. In general, the priority of effort is focused inward on security. The HCT conducts initial and follow-up screenings of locally employed personnel, to establish base data for subsequent source operations. The supported unit S2, with the assistance of the HUMINT team leader, establishes procedures to debrief reconnaissance and surveillance assets operating in the supported unit AO, as well as regular combat patrols or logistics convoys. The HCT lays the groundwork for future collection efforts by establishing liaison with local authorities, as well as developing plans and profiles for HUMINT collection. While establishing the initial and subsequent rings, the HCT actively seeks to collect PIR information, whether it pertains to the current ring or any other geographic location.

CONTINUATION PHASE

3-13. Following the initial phase, the HCT's focus shifts outward. While the HCT continues performing HUMINT collection and analysis functions within the base camp, it also expands its collection effort to outside the base camp to answer the supported unit's requirements. During the continuation phase, the HCT conducts contact operations with local personnel who may be able to

provide information of interest to the local commander or to satisfy the requirements of the tasking or request. The HCT also conducts liaison with local authorities, coalition forces (if present), NGOs, and others whose knowledge or activities may affect the success of the US mission. Any time the HCT is outside the base camp, it must be careful to observe the local population and report what it sees. The activities and attitudes of the general population will often have an effect on the commander's decisions on how to conduct US missions in the area.

LEVELS OF EMPLOYMENT

3-14. HCTs may be employed with varying degrees of contact with the local population. As the degree of contact with the population increases, the quantity and diversity of HUMINT collection increases. In many instances, however, there is a risk to the HCT inherent with increased exposure to the local population. The ability of the HCT members to fit in with the local populace can become very important to their safety. Consequently, the commander should consider exceptions to the ROE, as well as relaxed grooming and uniform standards, to help HCT members blend in and provide additional security. Commanders must consider the culture in which the HCT members will be operating. In some cultures, bearded men are more highly respected than clean-shaven men. Relaxing grooming standards for HCTs in these situations will support the team's ability to collect information. The decision regarding what level to employ an HCT is METT-TC dependent. The risk to the collection assets must be balanced with the need to collect information and to protect the force as a whole. The deployment and use of HUMINT collection assets may be limited by legal restrictions, mission-specific orders, directions from higher headquarters, and the overall threat level. The four basic levels of employment for the HCT are discussed below. Figure 3-1 shows these levels as well as their collection potential versus team security.

Base Camp

- Restricting the HCT to operations within the base camp minimizes the risk to the team. This action, however, minimizes the collection potential and maximizes the risk to the force as a whole. While restricted to a base camp, the HCT can maintain an extremely limited level of information collection by—
  - Interviewing walk-in sources and locally employed personnel.
  - Debriefing combat and ISR patrols.
  - Conducting limited local open-source information collection.
- This mode of deployment should be used only when dictated by operational restrictions. These would be at the initial stages of stability and reconstruction operations when the operational environment is being assessed, or as a temporary expedient when the force protection level exceeds the ability to provide reasonable protection for the collectors. A supported unit commander is often tempted to keep the HCT "inside the wire" when the force protection level or threat

condition (THREATCON) level increases. The supported unit and parent commanders must compare the gains of the HCT collection effort with the risks posed. This is necessary especially during high THREATCON levels when the supported unit commander needs as complete a picture as possible of the threat arrayed against US or multinational forces.

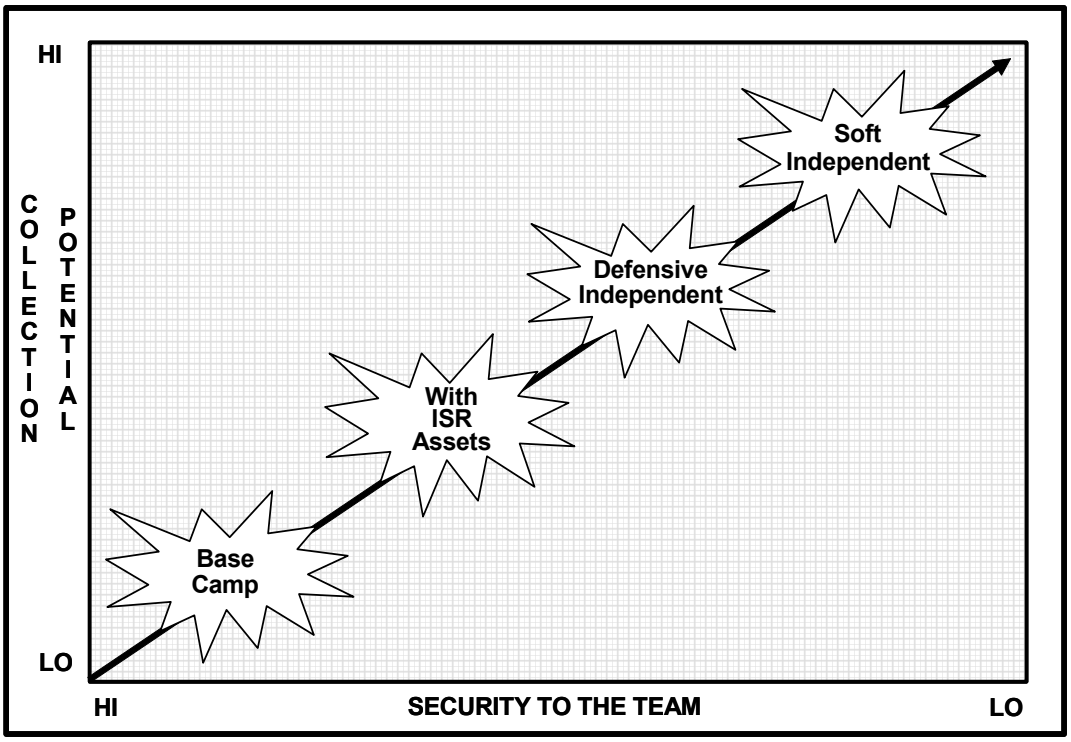

Figure 3-1. Team Level of Employment.

Integrated with Other Operations

- Under some circumstances, when it is not expedient to deploy the HCT independently due to threat levels or other restrictions, it can be integrated into other ongoing operations. The HCT may be employed as part of a combat patrol, ISR patrol, or in support of an MP patrol or stationed at a checkpoint or roadblock. It can also be used to support CA, psychological operations (PSYOP), engineer, or other operations. This method reduces the risk to the team while greatly increasing its collection potential over the confined-to-base-camp method. It has the advantage of placing the team in contact with the local population and allowing it to spot, assess, and interact with potential sources of information.
- The integration into other operations can also facilitate the elicitation of information. However, this deployment method restricts collection by subordinating the team's efforts to the requirements, locations, and timetables of the unit or operation into which it is integrated. Integration can be done at the team or individual collector level. HUMINT collectors should be used only in situations with an

intelligence collection potential. It is a waste of a valuable asset to use them in a function that could be performed by a civilian translator.

As an Independent Patrol

- Defensive. One of the key elements of the HCT success is the opportunity to spot, assess, and develop relationships with potential sources of information. Operating as independent patrols, without being tied to ISR or combat assets, enables the HCTs maximum interaction with the local population, thereby maximizing the pool of potential sources of information. The HCT must be integrated into the supported unit's ISR plan and be provided with other command elements as needed to support the collection mission. The team leader will advise the supported unit on the specific capabilities and requirements of the team to maximize mission success. This method also increases the risk to the team. HCT members must carry the necessary firepower for self-protection. They must also have adequate communications equipment to call for help if needed. The team's posture, equipment, and appearance will be dictated by overall force restrictions and posture. When operating as an independent patrol, the HCT should not stand out from overall US forces operations. If US forces are in battle-dress uniforms and operating out of military vehicles, so should the HUMINT collectors.
- Soft. If the threat situation is such that soldiers are authorized to wear civilian clothes when outside base areas, the HUMINT collectors should also move among the civilian population in civilian clothes, so that they do not stand out from others in the area.

CIVIL SUPPORT OPERATIONS

3-15. Army support supplements the efforts and resources of state and local governments and organizations. If a presidential declaration initiates civil support for a major disaster or emergency, involvement of DOD intelligence components would be by exception. Civil support requires extensive coordination and liaison among many organizations—interagency, joint, AC, and RC—as well as with state and local governments, and in any case will require compliance with the Posse Comitatus Act, 18 U.S.C., § 1385, when US forces are employed to assist Federal, state, or local law enforcement agencies (LEAs). The National Response Plan provides a national level architecture to coordinate the actions of all supporting agencies.

MILITARY OPERATIONS IN URBAN ENVIRONMENT

3-16. Units are often task organized with additional ISR units and assets to meet the detailed collection requirements in the urban operations. The complexities of urban terrain cause degradation in the capabilities of many of the sensor systems. HUMINT collectors may have to be placed in DS of lower echelon combat maneuver forces (battalion and lower) to support operations. HUMINT and combat reporting by units in direct contact with threat forces and local inhabitants becomes the means of collection. For successful ISR

planning, the S2 must be aware of the capabilities and limitations of the various organic and attached collection systems as they apply to urban operations. As in all environments, commanders must assess the risk involved in the forward deployment of HUMINT assets.

3-17. In urban operations, people (for example, detainees and civilians) are the preeminent source of information. HUMINT collection provides information not otherwise available through signals intelligence (SIGINT) and imagery intelligence (IMINT) such as threat and local population intentions. They collect information on, for example, floor plans, defensive plans, locations of combatants and noncombatants, including civilians in the buildings and surrounding neighborhoods, and other information. The collected information is passed directly to the individuals conducting the combat operation.

3-18. In small-scale contingencies (SSCs) and in peacetime military engagements (PMEs), contact with local officials and populace by the HUMINT collectors can be a prime source of information about the local environment and is a vital component of intelligence support to force protection. During routine patrolling of urban areas it is often expedient to place a HUMINT collector with individual patrols. The key difference between urban and other operations, from major theater war (MTW) to PME, is the number of HUMINT collectors required. The need for HUMINT collectors is a function of population density. Whereas in a rural environment, a HUMINT team may be able to cover an area in excess of 1,200 square kilometers; the same team in a dense urban environment may be able to cover only 10 square blocks or less.

HUMINT COLLECTION ENVIRONMENTS

HUMINT COLLECTION IN A PERMISSIVE ENVIRONMENT

3-19. In a permissive environment, HCTs normally travel throughout their specific AOR as separate teams or as part of a larger reconnaissance team. HUMINT collectors may frequently make direct contact with the individual, view the activity, or visit the area that is the subject of the ISR effort. They normally use debriefing and elicitation to obtain first-hand information from local civilians and officials as their primary collection techniques. Additional information can be obtained from exploitation of open-source material such as newspapers, television, and other media. The priority requirements in this environment are normally linked to force protection. HCTs should establish liaison and casual source contacts throughout their AOIR. Reporting is normally via IIRs, although SALUTE reports are used for critical time-sensitive reporting. Even in a permissive environment, the HUMINT collector conducts the majority of his collection through the debriefing of individuals who have first-hand knowledge of the information they are reporting.

HUMINT COLLECTION IN A SEMI-PERMISSIVE ENVIRONMENT

3-20. In a semi-permissive environment, security considerations increase, but the risk to the collector still must be weighed against the potential intelligence gain. HCTs should still be used throughout their AOIR but will normally be integrated into other ground reconnaissance operations or other planned operations. For example, a HUMINT collector may accompany a CA team or PSYOP team visiting a village. Security for the team and their sources is a prime consideration. The HCTs are careful not to establish a fixed pattern of activity and arrange contacts in a manner that could compromise the source or the collector. Debriefing and elicitation are still the primary collection techniques. Teams are frequently deployed to conduct collection at roadblocks, refugee collection points, and detainee collection points. They may conduct interrogations of EPWs and other detainees within the limits of the mission-specific orders, and applicable law and policy. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs. DOCEX is also used to accomplish exploitation of threat documents. Reporting is normally via SALUTE report and IIR.

HUMINT COLLECTION IN A HOSTILE ENVIRONMENT

3-21. In a hostile environment, the three concerns for HUMINT collection are access to the sources of information, timeliness of reporting, and security for the HUMINT collectors. Prior to the entry of a force into a hostile AO, HUMINT collectors are used to debrief civilians, particularly refugees, and to interrogate EPWs and other detainees who have been in the AO. HCTs are normally located with the friendly units on the peripheries of the AO to facilitate timely collection and reporting. If a refugee or EPW/detainee population exists prior to this mission, they are screened to determine knowledgability of the AO and are debriefed or interrogated as appropriate. HUMINT collectors accompany the friendly ground reconnaissance elements as they enter the AO. As part of the ground reconnaissance force, they interrogate EPWs and other detainees and debrief refugees, displaced persons, and friendly force patrols. Reporting is normally via oral or written SALUTE reports with more detailed information reported via IIRs. They may also support the S2 through the systematic debriefing of friendly ground reconnaissance assets and the translation of any documents collected by them.

EAC HUMINT

MI BRIGADES AND MI GROUPS SUPPORTING COMPONENT COMMANDS

3-22. Each SCC with an outside continental United States (OCONUS) responsibility has an US Army Intelligence and Security Command (INSCOM) MI brigade or group to provide operational HUMINT support to that command. These MI elements provide peacetime support to the unified

command and add a consistent, forward-deployed presence in a particular theater of operations. Theater MI brigade and group assets provide HUMINT support during contingency operations. These HCTs can support a JTF, an army combatant command, or any deployed element that requires augmentation.

JOINT, COMBINED, AND DOD HUMINT ORGANIZATIONS

3-23. The Departments of the Air Force and the Navy have limited HUMINT collection capability. They will normally provide strategic debriefing trained and certified personnel to joint interrogation and debriefing facilities primarily to collect information on areas of particular interest to that Military Department. Within the Department of the Navy, however, the US Marine Corps has a robust tactical HUMINT collection capability that operates primarily in support of engaged Marine Corps forces. Marine expeditionary elements deploy with human exploitation teams (HETs) that provide organic HUMINT and CI support to the deployed Marine force. Marine HETs are rapidly deployable and fully equipped to conduct the full range of tactical HUMINT and CI functions. They can provide support to either the deployed Marine force or as part of JTF HUMINT or CI teams. Each Marine Expeditionary Force (MEF) has organic HETs. HETs can also be attached to a Marine Air-Ground Task Force (MAGTF) for a particular operation.

SUPPORT AGENCIES

3-24. HUMINT agencies from DOD, national level intelligence agencies, and LEAs can support the battlefield commander. In a JTF, a national intelligence support team (NIST) works with the J2X to coordinate national level activities with JTF and component HUMINT and analytical assets. Sometimes liaison officers (LNOs) are assigned directly to the C/J/2X to facilitate collection activities.

- **Defense Intelligence Agency (DIA).** The DIA is a DOD combat support (CS) agency and an important member of the United States Intelligence Community. With more than 7,000 military and civilian employees worldwide, DIA is a major producer and manager of foreign military intelligence. DIA provides military intelligence to warfighters, defense policymakers and force planners in DOD and the Intelligence Community in support of US military planning and operations and weapon systems acquisition.
  - **Defense HUMINT (DH) Service.** The DH Service, a branch of the DIA, is the force provider for strategic HUMINT forces and capabilities. During operations, elements from DH form a partnership within the supported JTF headquarters J2X element for the coordination and deconfliction of HUMINT source-related collection activities. DH support to a joint force is outlined in the classified DIAM 58-11 and DIAM 58-12.
- **Central Intelligence Agency (CIA).** The CIA supports US national security policy by providing accurate, evidence-based, comprehensive, and timely foreign intelligence related to national security. The CIA

conducts CI activities, HUMINT collection, special activities, and other functions related to foreign intelligence and national security as directed by the President. Joint Pub 2-01.2 (S//NF) contains details of CIA contributions to the deployed force.

- **Department of State.** The State Department's Bureau of Diplomatic Security provides CI support to diplomatic missions worldwide and gathers extensive information on intelligence capabilities of adversaries within that diplomatic mission's area of concern. The Bureau of Intelligence and Research is the State Department's primary source for interpretive analysis of global developments. It is also the focal point in the State Department for all policy issues and activities involving the Intelligence Community.
- **National Security Agency (NSA).** The NSA is a DOD agency that coordinates, directs, and performs highly specialized activities to protect US information systems and produce foreign intelligence information. It is also one of the most important centers of foreign language analysis and research within the Government.
- **Defense Criminal Investigative Service (DCIS).** The DCIS is the criminal investigative arm of the Inspector General (IG) of DOD. The DCIS's mission is to protect America's warfighters by initiating, conducting, and supervising investigations in support of crucial National Defense priorities.
- **Department of Justice**:
  - Federal Bureau of Investigation. The FBI may provide the deployed commander with national level expertise on criminal and CI issues if currently operating in a task force (TF) AO and liaison is established early.
  - Drug Enforcement Agency (DEA). The DEA provides counterdrug operational expertise to a deployed TF and coordinates its operations with those of a deployed TF.
- **Department of Homeland Security (DHS).** The DHS mission is to prevent terrorist attacks within the United States, reduce the vulnerability of the United States to terrorism, protect the homeland, its citizens, and critical infrastructure and key resources against terrorist attack. DHS provides a lead for Federal incident response, management, and recovery in the event of terrorist attack and natural disasters. The Secretary of Homeland Security is the principal Federal official for domestic incident management. Pursuant to the Homeland Security Act of 2002, the Secretary is responsible for coordinating Federal operations within the United States to prepare for, respond to, and recover from terrorist attacks, major disasters, and other emergencies. DHS operates the Homeland Security Operations Center (HSOC) and the DHS-led Interagency Incident Management Group (IIMG). The DHS AOR is the US and its territories. DHS secures and protects the entry points to the nation, the areas between the entry points, land and water, for people, and cargo or conveyances. DHS enforces immigration, customs, and transportation security laws and

regulations, counter-narcotics, counterfeiting, financial crimes, and threats to the President. As legislated in the Homeland Security Act of 2002, DHS is chartered as the primary outreach Federal activity for state, local, and tribal governments, and the private sector. Although DHS has no direct role in support of a "battlefield commander" outside the United States, DHS component organizations have representatives deployed in support of US Government missions in the US Central Command (USCENTCOM) AOR.

- **Department of Energy (DOE).** The DOE can assist with the—
  - Exploitation of weapons of mass destruction (WMD).
  - Protection or elimination of weapons and weapons-useable (dual-use) nuclear material or infrastructure.
  - Redirection of excess foreign weapons expertise to civilian enterprises.
  - Prevention and reversal of the proliferation of WMD.
  - Reduction of the risk of accidents in nuclear fuel cycle facilities worldwide.
  - The capability enhancement of WMD detection including nuclear, biological, and chemical (NBC).
- **National Geospatial Intelligence Agency (NGA).** The NGA is a member of the US Intelligence Community and a DOD Combat Support Agency. NGA provides timely, relevant, and accurate geospatial intelligence in support of national security objectives. Geospatial intelligence is the exploitation and analysis of imagery and geospatial information to describe, assess, and visually depict physical features and geographically referenced activities on the Earth.
- **Counterintelligence Field Agency (CIFA).** The mission of CIFA is to develop and manage DOD CI programs and functions that support the protection of the Department. These programs and functions include CI support to protect DOD personnel, resources, critical information, research and development programs, technology, critical infrastructure, economic security, and US interests against foreign influence and manipulation, as well as to detect and neutralize espionage against the Department.

3-25. Most potential coalition partners have some type of HUMINT capability. Less developed nations may use HUMINT as their primary collection system and may be quite skilled in HUMINT operations. These assets will be present on the battlefield, and US assets are likely to work with them. HCTs should perform regular liaison with coalition HUMINT personnel. It is likely that some coalition partners will be more knowledgeable of the culture in the AO and be able to share insights with US HCTs.

Chapter 4

HUMINT Operations Planning and Management

4-1. HUMINT operations planning and management are supported by a robust structure that includes staff elements such as the C2X when working with non-US forces at the Joint intelligence staff level, G2X at the Division, Corps intelligence staff, the HUMINT operations section in the MI Battalion, and HAT in the Division and Corps ACE. It also includes C2 elements at the MI battalion, company, platoon, and team levels. The OMT provides the first level of staff and C2 functions when two or more HCTs deploy in support of an operation. (See Table 4-1.)

Table 4-1. HUMINT Operations.

ECHELON	ISR PLANNING	TECHNICAL SUPPORT AND DECONFLICTION	MISSION EXECUTION
COMBINED	C2/ACE	C2X/OMT	MI CDR
JOINT	J2/ACE	J2X/OMT	MI CDR (AMIB or MI Battalion)
CORPS/DIVISION	G2/ACE	G2X/OMT	MI CDR/OMT
BRIGADE	S2	MI CDR/OMT	MI CDR/OMT

HUMINT AND THE OPERATIONS PROCESS

4-2. Following the operations process defined in FM 3-0, Chapter 6, there are four components within HUMINT operations: Plan, Prepare, Execute, and Assess.

PLAN

4-3. HUMINT planning defines collection objectives, when to collect it, and which resources will be tasked to do the collection. Commanders with HUMINT collection assets in their units receive collection tasking based on requirements developed during ISR planning. The commander and staff, in concert with their supporting OMTs, assess the requirements and task the team or teams best capable of answering the requirement based on contact placement and access.

4-4. Another aspect to consider carefully during the Plan phase of the operational cycle is technical control. Technical control is ensuring adherence to existing policies and regulations, providing information and guidance of a technical nature, and supervising the MOS-specific TTP required in

conducting collection missions. Planning must take into account that technical control does not interfere with or supersede any C2 that a commander has over an asset or unit nor does it interfere with collection of the commander's requirements. For HUMINT collectors, the technical control network includes the C/J/G/S2X, the HOC, and OMTs. Technical control includes the management of source and other sensitive data and databases, the management of intelligence contingency and incentive funds, the liaison with other HUMINT organizations, and the deconfliction of operations. Technical control provides HCTs with specific requirements and data that they need to conduct operations and, in certain circumstances, specific instructions on how to execute missions.

PREPARE

4-5. During this phase, commanders and staff, including HUMINT management sections, review HUMINT mission plans. This review is to ensure all areas of the mission are considered and addressed in the plan and included in rehearsals. Items to cover include but are not limited to—

- Route (primary and alternate).
- Communications.
- Security plan.
- Convoy procedures including actions on contact and rally points.
- Initial requirements to be covered.
- Mission duration.

4-6. The HUMINT collector then researches the topic area addressing the requirement and prepares a questioning plan. The HCTs and OMTs must coordinate all mission requirements. It is important that HUMINT elements are included in all rehearsals conducted by their supported unit. These rehearsals will enable HCTs to carry out essential coordination with other units and ensure that they are included in and familiar with procedures such as resupply, communications, casualty evacuation, fire support, and fratricide avoidance. Rehearsals and briefbacks will allow the supported command to see and correct problems with their support to the HUMINT elements prior to deployment.

EXECUTE

4-7. Mission execution consists of the collection of information in accordance with the integrated ISR plan. The requirements manager validates the requirements based on command guidance. The G3 tasks the requirements to the units and the individual asset managers (that is, OMT) to identify the assets best capable to answer the requirement. When requirements are levied against a specific HCT, the HCT leader decides which of his team's contacts can best answer the requirements. He then turns the requirement into specific team tasks.

ASSESS

4-8. Assessment is the continuous monitoring—throughout planning, preparation, and execution—of the current situation and progress of an

operation, and the evaluation of it against criteria of success to make decisions and adjustments. Assessment plays an integral role in all aspects of the intelligence process (see FM 2-0).

HUMINT COMMAND AND CONTROL

4-9. Commanders of organizations that conduct HUMINT operations are responsible for task organization, mission tasking, execution, mission accomplishment, and designation of subordinate AOs (within the guidelines of the OPORD or OPLAN**).** MI unit commanders who exercise direct control of HUMINT operations, including interrogation operations, at all levels are responsible for and stand accountable to ensure HUMINT collection activities comply with this manual and applicable law and policy. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs. The MI unit commanders must ensure mission accomplishment by properly allocating resources and logistics in support of all HUMINT collection assets assigned to their units. Commanders must ensure that their HUMINT collection personnel are trained and ready for the mission. There is a need for a partnership between the J/G2X, who exercises technical direction and oversight responsibility and the MI commander, who exercises direct command authority and responsibility. The MI unit commander analyzes the higher headquarters mission, concept of operations, and the specified and implied tasks given to his unit. He restates the unit mission, designs the concept of operations, task organizes his assets, and provides support to subordinate units. Specifically, the MI unit commander—

- Issues mission orders with sufficient details and time for subordinate commanders and leaders to plan and lead their units.
- Must know the threat, his organization, ISR systems, counter-ISR systems, operations, and terrain over which his units will operate and how that terrain enhances or limits HUMINT collection operations.
- Must be aware of the operational and technical limitations of his unit and ensures that all assets are task organized, properly positioned, and fully synchronized to accomplish the mission.
- Oversees the collective and individual training within his unit.
- Coordinates continuously with the higher headquarters staff, the supported maneuver unit staff, and other commanders to ensure integrated R&S operations and support.
- Establishes clear, consistent standards and guidance for current and future operations in order to adhere to policy and the higher headquarters commander's intent without his constant personal supervision.
- Continually assesses his unit's ability to sustain its internal operations and its ability to support assigned missions and keeps the higher headquarters staff informed of unit, equipment, and personnel status that affect collection operations.

- Advises his higher headquarters commander and staff on the capabilities, limitations, and most effective employment of his assets.
- Remains flexible during operations to adjust or execute missions upon receipt of new orders and when the situation changes.
- Ensures personnel are working within legal, regulatory, and policy guidelines.

TECHNICAL CONTROL

4-10. Technical control refers to supervision of the TTP of HUMINT collection. Technical control ensures adherence to existing policies or regulations and provides technical guidance for HUMINT operations. The elements that provide technical control also assist teams in translating collection requirements into executable tasks. Commanders rely on the expertise of intelligence personnel organic to their unit and within higher echelons to plan, execute, and assess the HUMINT collection effort. The OMTs, HATs, and the HOC of the C/J/G/S2X provide technical control. They—

- Define and manage operational coverage and direction.
- Identify critical collection criteria such as indicators associated with targeting.
- Prioritize collection missions in accordance with collection requirements.
- Advise teams on collection techniques and procedures in accordance with policy, regulations, and law.
- Register and deconflict sources.
- Conduct operational reviews.
- Advise commanders.
- Conduct operational coordination with staff elements and other intelligence agencies.
- Manage ICF and incentive usage.

COMMAND AND SUPPORT RELATIONSHIPS

4-11. The activities of HUMINT assets are governed by their command or support relationship. There are subtle differences in the Joint versus the Army description of some of the command and support relationships. Tables 4-2 through 4-4 show these relationships.

4-12. During interrogation operations, close coordination must occur between intelligence personnel and personnel responsible for detainee operations including MP security forces, Master at Arms, and other individuals providing security for detainees. The facility commander is responsible for all actions involving the humane treatment, custody, evacuation, and administration of detainees, and force protection. Whereas, the intelligence commander is responsible for the conduct of interrogation operations.

COMMAND AND SUPPORT RELATIONSHIPS FOR HUMINT OPERATIONS

4-13. Clear command and support relationships are fundamental in organizing for all operations. These relationships identify responsibilities and authorities among subordinate and supporting units. The commander designates command and support relationships within his authority to weight the decisive operation and support his scheme of maneuver. Some forces available to a commander are given command or support relationships that limit his authority to prescribe additional relationships. Command and support relationships carry with them varying responsibilities to the subordinate unit by parent and gaining units. By knowing the inherent responsibilities, a commander may organize his forces to establish clear relationships.

4-14. Command relationships establish the degree of control and responsibility commanders have for forces operating under their tactical control (TACON). When commanders establish command relationships, they determine if the command relationship includes administrative control (ADCON). Table 4-2 shows Army command and support relationships and Table 4-3 shows joint command relationships chart from FM 3-0 (derived from JP 0-2 and JP 3-0).

4-15. Support relationships define the purpose, scope, and effect desired when one capability supports another. Support relationships establish specific responsibilities between supporting and supported units. Table 4-2 shows Army command and support relationships and Table 4-4 shows joint support relationships from FM 3-0 (derived from JP 0-2 and JP 3-0).

HUMINT REQUIREMENTS MANAGEMENT

4-16. The G2/S2 is responsible for RM. He uses the requirements management (RM) process to orchestrate the actions of the unit's organic and supporting ISR capabilities into a unified effort to gain situational understanding and answer the commander's PIRs. Through centralized planning and decentralized execution, RM optimizes the integration of ISR operations into the commander's scheme of maneuver and fire and into the unit's long- and short-range planning. Control mechanisms within the RM structure facilitate the identification of information shortfalls and the redirection of ISR assets to new intelligence production, reconnaissance, or surveillance missions.

Table 4-2. Army Command and Support Relationships.

IF RELATIONSHIP IS:		INHERENT RESPONSIBILITIES ARE:							
		Has Command Relationship with:	May Be Task Organized by:	Receives CSS from:	Assigned Position or AO By:	Provides Liaison To:	Establishes/ Maintains Communications with:	Has Priorities Established by:	Gaining Unit Can Impose Further Command or Support Relationship of:
COMMAND	**Attached**	Gaining unit	Gaining unit	Gaining unit	Gaining unit	As required by gaining unit	Unit to which attached	Gaining unit	Attached; OPCON; TACON; GS; GSR; R; DS
	OPCON	Gaining unit	Parent unit and gaining unit; gaining unit may pass OPCON to lower HQ. Note 1	Parent unit	Gaining unit	As required by gaining unit	As required by gaining unit and parent unit	Gaining unit	OPCON; TACON; GS; GSR; R; DS
	TACON	Gaining unit	Parent unit	Parent unit	Gaining unit	As required by gaining unit	As required by gaining unit and parent unit	Gaining unit	GS; GSR; R; DS
	Assigned	Parent unit	Parent unit	Parent unit	Gaining unit	As required by parent unit	As required by parent unit	Parent unit	Not Applicable
SUPPORT	**Direct Support (DS)**	Parent unit	Parent unit	Parent unit	Supported unit	Supported unit	Parent unit; Supported unit	Supported unit	Note 2

	General Support Reinforcing (GSR)	Parent unit	Parent unit	Parent unit	Parent unit	Reinforced unit and as required by parent unit	Reinforced unit and as required by parent unit	Parent unit; then reinforced unit	Not Applicable
	General Support (GS)	Parent unit	Parent unit	Parent unit	Parent unit	As required by parent unit	As required by parent unit	Parent unit	Not Applicable

NOTE 1. In NATO, the gaining unit may not task organize a multinational unit (see TACON).

NOTE 2. Commanders of units in DS may further assign support relationships between their subordinate units and elements of the supported unit after coordination with the supported commander.

Table 4-3. Joint Command Relationships and Inherent Responsibilities.

(from FM 3-0, derived from JP 0-2 and JP 3-0)

Inherent Responsibilities Are:	If relationship is:		
	COCOM	OPCON	TACON
Has command Relationship with:	Gaining combatant commander; gaining service component commander	Gaining Command	Gaining Command
May be task organized by:	Gaining combatant commander; gaining service component commander	Gaining Command	Parent Unit
Receives logistic support from:	Gaining service component commander	Service component command; parent unit	Parent Unit
Assigned position or AO by:	Gaining component commander	Gaining Command	Gaining Command
Provides liaison to:	As required by gaining component commander	As required by gaining command	As required by gaining command
Establishes and maintains communications with:	As required by gaining component commander	As required by gaining command	As required by gaining command and parent units
Has priorities established by:	Gaining component commander	Gaining Command	Gaining Command
Gaining unit can impose further command relationship/authority of:	OPCON; TACON; direct support; mutual support ; general support; close support	OPCON; TACON; direct support; mutual support; general support; close support	Direct support; mutual support; general support; close support

Table 4-4. Joint Support Categories.

(from FM 3-0, derived from JP 0-2 and JP 3-0)

CATEGORY	DEFINITION
General Support	The action given to the supported force as a whole rather than to a particular subdivision thereof.
Mutual Support	The action that units render each other against an enemy because of their assigned tasks, their position relative to each other and to the enemy, and their inherent capabilities.
Direct Support	A mission requiring a force to support another specific force and authorizing it to answer directly the supported force's request for assistance.
Close Support	The action of the supporting force against targets or objectives that are sufficiently near the supported force as to require detailed integration or coordination of the supporting action with fire, movement, or other actions of the supported force.

DEVELOP HUMINT REQUIREMENTS

4-17. The first step in the RM process is to develop intelligence requirements that accurately identify and prioritize the commander's concerns about the threat and the battlefield environment that must be resolved to accomplish the mission. The G2/S2X, or his representative, normally supports the G2/S2 by identifying HUMINT collection requirements and opportunities and advises the command and staff on HUMINT capabilities. The HUMINT representative must be able to discuss any delays or risks involved in using HUMINT assets. Through participation in the requirements development process, the HUMINT representative has a thorough understanding of the commander's intent and concept of operations and is better able to support the overall ISR effort.

4-18. The analysis of HUMINT requirements is normally a coordinated effort between the HUMINT and CI staff officer (C/J/G/S2X) and the HAT of the supporting analysis element. The C/J/G/S2X team—

- Records all HUMINT requirements whether generated internally (Specific Orders) or received from other echelons or units (Requests).
- Tracks each requirement from receipt to final satisfaction.
- Reviews each requirement for its—
  - **Feasibility.** Feasibility is a determination if a requirement can be answered given available time and resources.
  - **Completeness.** Does the requirement contain all the specifics needed for collection, such as: What the collection requirement is? When the latest time information is of value (LTIOV)? Why it needs to be collected? Who needs the results of the collection?
  - **Necessity.** The C/J/G/S2X team, with the assistance of the HAT, checks available intelligence databases to determine if the required

information has already been collected or is included in an intelligence product.

4-19. The RM team, with the assistance of the C/J/G/S2X team and the HAT, breaks the HUMINT-related PIR into SIRs. Each SIR describes the indicator of threat activity linked to an area or specific location and time. The HOC evaluates—

- Reportable criteria that are linked to the threat activity. The HOC associates these characteristics with a SIR, and compares the characteristics to a particular HUMINT asset's capability to collect.
- Range, which is the distance from the current location of the HUMINT asset or resource to the source. In other words, are there sources available that had or have access to relevant information on the area or activity in question, and can the HUMINT team contact them in a timely manner?
- Timeliness, which is when the information must reach the commander to be of value; that is, the LTIOV.

4-20. The RM team, supported by the C/J/G/S2X and the HAT, attempts to answer the SIRs with intelligence products developed from information available within the existing intelligence databases or pulled from other organizations within the intelligence architecture. If the requirement can be answered in this manner, the intelligence is immediately disseminated. When the required information is neither available nor extractable from archived information or from lower, lateral, or higher echelons, the C/J/G/S2X team develops it into an RFI to higher or an ISR tasking for organic or attached HUMINT assets. The compilation of unanswered requirements and how to answer them form the basis of the ISR plan. The tasking may be in the form of an SDR. An SDR is a specific request or tasking for a collector to question a source on a particular collection requirement. This request involves analysis that results in the conclusion that a specific source possibly has the placement and access to answer a SIR. SDRs are specific; whereas, HUMINT collection requirements (HCRs) are general.

DEVELOP THE HUMINT PORTION OF THE INTEGRATED ISR PLAN

4-21. The HOC within the C/J/G/S2X section assists the G3/G2 in developing the HUMINT portion of the ISR plan in coordination with the HAT and the RM team. The HOC ensures that the HUMINT capabilities and taskings are included in the plan although the plan often will not contain the specifics of HUMINT operations due to the sensitivity of the sources and techniques. The HOC will coordinate with the Office of the SJA to ensure the HUMINT portion of the integrated ISR plan complies with applicable law and policy prior to its implementation. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs. The HOC coordinates with C/J/G/S2X for mission deconfliction at that echelon to specify the collection capability and current

status of the various HUMINT organizations to better enable him to select the "best" organization to collect on various SIRs. HUMINT collection generally requires time to develop the environment and access sources.

4-22. The HUMINT collection environment during an SSC is different from an MTW. During an MTW where the force is moving, a division normally plans 48 hours out; a corps plans 72 hours out. In contrast, the planning focus for units supporting an SSC may be 3 to 6 months out. The longer HCTs are in an area, the better the collector is able to develop leads to answer collection requirements. Requirements may be continuous or may be concerned with specific upcoming events such as national elections. HUMINT is a key asset to determine adversary intentions; however, it is highly dependent on the ability to cultivate or locate sources with the desired information. HUMINT in support of stability and reconstruction operations is not a short-term undertaking. [Example: National level elections are taking place in the AO in 3 months. As a part of integrated ISR planning, an assessment must be conducted to determine the capability to answer post-election collection requirements based upon current contacts and HUMINT leads. If there are no leads or contacts that could answer election-related collection requirements, it is necessary to spot, assess, and contact sources to meet requirements.]

4-23. A second part of the HUMINT portion of the integrated ISR plan is the HUMINT collection focus, which—

- Designates which collection requirements comprise the emphasis for collectors' missions.
- Prioritizes collection requirements based upon the operational environment in the AO and future missions in the AO.
- Includes future operational collection tasks which aid in causing a gap or pause in collection as the unit transitions to the next operational phase or the next operation.

4-24. In addition to specific requirements, a statement of intelligence interest (SII) at the joint level or a collection emphasis message at division or corps is issued to identify the overall collection goals for a time period. As the collection request or requirement is passed down, each echelon performs additional planning for its own specific requirements.

Evaluate HUMINT Resources

4-25. After identifying the SIRs, the HOC and the C/J/G/S2X determine the availability and capability of HUMINT assets and resources that might contribute to requirement satisfaction and which are most suited to collect against each SIR. This does not necessarily imply that the C/J/G/S2X assigns a tasking to a specific team; rather, it develops the requirements or requests for an organization that then executes the mission. The HOC and C/J/G/S2X should also consult the HAT for its analysis of additional potential HUMINT assets and resources which might be available, both on and off the battlefield, to contribute to requirement satisfaction. For example, the HAT may be aware of a group of émigrés now living elsewhere who previously lived near a target site, and who might be able to provide answers to collection requirements if debriefed.

Determine Asset or Resource Capabilities

4-26. The HOC translates the capabilities and limitations of the available HUMINT assets into a set of factors that they can compare to the SIR characteristics. Asset capability factors are technical or performance characteristics, location, and source access. Each HUMINT asset is evaluated for its—

- **Availability.** The HOC reviews the list of viable HUMINT assets for current availability and the addition or deletion of capabilities. This includes considerations such as maintenance time and previous taskings. Coordination with adjacent and higher headquarters and national level agencies by the C/J/G/S2X will determine the availability of higher echelon resources.
- **Survivability**. Survivability must be commensurate with the threats to which the HUMINT assets will be exposed during the course of operations. These assets must be as survivable as, or in certain circumstances more survivable than, the forces they support. The HOC and the commander must weigh the risk versus the gain in using HUMINT assets.
- **Reliability.** Reliability is the ability of the asset to overcome threat deception measures such as misinformation or false information. In HUMINT there are two areas of reliability: source and collector. Source reliability is the determination on the part of the collector if the source is providing accurate information. Collector reliability is a determination on the part of the HOC that the HUMINT collectors within a particular organization have the level of training and experience to collect against a given requirement.
- **Suitability**. Tasking must be based on an asset's capability and on its suitability within the context of the overall plan. For example, HUMINT assets may be capable of collecting against a single target but have unique capabilities against a second target. Intelligence requirements may necessitate tasking these HUMINT assets against the second target if other assets can maintain adequate coverage of the first target.
- **Connectivity.** Connectivity is a critical aspect of any R&S operation. Interoperability, reliability, and robustness of sensors, communications, and supporting automated data processing (ADP) are crucial to the responsiveness, survivability, and overall combat effectiveness of a HUMINT asset. If the automation and communications systems of a HUMINT asset are dissimilar to those of other units in the AO, or if connectivity among assets, supporting systems, and supported systems and elements is too fragile to withstand the stress of operations, commanders will be deprived of important information essential to conducting tactical operations. The HUMINT asset must be able to transmit accurate and timely information to those who must receive it when they need it. Report formats should adhere to established standards in order to ensure that information is easily retrieval at the user desktop through automated queries (push/pull). Planners must look carefully at systems compatibility and the degree of interoperability among the components

of the communications architecture. The better the interoperability of assets and the more robust and redundant the communications links, the better the cross-cueing and analytical exchange.

Develop the Scheme of Support

4-27. The scheme of support is the orchestration of HUMINT assets, resources, and requirements to facilitate the collection of information most effectively. It includes all assets that the G3/S3 can task (organic, attached, and DS) and the G2 can request (from higher or adjacent units). By reviewing available HUMINT assets and higher echelon resources, the HOC and the G/S2X determine whether unit assets or higher echelon resources are best able to answer the requirements. If another echelon can answer an SIR, then the J/G/S2, normally through the C/J/G/S2X, requests them to collect the information and deliver the intelligence product. When planning the HUMINT portion of the ISR plan, the HOC should consider the following:

- **Cueing** is using one asset to tip off another to a possible target. The HOC should look for opportunities for HUMINT assets to cue other collection assets and vice versa.
- **Asset redundancy** uses a combination of the same type of assets against a high-priority collection target. This is vital in HUMINT collection since, in dealing with human sources, the information collected is often part of the overall picture or is influenced by the perception and prejudice of the source. The collection on the same target from a number of different assets gives a more accurate intelligence picture and is a method to validate source reporting.
- **Asset mix** uses a combination of different types of assets against a high-priority collection target. When the probability of success of one asset to satisfy the requirement completely is lower than acceptable, the use of multiple capabilities of different assets increases the likelihood of success; for example, using SIGINT assets to intercept voice communications while HUMINT assets observe activities. Neither can collect all the available information, but the information collected by both can be fused into a more complete picture. Like asset redundancy, asset mix places greater demands on the limited assets available, both collection and analysis, and has to be clearly justified by the potential intelligence gain.
- **Integration of new requirements** into ongoing missions may make it possible to reduce timelines, make collection more responsive to the request, and decrease cost and risk. This is critical in HUMINT due to the long time that it takes to develop sources. The use of an existing source to answer new requirements often facilitates collection.

Develop and Prioritize Taskings and Requests for Information

4-28. After the G2/S2X and the G2/S2 approve the HUMINT portion of the ISR plan, the HOC develops specific orders to task assets, develop additional assets, and/or requests to seek higher and lateral support and production. Specific taskings or RFIs are tailored to that specific ISR asset's capabilities and limitations. The G2/S2X supports the requirements manager and the G2/S2 in developing and prioritizing HUMINT taskings. The HOC works

with the unit requirements manager to incorporate the HUMINT plan into the overall unit ISR plan and works with the G3/S3 as necessary to help develop OPORDs or FRAGOs to organic or attached ISR units. HUMINT taskings will often include technical data that cannot be passed through normal tasking channels. The HOC will pass that information directly to the applicable HUMINT OMT or unit operations section.

4-29. The HOC and G2/S2X cannot provide operational taskings to a unit for collection. Collection is a stated mission that the commander executes. However, the technical control the HOC can provide as the HUMINT manager affords the J2/G2X the ability to steer and direct collection assets and operations. The MI commander and OMT determine specifically which teams will collect on a given requirement and are responsible for the TTP used. They report on the status and availability of their collection assets. On the HCT level, the team chief determines which sources will be contacted and the details of how the information will be collected from a given source. A specific plan is developed for each source. This plan should—

- Identify the requirement.
- Identify the proposed source.
- Identify questions to be asked during the source meeting.
- Contain an outline of how the meeting should proceed.
- Identify which collector will conduct the source meeting.

4-30. At the HCT level, the senior team member reviews each plan to ensure the proper planning for the collection mission. The plan is a minimum goal for the collection. The collector must be fully aware of the overall collection priorities and be prepared to take advantage of any additional leads.

DIRECT PRODUCTION

4-31. The G2 coordinates intelligence production to provide non-duplicative all-source intelligence products to the commander, staff, and subordinate forces. Some type of production occurs in the intelligence staff or separate analysis element at every echelon from national to battalion level. The HCT of the ACE at echelon's division and higher will support the intelligence production process through the analysis of HUMINT information and the development of single-discipline HUMINT products.

DISSEMINATE INFORMATION

4-32. The 2X element at each level is normally the release authority for HUMINT reporting and products, ensuring that reporting, products, and data are disseminated to the lowest appropriate level. The G/S2X should preplan criteria for the immediate release of combat information on high-value targets, impending attacks, or other time-sensitive requirements. This preplanning will ensure that commanders and other users quickly receive the information in a format that supports situational understanding, strategic responsiveness, and ISR and provides support to effects. Special effort is also made to ensure that information obtained from detainees is passed back down to the unit that detained them. This measure will support the efforts of the commander as well as building trust in the intelligence process.

EVALUATE REPORTING

4-33. The HAT and the HOC provide the requirements manager and the G2/S2 with expertise to support report evaluation. An important part of the evaluation process is providing feedback to the collectors. Feedback is important in HUMINT operations since the same source may be contacted again for additional information. The collector needs feedback on the accuracy, reliability, and appropriateness of the information reported. The G/S2X team tracks reporting to determine how well the HUMINT collection and production efforts are satisfying the PIRs. The G/S2X team supports the RM team's requirements to—

- **Monitor and Maintain Synchronization.** Through coordination with the G2/S2, the G/S2X, and the HAT, the HOC knows when and what critical pieces of information are missing from the commander's estimate of the situation. The HOC uses the HUMINT portion of the ISR plan to ensure synchronization with the overall operation and scheme of maneuver. The other critical tool for the HOC is the decision support template (DST). The HOC must have a complete copy of this document, ensuring the HUMINT assets do not miss a collection requirement.
- **Correlate Reports to Requirements.** The HOC tracks which specific order or group of specific orders originates from which PIR to ensure that the collected information was provided to the original requester. This also allows the HOC to rapidly determine which asset is available for retasking.
- **Screen Reports.** Each report received is screened for accuracy, timeliness, and applicability to the original tasking or request. If the HOC determines that it completely fulfills the tasking or request, the HOC informs the G/S2X and G2/S2 so that the tasking or request can be closed and the information provided to the original requesting unit.
- **Provide Feedback to Collectors and Analysts.** The HOC provides feedback to all the HUMINT R&S assets. This is normally provided through the C2 element of that unit. By doing so, the HOC quickly reinforces if the reporting is answering the original order or request, or the HOC can provide guidance if it is not. This feedback is essential. The RM team may provide additional information on its collection or analysis if the HOC tells the team exactly what is needed or has been missed in the original report.

UPDATE ISR PLAN

4-34. This step aids the G2/G3 in updating the ISR plan by eliminating satisfied collection requirements, redirecting assets to cover non-satisfied requirements, cross-cueing requirements, and adding new collection requirements to the ISR. This process is accomplished by adjusting the HUMINT portion of the overall integrated ISR plan. It maintains intelligence synchronization and optimizes the exploitation of information in response to situation changes in the AO. The updated HUMINT plan is distributed to the G/S2X requirements manager to ensure its incorporation into the overall unit ISR plan. Continuously updating the HUMINT portion of the ISR plan is vital due to the time involved in redirecting HUMINT assets.

HUMINT MISSION PLANNING

4-35. HUMINT mission planning begins when a unit receives a tasking to conduct HUMINT collection in support of a specific mission, operation, or collection plan. The mission analysis portion of the MDMP is explained in FM 5-0. Special factors must be considered when applying the MDMP to HUMINT operations as discussed below.

RECEIVE AND ANALYZE THE HIGHER HEADQUARTERS ORDER

4-36. Attention must be paid to the support relationship (GS or DS) that exists between HUMINT assets and the unit. The operational environment, including applicable law and policy under which the units are operating must be understood, as this affects the ability of the units to perform certain missions. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs. Because of frequently overlapping AOIRs in HUMINT operations, other unit missions and potential areas of conflict must be identified. Missions of other non-HUMINT units must be understood for coordination and possible integration of HUMINT assets. The availability of assets from higher echelons, requirements to provide support to lower echelons, and the existence of technical control from higher echelons must be identified. Tasking, reporting, and communications channels must be clearly understood.

ISSUE A WARNING ORDER

4-37. After the commander has analyzed his orders and worked out the mission and related tasks, he must quickly pass on this information to his team. This is accomplished through the WARNO. As a minimum, the WARNO must include to whom the order applies, time and nature of the operation, the earliest time of movement, and the time and place where the OPORD will be issued. Unit members should prepare for movement while the leader is performing the remaining preparatory tasks.

MAKE A TENTATIVE PLAN

4-38. When determining how the mission will be carried out, the commander works with the factors of METT-TC. When planning for HUMINT collection missions, focus must be placed on the human beings (threat, friendly, and neutral) as well as the key terrain on the battlefield, including information on—

- The demographics of both the AO and AOI.
- The organization and structure of all opposition in the AO and AOI.
- The history of the AO and AOI pertinent to the current situation.
- The economic and social data of all groups in the AO and AOI.

- All key leaders (political, military, social, religious, tribal), opinion leaders, and other influences on public opinion.
- The media and its influence on the population of both the AO and AOI.
- The primary and secondary languages and dialects spoken in all parts of the AO.

4-39. A target folder, if one is used, provides valuable up-to-date intelligence information about the AO for mission analysis and planning. Once intelligence products identify the contentious areas, trends, capabilities, and latest issues concerning the AO, the commander may request a target folder prepared on specific items, such as a hostile organization with the inclination and potential to cause harm to friendly forces. Target folders may include—

- Imagery of the AO and personalities.
- Terrain models of the AO.
- Latest information reports from the AO.
- Biographical data on key leaders in the AO.

Review Available Assets

4-40. The commander and staff, including the OMTs or HUMINT operations section, must look at organic assets and consider factors such as language capability, experience in various aspects of collection, analysis, and management. If organic assets are inadequate, the commander and staff should consider additional available assets within the organization and resources from higher echelons. The commander and staff must consider the analysis and management structure of a HUMINT operations section in addition to the OMT and HCTs. During this step the mission analysis and planning group should determine, among other things—

- The number of HUMINT collectors available.
- The number of collectors who are qualified linguists.
- The number of linguists available to support the collectors.
- Force protection considerations.
- The optimal number of HCTs, OMTs, and HUMINT operations sections that can be configured from the available assets.
- Whether additional assets such as CI agents, TECHINT personnel, analysts, additional linguists, or other experts need to be added to some or all the HCTs to meet mission requirements.

Determine Constraints

4-41. This is a critical step in HUMINT mission analysis. HUMINT collection operations are affected by applicable law and policy. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs. The degree of restriction may depend on the type of operation being conducted. Constraints are normally found in the scheme of maneuver, the concept of operations, and coordinating instructions. Specific to intelligence interrogation operations, in

accordance with DOD Directive 3115.09, "all captured or detained personnel shall be treated humanely, and all intelligence interrogations or debriefings to gain intelligence from captured or detained personnel shall be conducted humanely, in accordance with applicable law and policy. Acts of physical or mental torture are prohibited."

Identify Critical Facts and Assumptions

4-42. The human factor is preeminent in this step. Assumptions and facts include—

- How HUMINT collectors can interact with the local population.
- What types of sources are available.
- What types of adversary intelligence and unconventional threats are present.

Conduct Risk Assessment

4-43. There are inherent risks involved in HUMINT collection. HUMINT collectors need access to the local population to perform their mission. Rules that restrict all forces to base areas to protect the force may be prudent; however, these restrictions can severely degrade HUMINT collection capabilities, particularly in support of force protection requirements. This measure deprives the collectors of sources needed to anticipate and prevent violent incidents. HUMINT collectors receive cultural training as well as security training to allow them to minimize the dangers of interacting with the local population. Commanders must weigh the risk to collectors against the risk to the force as a whole, and determine whether to provide additional security to the HCT in order to allow the team to perform missions outside the base area to gain needed intelligence. DA Pam 385-1 provides guidance for risk assessment.

Select Courses of Action (COAs)

4-44. During COA development the staff, under the commander's guidance, analyzes various options for deploying and implementing HUMINT assets. Input from HUMINT senior NCOs and WOs is vital to COA development and analysis. Items to consider during COA development include—

- The distribution of the HCTs and OMTs within the AO.
- The support relationship (GS and DS) that exists for the deployed teams.
- The command relationship in effect for the HCTs and OMTs (assigned, attached, or OPCON).
- The manner in which the HUMINT assets are phased into the theater.
- The tactical configuration (personnel and equipment) of the HCT.
- The actual number of the HCTs and OMTs and the size of the supporting HUMINT operations section (if any) deployed.
- The priority of the OMT's efforts.
- The priority of linguist support.

COLLECTION PRIORITY

4-45. During the MDMP, the MI commander advises his higher headquarters on the most efficient use of the HUMINT collectors to meet collection requirements. Depending on the particular higher echelon mission and the capabilities of the specific personnel under his command, the supported S2 must decide whether to concentrate collection efforts on source, debriefing, interrogation, tactical questioning, liaison, or DOCEX operations to answer collection requirements. (See Chapter 5 for a description of these operations.) The MI commander may be required by his operational tasking to support any or all of these operations. He must decide how to task organize his assets to meet these requirements. When faced with limited assets, prioritization of collection is paramount.

4-46. A commander normally must prioritize HUMINT collections and DOCEX. Although the decision is primarily dependent on which type of source (human or document) is most likely to give the priority information, other factors such as phase of operation, ROE, source availability, and collection resource capabilities may influence his decision. At the tactical level, both human sources and documents are screened and the senior HUMINT soldier establishes the priorities. If documents and human sources are determined to be equally likely of containing priority information, human sources are normally exploited first due to—

- The ability of the HUMINT collector to get a human source to elaborate and explain his information, which cannot be done with a document.
- The rate at which people forget detailed information.
- The fact that an individual's resistance is easier to bypass immediately after undergoing a significant traumatic experience (capture). Capture thrusts them into an unfamiliar environment over which they have no control and are vulnerable to various approach techniques. This initial vulnerability passes quickly. An individual's established values begin to assert themselves again within a day or two, and the individual's willingness to cooperate might also decrease.

TASK ORGANIZATION

4-47. Because of the need to place HUMINT collectors in contact with the local population and the need in many cases to integrate the HUMINT collection process into other operations, the planning and analysis staff for HUMINT missions is somewhat expanded from the norm. They should include the C/J/G/S2X, SJA, S1, S2, S3, S4, S5, S6, other staff officers, as necessary, Provost Marshal, MP, and US Army Criminal Investigation Command, CA, unit HUMINT commanders, and senior HUMINT technicians of the deploying unit. If the unit's mission is to replace a currently deployed HUMINT unit, a representative of that unit should be included.

4-48. The challenge to the MI commander is the proper training during operations, task organization, placement, and coordination of movement of HUMINT elements to meet collection requirements. The unit modified table of organization and equipment (MTOE) organization, which is designed for an MTW, may have to be modified to meet the specific requirements of

operations in PMEs and SSCs. Augmentation is often needed and must be requested. Task organization must be flexible to adjust to the dynamic mission objectives. Commanders must allow for the augmentation of HCT with other MI specialties and non-MI personnel as mission analysis and planning indicate the need. Mission analysis and planning identify the specific requirements for the HUMINT operations section, HAT, OMTs, and HCTs.

4-49. The composition of the HUMINT elements must be based on METT-TC factors. The number of HCTs and OMTs in the theater depends on the intensity of the collection effort and the geographical coverage of the AO. HCT members should be prepared to support any HUMINT missions they may receive through command channels. They must have the skills to shift easily from one set of functions to another based on the dynamic mission requirements. The number of OMTs in a designated theater will depend on the type and nature of the mission. A single OMT is capable of managing and controlling 2 to 4 HCTs. The size and staffing of the OMT will depend on a number of factors:

- Whether a HUMINT operations section is deployed and how many HCTs are subordinate to it.
- If a single HCT deploys to support a small contingency, there may be no need for an OMT. In this case the team leader must serve as the OMT.
- If three or more OMTs deploy, then a tactical HUMINT operations section should be deployed.
- For every 3 to 4 HCTs and their designated OMT, there should be one headquarters element composed of a platoon leader and a platoon sergeant to handle all administrative and logistical matters.

OPERATIONAL CONSIDERATIONS

RESERVE COMPONENT INTEGRATION

4-50. Given the Army's OPTEMPO and force structure, the integration of RC forces into the AC is highly likely for future operational deployments. Commanders must identify their requirements early and establish proactive coordination (both in garrison and while deployed) with their RC counterparts to fully integrate them during all phases of training and operations. During operations that include significant RC participation, an RC liaison officer normally will be assigned, either temporarily or permanently (at higher echelons), at the appropriate level of command. The commander and staff must ensure that the RC LNO is involved in all aspects of operational planning and execution.

4-51. There are three general categories of RC augmentation:

- Category 1: Formation of specialized units that include a fully integrated AC and RC TOE. The activation of the RC of these units is required for their full operational capability.
- Category 2: Augmentation of active duty units by RC units to fill out unit strength levels or to provide additional functionality. For example, an AC division might require additional HUMINT teams to support it

during a stability operation. If a division required one additional team, it should request a team and not request four HUMINT collectors. If the requirement is for three additional teams, it should request a HUMINT platoon with its organic C2 and OMTs.

- Category 3: The requirement for individual augmentees. This usually occurs when a unit has the C2 structure but needs either additional personnel or additional capability within the command structure. For example, a unit may have a HUMINT platoon but the platoon is at 50 percent strength. Individual augmentation is the easiest method of integration since the individual is integrated in the same manner as any replacement. The augmented unit normally is required to provide all equipment other than initial issue-type equipment.

4-52. There are several items to consider in unit augmentation:

- Accurate Identification of Requirements: During the MDMP, units need to identify those mission-essential capabilities not already present in the unit. The G3/S3, working in conjunction with the G1/S1, considers options that may include RC augmentation of organic units although the final decision to employ RC units is usually determined at Headquarters, Department of Army (HQDA). The requirement for augmentation is forwarded through appropriate personnel channels to US Army Forces Command (FORSCOM) and HQDA, which will identify the appropriate units or personnel. If approved, they will work with the appropriate agencies to establish the timeline in which the units can respond on the Time-Phased Forces Deployment Data List (TPFDDL). When developing requirements, the requesting unit must be sure to articulate its needs accurately, specifying required skills, numbers, and any additional skill identifiers (ASI). [Example: Request augmentation by a HUMINT platoon consisting of at least a platoon headquarters, three HCTs, one OMT, two linguists, and one CI/HUMINT Automated Tool Set (CHATS) proficient operator. The augmenting element will be operating in support of the commander's force protection program in the gaining unit's AOR.]
- Activation Timeline: Units need time to mobilize and conduct any additional collective and individual training that may be specific to the unit's mission or operational environment. The requesting unit needs to be aware of the time required to activate the requested RC and that there may be differences in levels of training or equipment. Timelines should be established by FORSCOM to allow resolution of these problems and should be reflected in the commander's operational planning sequence. Timelines will vary from unit to unit and mission to mission.
- Training: USAR and ARNG units usually cannot train their units or individuals to the same proficiency as the AC. Normally, this is due to the limited amount of training time. Because of this limitation, a certain degree of train-up prior to deployment may be necessary. Commanders should identify available training opportunities and request the participation of personnel identified for augmentation. For an ongoing mission, you should also plan for an extended "right seat

ride" mission handover period once the individuals or unit arrives in the theater of operations.

- Command and Control: If the RC augmentation requires activation of an entire unit, it should include their C2 element. If the augmentation is by individuals, then they will fall under the command and control of the gaining units.
- Time on Active Status: USAR and ARNG soldiers are restricted as to the amount of time they can remain on active status. This timeline begins on the date of mobilization and ends on the day the soldier leaves active duty status. Deployed units must take this into account when conducting continuous operations and must identify the requirement to replace RC forces early enough to allow for the required training and handoff procedures.
- Experience: While RC personnel normally lack current military experience, they often perform jobs in the civilian sector that either mitigate this lack of experience or they are able to bring a new and useful capability with them. Care should be taken that reservists who have civilian jobs which are similar to their HUMINT MOS (such as police officers or investigators) recognize the different constraints under which they operate in the military environment. For example, police officers who might normally task informants with minimal oversight cannot do that in their position as a HUMINT collector. Commanders should try to capitalize on these skills, but ensure proper training and understanding of the policies and regulations that govern HUMINT collection operations.

OPERATIONS PLANS, OPERATIONS ORDERS, AND ANNEXES

4-53. An OPLAN is any plan for the conduct of military operations. When a commander issues a directive for the coordinated execution of a military operation, it becomes an OPORD. Although plans are based on specific conditions or assumptions, they are not static. Plans are changed, refined, and updated as a result of continuous estimates and studies. It is critical to include HUMINT plans in the Intelligence Annex to the OPLAN.

4-54. The OPORD gives the HUMINT element approval to execute its mission. OPORDs define the mission, set the parameters of operations, identify who is responsible for what, and how it is to be supported. Additions that are necessary to amplify an OPLAN or OPORD are contained in annexes, appendices, tabs, and enclosures. Tasking for units to conduct HUMINT collection operations is listed in the main body of the OPORD under **Tasks to Subordinate Units**. The HUMINT appendix to Annex B provides the technical guidance for HUMINT collection including the umbrella concept for HUMINT operations.

4-55. The HUMINT appendices provide details on planning, coordinating, approving, and managing HUMINT operations as they relate to the unit's overall mission. These appendices serve as the basic document authorizing most HUMINT operations and programs. They must be reviewed and approved by the appropriate office or commander. The HUMINT appendix to the ISR Annex is necessary to ensure that augmentation of HUMINT assets

from other components and agencies are integrated throughout the TF as required to facilitate their specialized collection requirements. Specific tabs may include joint debriefing and interrogation facility operations, source operations, DOCEX, or open-source information.

OPERATIONAL COORDINATION

4-56. HUMINT collection is not conducted in a vacuum. Coordination with MI organizations and non-MI agencies, units, and staff organizations is often critical to expedite and complete HUMINT collection operations. (See Appendix C for predeployment planning.)

MI ORGANIZATIONS

4-57. Elements involved in HUMINT planning, execution, and analysis need to maintain close coordination with their counterparts in the other intelligence disciplines. Coordination includes but is not limited to the disciplines shown below.

Imagery Intelligence:

- Support imagery analysis by using HUMINT sources to identify or confirm the identification of items in imagery. This includes, for example, using human sources to identify the functions of buildings that have been tentatively identified through external imagery.
- Coordinate for current military or civilian imagery to use in the questioning of sources.
- Cue requirements managers and others involved in imagery tasking on locations or activities for imagery collection.
- Coordinate for IMINT information to verify information obtained through HUMINT collection.
- Provide imagery for analysis (through still and video photography and captured imagery).
- Coordinate for technical support as required when questioning personnel on subjects related to imagery.
- Obtain imagery-related collection requirements that can be answered by human sources.

Signals Intelligence:

- Support signals analysis by using HUMINT sources to identify or confirm the information obtained through SIGINT collection.
- Coordinate for current SIGINT information to use in the questioning of sources.
- Cue requirements managers and others involved in SIGINT tasking on locations or activities (including communications types and frequencies) for SIGINT collection.
- Coordinate for information to verify information obtained through HUMINT collection.
- Provide SIGINT-related CEDs for SIGINT analysis.

- Coordinate for technical support as required when questioning personnel on SIGINT-related topics.
- Obtain SIGINT-related collection requirements that can be answered by human sources.

Measurement and Signature Intelligence:

- Support measurement and signature intelligence (MASINT) analysis by using HUMINT sources to identify or confirm the information obtained through MASINT collection.
- Cue requirements managers and others involved in MASINT tasking on locations or activities for the location of MASINT sensors.
- Coordinate for information to verify information obtained through HUMINT collection.
- Provide MASINT-related CEDs for MASINT analysis.
- Coordinate for technical support as required when questioning personnel on MASINT-related topics.
- Obtain MASINT-related collection requirements that can be answered by human sources.

Technical Intelligence:

- Support TECHINT analysis by using HUMINT sources and documents to provide information concerning threat equipment and to support TECHINT materiel analysis. This includes, for example, the interrogation or debriefing of equipment operators of the translation of operators manuals for a piece of equipment being investigated.
- Coordinate for current information on equipment capabilities to use in the questioning of sources.
- Cue requirements managers and others involved in TECHINT tasking on locations or activities for TECHINT collection. This includes forwarding the identification and location of equipment of TECHINT interest obtained during HUMINT collection operations.
- Coordinate for TECHINT information to verify information obtained through HUMINT collection.
- Provide information from CEDs in support of TECHINT.
- Coordinate for technical support as required when questioning personnel on subjects related to areas of TECHINT interest.
- Obtain TECHINT-related collection requirements that can be answered by human sources.

Counterintelligence:

- Support CI analysis by using HUMINT sources to provide information concerning adversary intelligence collection capabilities and operations.
- Identify human and document sources that have information of CI interest.

- Cue requirements managers and others involved in CI tasking individuals or activities of CI interest.
- Coordinate for CI information to verify information obtained through HUMINT collection.
- Provide information from CEDs in support of CI.
- Coordinate for CI support as required when questioning personnel on topics related to areas of CI interest.
- Obtain CI-related collection requirements that can be answered by human sources.
- Integrate CI elements into HUMINT collection operations as applicable.

Open-Source Intelligence:

- Support open-source intelligence (OSINT).
- Provide open source maps, charts, phone directories, business directories, newspapers, video and audio media (including tapes and compact discs) to the appropriate J/G/S2X and Intelligence Community agencies and liaison officers.

OTHER ORGANIZATIONS

4-58. In addition to MI units, HUMINT collection organizations frequently conduct coordination with other military organizations.

- **Military Police Units:** Close coordination between HUMINT collectors and MPs is mutually beneficial. The MPs are responsible for maneuver and mobility support, area security, internment and resettlement, law and order, and police intelligence operations. Both activities (HUMINT collection and MP operations) require close contact with the local civilian, refugee, and detainee populations. HUMINT collection at checkpoints and at EPW and other detainee collection points must be coordinated with the MPs, who are normally responsible for internment and resettlement operations. In return, the HUMINT collectors, because of their screening and questioning of these population groups, can help facilitate the MP's population control missions by providing information about the population's activities and intentions that may be of MP concern. At EPW/detainee collection points, HUMINT collectors should arrange with the MP leadership to be allowed to debrief MPs since MPs are in regular contact with the detainees. This does not constitute tasking. Information collected in this manner may provide valuable insight, which can aid the collector in formulating approach strategies. MPs should be debriefed in such a way so as not to interfere with their mission. Liaison with the MP chain of command is vital to gain their support and assure them that HUMINT collection will not interfere with MP operations. Joint patrols containing MPs and HUMINT collectors can also be mutually beneficial in many situations.
- **Criminal Investigation Division (CID) and Provost Marshal Office (PMO):** The goals of HUMINT collection and those of the MPs (particularly CID) are different. CID and PMO are concerned with

identification and apprehension of criminal elements. The goal of HUMINT collection is the collection of information in response to PIRs that in many situations are centered on force protection. In the situation where the threat includes a criminal element, the HCTs might collect OB type information on the criminal element to ascertain their activities and threat to friendly forces. HUMINT collectors are not trained to conduct criminal investigations and must not be used for this purpose. Criminal investigators and HUMINT collectors must carefully coordinate their activities as necessary. HUMINT collectors are required to report to the proper agency information collected on criminal activities that the HUMINT collectors uncover in the normal course of their activities.

- **Psychological Operations Units:** As with the MP force, HUMINT collectors and PSYOP units are often interested in the same target audience but for different reasons. PSYOP units are interested in modifying the target audience beliefs and actions to be more supportive of US goals. Normally, HUMINT collection elements coordinate with PSYOP elements to obtain information concerning the motivational factors and cultural value systems of the individuals to be questioned. PSYOP units, as a part of their normal operations, develop detailed analysis concerning psychological and cultural factors of friendly and hostile elements in the AO. Such information will help HUMINT collection personnel to understand the source's attitude, value system, and perception; it will also help to obtain information more rapidly. At the same time, PSYOP units often will develop collection requirements to determine local attitudes and for information on the effectiveness of PSYOP campaigns. HUMINT collectors can be tasked to collect on these requirements if they are included as PIRs.
- **Civil Affairs Units:** The CA mission often places CA units in contact with the HUMINT collection target audience. If possible, HUMINT collection missions can be established in coordination with CA missions. If the HUMINT collection mission is viewed as having the potential of interfering with the CA mission and coordinated operations are not possible, CA personnel can still be sensitized to intelligence collection requirements and debriefed by HUMINT collectors as part of a friendly force debriefing operation.
- **Drug and Law Enforcement Agency Operations:** Personnel who are employees of DOD intelligence components may be assigned to assist Federal law enforcement authorities and, when lives are endangered, state and local law enforcement authorities; provided such use is consistent with, and has been approved by an official authorized pursuant to DOD Directive 5525.5, Enclosure 4 (reference (i)). Such official shall ensure that the General Counsel of the providing DOD component concurs in such use. Assistance may be rendered to LEAs and security services of foreign governments or international organizations in accordance with established policy and applicable SOFAs, provided that DOD intelligence components may not request or participate in activities of such agencies undertaken against US persons that would not be permitted activities of such components under the procedures of AR 381-10. HUMINT collectors may assist

foreign law enforcement authorities, with prior approval of the J2X. Under no circumstances will HUMINT collectors assist any US or foreign law enforcement authorities in any manner without prior approval by competent authority after a legal review of the proposal.

- **Maneuver Units:** HCTs may be utilized in GS for coverage of an AOIR or in DS to support a specific maneuver unit. The type of coordination needed with maneuver units will vary depending on the type of support relationship the HCT has. HCTs operating in GS should coordinate with maneuver unit commanders when the HCT will be operating in that unit's AO. At a minimum, the HCTs should announce their presence and request information on any conditions or ongoing situations that may affect on the conduct of their mission. An HCT operating in DS of a specific unit will coordinate with the unit for force augmentation to HUMINT patrols as needed in accordance with force protection requirements. The HCT leader should also coordinate with the supported unit's S2 for involvement in debriefings of returning patrol members, checkpoint personnel, convoy leaders and others. HCT leaders may also coordinate to be included in the unit's reconnaissance patrols, as appropriate.
- **Combat Service Support Units:** Current and future combat operations will be conducted in a noncontiguous battlespace. CSS formations and units may be an excellent source for HUMINT collectors. In many situations, DPs and refugees will perceive CSS activities as non-threatening and an activity which can provide them with aid and comfort. CSS operations will naturally draw DPs and refugees hoping to receive support. This could provide opportunities for HUMINT collectors to access this sector of the population. CSS unit S2s should conduct patrol debriefings of returning convoy personnel to capture observations made during convoys, with the goal of cross-cueing the supporting HCT, CI team, or law enforcement element as appropriate.

STAFF COORDINATION

4-59. Successful HUMINT collection operations require support from the staff elements of the supported unit. These elements are collectively responsible for the planning that results in HUMINT tasking. Below is a partial list of the staff responsibilities that affect HUMINT collection:

- G1/S1 HUMINT-related responsibilities include but are not limited to—
  - Supervising the medical support furnished to EPW/detainees.
  - Maintaining a list (by language and proficiency) of qualified linguists within their command.
  - Coordinating with the G4 or G5 for procurement and payment of other interpreters and translators needed to perform intelligence and non-intelligence duties.
  - Ensuring the echelon's OPLAN contains complete provisions for handling and evacuating detainees, refugees, DPs, and local civilians

as required. This plan must satisfy the interests of all other staff officers and provide for—

- Ensuring humane treatment of all personnel.
- Promptly evacuating personnel from the combat zone.
- Integrating procedures for the evacuation, control, and administration of personnel with other combat service (CS) and CSS operations.
- Ensuring delivery of mail to EPWs and other detainees.
- Maintaining detainee (including EPW) statistics.
- Providing administration and control of detainee currency and pay records, including coordinating with appropriate intelligence authorities about investigating large sums of money.

- G2/S2 is responsible for developing intelligence in support of unit operations. The G2/S2 at division and higher and in the interim BCT is supported by a G/S2X and normally a HAT in the performance of his HUMINT-related functions. His HUMINT-related responsibilities include but are not limited to—
  - Obtaining intelligence through intelligence reach to support HUMINT collection.
  - Incorporating HUMINT into the ISR plan.
  - Developing the HUMINT annex to the OPORD and OPLAN.
  - Coordinating to provide technical support for all HUMINT collection operations.
  - Ensuring deconfliction and synchronization for all HUMINT collection assets within the unit's AO. A particular effort must be made to coordinate with all DOD military source operations (MSO), and DOD and other government agencies (OGAs) that may be operating in the AO; with the theater J2X, as part of deconfliction. Failure to deconflict with DOD MSO and OGAs may result in compromise of assets and interruption of collection operations and potentially unintended casualties.
    - Obtaining documents and materials of intelligence interest, including visual and audio media and electronic equipment (such as computers, phones, PDAs) taken from detainees, or seized or loaned, in coordination with the Provost Marshal and other elements.
    - Recording, evaluating, and analyzing collected information and providing feedback to HUMINT collectors.
    - Ensuring adequate HUMINT collection and reporting nets and systems are available.
    - Coordinating with the G3 to ensure plans for HUMINT collection operations are included in unit OPLANs.
    - Coordinating with the G3 to ensure that HUMINT collectors are included in unit training plans, rehearsals, and briefbacks.
    - Drafting instructions for handling, evacuating, and exploiting captured enemy personnel and CEDs. (They coordinate with the G3 to ensure draft instructions are included in the command standing operating procedures (SOPs), OPLANs, and OPORDs.)
    - Projecting capture rates as well as refugee and DP rates.

  - Determining the number of interpreters and translators needed to perform intelligence duties.
  - Coordinating with other agencies and HUMINT collectors for intelligence sharing.
  - Controlling the procedures used to process and grant clearances to the interpreters and translators as required.
  - Coordinating with the civil-military operations (CMO) officer for intelligence screening of local nationals, refugees, and DPs.
  - Coordinating with SJA for legal review of proposed operations.
- G3/S3 is responsible for operations, plans, organization, and training. His HUMINT collection-related responsibilities include but are not limited to—
  - Ensuring the inclusion of HUMINT collection units in the main body of OPLANs and OPORDs under **Tasks to Subordinate Units** and **Task Organization**.
  - Ensuring instructions for handling, evacuating, and exploiting captured enemy personnel and CEDs in all unit command SOPs, OPLANs, and OPORDs.
  - Incorporating HUMINT collection operations into future plans and operations.
  - Ensuring subordinate units are trained in proper handling and evacuation of captured enemy personnel, materiel, and CEDs.
  - Ensuring that the subordinate elements are trained in OPORDs including ROE and the proper handling of local civilians, foreign nationals, refugees, and DPs.
  - Obtaining, organizing, and supervising employment of additional personnel as guards for EPWs and other detainees where MP assets are not available or insufficient.
  - Tasking the Division/Brigade Engineer Officer in conjunction with the G2/S2 to conduct a site survey for possible EPW/detainee holding area facilities within the operational area. Priority should go to existing facilities needing little or no renovation to meet operational requirements. If suitable facilities cannot be found, the engineer officer should provide detailed facilities design specifications to the G4/S4 for coordination and development of contracted resources.
- G4/S4 responsibilities related to HUMINT collection include but are not limited to—
  - Developing command policy for evacuation and internment of captured enemy personnel, and evacuation and safekeeping of CEE and CEDs.
  - Coordinating contracts for real estate and construction of source-holding facilities if local capabilities are not available. Ideally, existing facilities will be occupied and renovated whenever possible.
  - Collecting and distributing captured enemy supplies. (This is coordinated with the intelligence and operations staffs.)
  - Procuring and distributing rations to personnel holding areas.
  - Transporting EPWs and other detainees in a timely, safe manner to the appropriate facility for processing.

- Determining requirements for use of source labor for the logistical support needed in source-handling operations.
- Providing logistical support to interpreter personnel.

- G5/S5 responsibilities related to HUMINT collection include but are not limited to—
  - Coordinating with local US government, personnel staff representatives, and HN armed forces for procuring native linguists for interpreter support.
  - Coordinating military support of populous.
  - Providing technical advice and assistance in reorientation of sources and enemy defectors.
  - Coordinating MI aspects of CMO activities with the G2.

ADDITIONAL SUPPORT

4-60. In addition to the major staff elements, a HUMINT collection element requires support from several other elements in order to conduct operations. These elements are discussed below.

- The US Army Criminal Investigation Command is the organization with primary responsibility for investigating allegations of criminal acts or reportable incidents committed by or against detainees.
- The SJA can provide legal support and advice on the interpretation and application of applicable law and policy. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOS. The SJA is also a channel for reporting known or suspected reportable incidents of abuse or inhumane treatment.
- The Inspector General is a channel for reporting known or suspected reportable incidents of abuse or inhumane treatment.
- The PMO is the channel for reporting criminal activity other than reportable incidents, but also can be used for reporting known or suspected reportable incidents.
- The Chaplain can also receive reports of reportable incidents.
- The G7 provides information on Information Operations and conducts liaison with PSYOP, the Electronic Warfare Officer, the Military Deception Officer, and Operations Security personnel.

PART TWO

HUMINT Collection In Military Source Operations

Part Two discusses HUMINT collection as it pertains to MSO. The Secretary of Defense (SECDEF) has established a DOD-wide HUMINT Enterprise consisting of the following executors: The Office of the Secretary of Defense (OSD), the Combatant Commands (COCOMs), the Military Departments, the Defense Intelligence Agency (DIA). All Defense HUMINT Enterprise executors support and satisfy Defense requirements by employing their available resources and capabilities.

MSO refer to the collection of foreign military and military-related intelligence by humans from humans. MSO are conducted under SECDEF authorities, to satisfy DOD needs in compliance with DOD policy. Within the Army, MSO are conducted by trained personnel under the direction of military commanders. These specially trained personnel may employ the entire range of HUMINT collection operations. MSO sources include one-time, continuous, and formal contacts, from contact operations; and sources from interrogations, debriefings, and liaison activities.

Each type of MSO activity has specific operational requirements, specific legal restrictions, and operational guidelines. HUMINT collection activities in each of these categories require specific approval, coordination, and review. MSO include human source contact operations, debriefing, liaison, and interrogations. This chapter introduces each of these collection operations.

Chapter 5

HUMINT Collection

HUMINT COLLECTION OPERATIONS

5-1. Full spectrum operations require focused MSO with strong capabilities dispersed across the battlefield. In offensive and defensive operations, the HCTs need to be placed in support of the engaged maneuver battalions. In stability and reconstruction operations and civil support operations, the HUMINT teams need to be located in battalion AOs throughout the AOIR.

5-2. The rapid pace of operations, the need to provide near-real time (NRT) support of command decisions and the inherent time delays in moving detainees, including EPWs and civilian refugees to centralized locations, necessitate the dispersion of HUMINT collection assets to forward areas in

support of critical operations rather than their retention at detainee and refugee holding facilities at echelons corps and below. This forward deployment gives HUMINT collectors earlier access to sources and is facilitated by enhanced communication and automation capabilities down to the collection team level.

5-3. All operations are different, and deployment of HUMINT assets is METT-TC dependent. Brigades need the capability to provide 24-hour HUMINT collection capability to each battalion AO. The command relationship of the HUMINT collection capability is also METT-TC dependent. The OMT should be located at the echelon that is best able to manage and support the HCTs and to provide the best capability to answer the commander's PIRs.

5-4. The Division and Corps elements should cover their respective areas not covered by their subordinate commands. They also, as needed, reinforce those target areas that are most effective in answering their respective command PIRs already covered by subordinate command capability. EAC HUMINT units normally are responsible for supporting theater or national requirements and providing HUMINT support at theater level facilities such as the JIDC. The EAC units will also augment the echelon below corps units and conduct source operations in the Corps area as required. Operations, particularly in challenging terrain and in stability and reconstruction environments, may require additional HUMINT assets normally obtained from the RC.

HUMAN SOURCE CONTACT OPERATIONS

5-5. HUMINT collection requires the contact between the HUMINT collector, who attempts to gather information through a variety of HUMINT collection techniques, and a human contact, who hopefully has the information that the HUMINT collector wants and who can be convinced to divulge the information. Operations with formal contacts are only conducted by HUMINT collectors and CI agents who are specifically trained and authorized to do so. There are three levels of contacts:

- One-time contact.
- Continuous contact.
- Formal contact.

5-6. The basic goal of all levels of contact is to collect information in response to collection tasking; however, only under certain conditions can HUMINT collectors task contacts to get information for them (see para 5-28). Understanding the types of contacts is key to understanding each type of human source contact operation. The following levels are not all-inclusive nor are the listed categories exclusive. For example, a contact who was initially a one-time contact (such as a walk-in) may later be developed into a continuous contact. A continuous contact may be developed into a formal contact, who can then be tasked, trained, and paid. There is no limit on the number of times a team can meet contacts without recruiting them and making them into a formal contact.

ONE-TIME CONTACT

5-7. The one-time contact is a source of information of value that was, and will be, encountered only once. In all operational environments the HUMINT collector will frequently encounter a source only once, particularly at lower echelons. This may be a local civilian encountered during a patrol, a detainee who is quickly questioned and then evacuated, or a refugee at a checkpoint.

5-8. In addition to the information obtained from a one-time contact, the HUMINT collector must make a reasonable effort to obtain as much basic data as possible about the one-time contact. Complete name, occupation, address, and other basic data of this source are crucial for a thorough analysis of the information provided. The one-time contact and the information he provides cannot be assessed and evaluated independently; however, the information provided by a one-time contact must be reported and corroborated through other HUMINT sources and even other intelligence disciplines.

5-9. Contact reports must be filed with the OMT and source registries maintained in accordance with FM 34-5 (S//NF), AR 381-100 (S//NF), and DIAM 58-11 (S//NF) in order to support analysis of information obtained. If a one-time contact is encountered for a second time and again provides information of value, then the contact may be thereafter treated as a continuous contact.

5-10. A walk-in is a one-time contact who volunteers information of value to US forces on his own initiative. The walk-in source may volunteer information by approaching an HCT, other ISR elements, or US forces or civilian personnel anywhere in the AO. Each unit must have in place a program to identify, safeguard, and direct the walk-in to the appropriate collection asset, to be screened and debriefed as required. For example, a walk-in who wanted to report a crime would be directed to the PMO rather than to a HUMINT collector.

5-11. The collection asset will screen the walk-in to determine the type of information the source has and to determine and evaluate the reliability of the individual. After identifying the type of information, the collector determines if he has the jurisdiction to collect that information. If, for example, the walk-in wishes to report a crime, the collector refers that individual to the proper criminal investigative agency.

5-12. Systematic questioning, deception detection techniques, and cross-checking of information are used extensively in the evaluation process. Concurrently, there are national level directives, DOD directives, and Army regulations that direct specific actions to be taken with a walk-in. When dealing with a walk-in source, HUMINT collectors must guard against adversary intelligence collection. They must also protect legitimate sources of information. The walk-in is thoroughly debriefed on all areas of information relevant to collection requirements, and any information of value is reported.

5-13. On occasion, the HUMINT collector may determine that a one-time contact has the potential to become a continuous contact or a formal contact. This is referred to as a developmental lead. A developmental lead is an

individual identified through social and professional status, leads, source profiling, or other techniques, who has knowledge required by the commander. A developmental lead is any person the HUMINT collector expects to see or would like to see again, or a person who indicates that they intend to return in the future.

5-14. When a HUMINT collector identifies a developmental lead, he reports his interest in elevating the source to continuous or formal contact status as soon as possible to the OMT. Although not every developmental lead becomes a source of information, the HUMINT collector should see each developmental lead as a potential source of information and apply the appropriate security measures. The developmental lead is continuously assessed to verify his placement and access to the type of information the HCT is seeking. Additionally, the HUMINT collector continuously assesses the motivation and characteristics of the developmental lead.

5-15. A one-time source cannot be tasked to collect information, but can be sensitized to information in which the HUMINT collector is interested. For example, if a walk-in source provides information on activity in a house in his neighborhood, he might ask if the collector would be interested in more of the same type information in the future. The HUMINT collector cannot tell him to go get more information, but can indicate that he would listen if the walk-in returned with more information on the topic. If the walk-in returns a second time, he must be handled as a continuous contact.

CONTINUOUS CONTACTS

5-16. Continuous contacts are individuals who have been identified as having more information than could be obtained through a one-time contact, and have been met again by HUMINT collection personnel for the purpose of collecting additional information. HUMINT collectors do **not** task continuous contacts, but they can be sensitized in the same way as one-time contacts. Continuous contacts provide their knowledge through informal debriefings and elicitation.

5-17. All contacts who are seen more than once by HUMINT collectors must be tracked by registering them in the Source Registry and reporting the contacts to the OMT. As an example, a one-time contact who reported information to a HCT contacts them again with follow-up information. That person will now be registered as a continuous contact and tracked by the OMT. This registration process helps to prevent the same information from being collected by multiple collectors from the same contact without realizing it. See AR 381-172 (S//NF) and FM 34-5 (S//NF) for further information on source registration and for the required forms. Types of continuous contacts are discussed below.

Local National and Third-Country National Employees

5-18. Local national and third-country national employees are non-US personnel from either the country in which the US forces are operating or a third country who are either employed by US forces directly or through a contractor to provide logistical support and services. One of the purposes of locally employed personnel screening is to assess these individuals as

potential sources of information. Local national and third-country national employees can be a prolific source of information about local attitudes and events, particularly in a restrictive environment where US contact with the local population is curtailed. Their information can also be significant in a force protection role. The HUMINT collector must register these individuals with the J/G2X. While the HUMINT collector is assessing the local national employee as an intelligence source, CI agents are assessing the same source pool as potential security risks.

5-19. Coordination between HUMINT collectors and CI elements is essential for deconfliction and to avoid duplication of effort. If the HUMINT collector identifies an employee that may be of CI interest, he should immediately notify the appropriate CI unit.

Displaced Personnel and Refugees

5-20. DPs and refugees are excellent sources of information about denied areas and can be used to help identify threat agents and infiltrators. The degree of access HUMINT collectors have to DPs is dependent on the OPORDs, ROE, and SOFAs in effect. HUMINT collectors can work with CA or other programs dealing with DPs or refugees.

5-21. DPs and refugees are normally considered one-time sources but may be incorporated into other long-term collection programs if their degree of knowledge warrants this. In this case, adherence to the restrictions involving source operations is necessary. Those restrictions can be found in AR 380-10, AR 381-100 (S//NF), DIAM 58-11 (S//NF), DIAM 58-12 (S//NF), and other publications as well as existing ROE and SOFAs.

US Forces

5-22. US forces have many opportunities to interact with the local population in the normal course of their duties in operations. This source perhaps is the most under-utilized HUMINT collection resource. Some US forces, such as combat and reconnaissance patrols, are routinely tasked and debriefed by the appropriate level G2/S2. Others, such as medical teams or engineers who have extensive contact with the local population, should also be debriefed.

5-23. Commanders and staff members who serve as liaison with the local population and local government officials can be fruitful sources of information. CA, PSYOP, MP, and other elements also have legitimate reasons to conduct liaison with local authorities and should be debriefed as appropriate. The friendly force debriefing effort can succeed only with command emphasis.

5-24. HUMINT collection elements need to coordinate with local units to identify those individuals who would be most profitable to debrief and to further coordinate with them for time to conduct the debriefing. Although the S2 and S3 can and should task their soldiers to conduct collection tasks during the course of their normal duties, HUMINT collectors must ensure that their friendly force debriefing effort does not interfere with the primary mission accomplishment of the soldiers being debriefed. HCTs should ensure that the necessary staff S2s and S3s are aware of the HUMINT collection

requirements and request that the staffs incorporate these into their respective collection taskings. The results of debriefings by units should also be disseminated to the HCTs for source development, collection targeting, and analysis.

Official Liaison

5-25. Liaison with local military, government, or civilian agency officials provides an opportunity to collect information required by the commander. The HUMINT collector meets with these officials to conduct liaison, coordinate certain operations, collect information, and obtain leads to potential sources of information. Elicitation is the primary technique used with liaison contacts, although in many cases there is a more formal exchange of information. Information obtained by these elements through liaison normally tends to reflect the official positions of their superiors and may not be entirely accurate or complete.

Detainees

5-26. A detainee is any person captured or otherwise detained by an armed force. An EPW is a detainee who meets the criteria of Articles 4 and 5 of the GPW. (See Appendix A.) Detainees may be interrogated. They are frequently excellent sources of information but in many instances the access of the HUMINT collector to the detainees may be curtailed.

5-27. For example, when supporting a counterinsurgency, the supported government may consider all captured insurgents to be criminals and not allow US forces access to them. In these instances, US HUMINT collectors should attempt to sit in during local questioning; they could submit questions or, at a minimum, coordinate to receive the reports from local authority questioning. US HUMINT collectors must remember that regardless of the legal status of the detainees they must be treated in a manner consistent with the Geneva Conventions. (See Appendix A.)

FORMAL CONTACT

5-28. Formal contacts are individuals who have agreed to meet and cooperate with HUMINT collectors for the purpose of providing information. HUMINT collectors who have met with a particular continuous contact three or more times should consider assessing him for use as a formal contact. Formal contacts meet repeatedly with HUMINT collectors, and their operation and tasking must be carried out in accordance with AR 381-172 (S//NF), DIAM 58-11 (S//NF), and DIAM 58-12 (S//NF).

5-29. Formal contacts are generally local nationals or third-country national employees. Knowledge of their meeting with HUMINT collectors is restricted. This can be accomplished by either disguising the fact that the HUMINT collection personnel are indeed HUMINT personnel, or by concealing the purpose of overt meetings with HUMINT personnel. HCTs take extraordinary measures to protect their relationship with these contacts. Depending on METT-TC factors, meetings with formal contacts may range from overt meetings, which are conducted discreetly in order to protect the

relationship between the source and HUMINT collectors, to meetings whereby only the collector and the source know the meeting has occurred. When contact operations are conducted using this methodology, the operation must be coordinated in accordance with the Under Secretary of Defense for Intelligence (USD(I)) policy cited in Appendix J. Specific direction regarding documentation required for recruitment, and the designation of approval authority (usually the J/G2X) for recruitment of a formal contact, will be specified in Appendix 5 (HUMINT) of Annex B (Intelligence) to the governing OPLAN or OPORD.

DEBRIEFING OPERATIONS

5-30. Debriefing operations refer to the systematic questioning of individuals not in the custody of the US, to procure information to answer collection tasks by direct and indirect questioning techniques. The primary categories of sources for debriefings are friendly forces and civilians including refugees, DPs, and local inhabitants.

5-31. Debriefing operations are those operations directed towards collecting information from a segment of the target population using primarily debriefing techniques. These debriefing operations are separate from the G2/S2 debriefing program to debrief personnel returning from missions. Debriefing operations often include the debriefing of personnel who may not usually be debriefed as part of their assigned duties.

5-32. Normally Army debriefing operations will be directly related to collection tasks at the operational and tactical levels. Strategic debriefing of high-level personnel in response to theater and national level requirements is often under the purview of the DIA/DH. Army HUMINT collectors frequently participate in this type of collection, which is under the control, rules, regulations, and operational guidance of DH.

PRINCIPLES AND GUIDELINES

5-33. Debriefing operations are conducted under the guidelines of DIAM 58-11 (S//NF) and DIAM 58-12 (S//NF). They are further subject to applicable execute orders and the specific ROE and classified "umbrella concept" that apply to the specific AO.

OPERATIONAL CONSIDERATIONS AND REQUIREMENTS

5-34. Debriefing requires relatively unconstrained access to the target audience. Debriefing operations are frequently constrained by the umbrella concept, overt operational proposal (OVOP), and OPORDs. Debriefing is a time- and resource-demanding operation that often shows limited immediate results. Since the potential target audience is so large, debriefing operations require careful planning and careful screening and selection of specific targets.

DEBRIEFING OPERATIONS AT THE TACTICAL LEVEL

5-35. Debriefing operations at the tactical level include the debriefing of elements of the local and transient civilian population in support of ongoing tactical operations. This is different from but often supportive of tactical SCOs as described in Chapter 1. Although tactical SCOs use specific identified sources to obtain and report information, tactical debriefing operations use one-time and continuous contacts to answer requirements. Tactical debriefing operations are frequently combined with tactical interrogation operations and may identify potential sources for tactical SCOs.

REFUGEE FACILITY AND CHECKPOINT OPERATIONS

5-36. Refugee facility and checkpoint operations involve placing HCTs at points where US forces expect to encounter large numbers of refugees. Deployment of HUMINT collectors at checkpoints is normally preferred due to their ability to collect and report more timely information. As in the questioning of detainees, the debriefing of refugees should not delay their movement out of the danger area.

5-37. Checkpoint debriefing is normally done in coordination with MP or combat forces that are manning the checkpoint. Debriefing at refugee camps is used to obtain longer term and less immediate information. HUMINT collection units established at refugee camps coordinate their activities with the CA, MP, NGO, or other organizations that has responsibility for operating the refugee camp.

5-38. In internment facilities operated by the MPs, HUMINT collectors coordinate with MPs for access to the detainees and for guard support. In facilities operated by NGOs, HUMINT collectors coordinate with NGOs for permission to speak to the refugees. NGOs are civilian agencies and may decide not to permit HUMINT collectors to have access to refugees.

FRIENDLY FORCE DEBRIEFING

5-39. Every member of the friendly force is a potential source for HUMINT collection. Friendly force personnel frequently have contact with the threat, civilian population, or the environment. Although many individuals report their information in the form of combat information, many do not report the information, do not realize its significance, or do not know how to report key information. Frequently a systematic questioning by a trained HUMINT collector will identify key information that can contribute to the intelligence picture and help an individual recall details. It also helps to place his information into a systematic format for the analyst to use.

5-40. HUMINT collectors debrief selected friendly force personnel including combat patrols, aircraft pilots and crew, long-range surveillance teams, deep insert special forces teams, and other high-risk mission personnel. Often the personnel assigned to a sector of responsibility are the first to notice changes in the attitude of the local populace or differences in the mission environment.

5-41. They are also able to provide indicators concerning the mission environment. HUMINT collectors also conduct debriefings of returned

prisoners of war (POWs), freed hostages, returned US defectors, and soldiers reported as missing in action. These debriefings help to determine enemy methods of operations, enemy intentions, POW handling and interrogations, enemy weaknesses, information concerning other POWs not returned, and battle damage assessment (BDA).

5-42. HUMINT assets lose access to valuable information if they are not regularly coordinating with the following elements:

- **Cavalry Troops, Unit Patrols, and Scouts.** Unit patrols and scouts have a unique view of the battle area that sensors cannot detect. During operations, units and scouts often patrol villages or populated areas that are contentious and therefore of interest. The unit will gain valuable information on the current status of the AO, potentially answering intelligence requirements, through mission reporting and debriefing by their unit S2 or HUMINT collector.
- **Military Police.** HUMINT collection assets work with the MPs who gain area knowledge through their extensive foot patrols and vehicular convoys. MPs also staff checkpoints and traffic control points (TCPs) where they interact with large numbers of the civilian populace and encounter people and situations that often answer intelligence requirements. MP guards at any internment facility are a valuable source of information on the attitude and behavior of detainees. HUMINT collectors should coordinate with the MP detainee facility commander in order to obtain information on detainees obtained through custodial observation and conversations.
- **Civil Affairs.** CA units have daily interaction with the civilian populace including key members of the civilian community such as politicians, technical personnel, and military leadership.
- **Psychological Operations.** PSYOP teams often interview civilians on the battlefield to determine the effectiveness of friendly and threat PSYOP campaigns. PSYOP elements also gather information on political, social, and other PSYOP requirements. PSYOP elements produce and disseminate intelligence products based partially on their interaction with the civilian populace.
- **Special Operations Forces.** The Special Operations Forces (SOF) team often has greater access to humans and areas on a battlefield than any other collection asset. Their observation of and interaction with the local population provides them access to information that often answers collection requirements. The following are examples of these types of collection missions:
  - Special reconnaissance missions into denied territory to satisfy intelligence gaps or to confirm information from another source.
  - Unconventional warfare (UW) missions normally of a long duration. SOF are inserted into hostile territory to conduct sensitive operations that support US tactical and national objectives. During these missions, SOF units often come in contact with the local population and gather information that meets intelligence requirements.
- **Long-Range Surveillance.** Direct observation and reporting on targets such as activities and facilities may provide timely and

accurate intelligence to support a decision or cross-cue other collection capabilities. Long-range surveillance (LRS) is often employed when discreet observation of an activity is necessary over a long period of time or when a collection system that can respond to redirection is necessary.

- **Criminal Intelligence Operations.** CID personnel, in cooperation with MP soldiers, play a key role by linking criminal intelligence to specific groups and events. The criminal intelligence collection effort specifically targets weapons, drugs, organized crime, and identities of smuggling routes. The identification of smuggling routes results in a significant increase in numbers of weapons being confiscated. The timely transfer of criminal intelligence products to tactical units enables a rapid response to serious confrontations, increased confiscation of arms and ammunition, and improved stability in a TF and AO. The Fusion Cell within the ACE develops intelligence products from national, theater, and operational sources. Due to the significant threat that criminal elements pose, CID military agents and CID civilian analysts may be attached to the Fusion Cell to facilitate the police intelligence function.

STRATEGIC DEBRIEFING OPERATIONS

5-43. Strategic debriefing is debriefing activity conducted to collect information or to verify previously collected information in response to national or theater level collection priorities. This avoids surprises of a strategic nature and is used to support long-range strategic planning. Strategic debriefing is conducted in peacetime as well as in wartime. It often fills intelligence gaps on extremely sensitive topics or areas. The sources for strategic debriefing include but are not limited to émigrés, refugees, displaced persons, defectors, and selected US personnel. Strategic debriefing guidance is provided in DIAM 58-11 (S//NF), DIAM 58-12 (S//NF), and DODD 3115.09, "DOD Intelligence, Interrogations, Detainee Debriefings, and Tactical Questioning."

5-44. Strategic debriefing is conducted in a non-hostile, business-like manner. The rapport posture is usually amicable as the source is usually willingly answering national level intelligence needs. Although voluntary sources may not be motivated by a desire for money or other material incentives, it is necessary to ensure that any promised incentives are delivered. The time used in a strategic debriefing can range from days to years. Sources typically have high-level backgrounds in scientific, industrial, political, or military areas.

5-45. Information gathered as strategic intelligence is categorized into eight components. Each of these components can be divided into subcomponents. These components and subcomponents are neither all-encompassing nor mutually exclusive. This approach enhances familiarization with the types of information included in strategic intelligence. An easy way to remember these components is the acronym "**BEST MAPS**":

Biographic Intelligence
Economic Intelligence
Sociological Intelligence
Transportation and Telecommunications Intelligence

Military Geographic Intelligence
Armed Forces Intelligence
Political Intelligence
Science and Technological Intelligence

- **Biographic intelligence** is the study of individuals of actual or potential importance through knowledge of their personalities and backgrounds. For further guidance on collecting and reporting biographic intelligence, see DIAM 58-12 (S//NF). The subcomponents are—
  - Educational and occupational history—civilian and military backgrounds of individuals.
  - Individual accomplishment—notable accomplishments of an individual's professional or private life.
  - Idiosyncrasies and habits—mannerisms and unusual lifestyles.
  - Position, influence, and potential—present and/or future positions of power or influence.
  - Attitudes and hobbies—significant interests that may affect an individual's accessibility.
- **Economic intelligence** studies economic strengths and weaknesses of a country. The subcomponents are—
  - Economic warfare—information on the diplomatic or financial steps a country may take to induce neutral countries to cease trading with its enemies.
  - Economic vulnerabilities—the degree to which a country's military would be hampered by the loss of materials or facilities.
  - Manufacturing—information on processes, facilities, logistics, and raw materials.
  - Source of economic capability—any means a country has to sustain its economy (for example, black market trade, legitimate business or trades, and imports and exports).
- **Sociological intelligence** deals with people, customs, behaviors, and institutions. The subcomponents are—
  - Population—rates of increase, decrease, or migrations.
  - Social characteristics—customs, morals, and values.
  - Manpower—divisions and distribution within the workforce.
  - Welfare—health and education.
  - Public information—information services within the country.
- **Transportation and telecommunications intelligence** studies systems dedicated to and used during military emergencies and peacetime.

- **Military geographic intelligence** studies all geographic factors (physical and cultural) that may affect military operations. Physical geography is concerned with natural or manmade geophysical features. Cultural geography provides demographics information.
- **Armed forces intelligence** is the integrated study of the ground, sea, and air forces of the country. The subcomponents are—
  - Strategy—military alternatives in terms of position, terrain, economics, and politics.
  - Tactics—military deployments and operations doctrine.
  - OB—location, organization, weapons, strengths.
  - Equipment—analysis of all military materiel.
  - Logistics—procurement, storage, and distribution.
  - Training—as carried out at all echelons to support doctrine.
  - Organization—detailed analysis of command structures.
  - Manpower—available resources and their conditioning.
- **Political intelligence** studies all political aspects which may affect military operations. The subcomponents are—
  - Government structure—organization of departments and ministries.
  - National policies—government actions and decisions.
  - Political dynamics—government views and reactions to events.
  - Propaganda—information and disinformation programs.
  - Policy and intelligence services—organization and functions.
  - Subversion—subversive acts sponsored by the government.
- **Science and technological intelligence** studies the country's potential and capability to support objectives through development of new processes, equipment, and weapons systems. The subcomponents are—
  - Weapons and weapon systems.
  - Missile and space programs.
  - Nuclear energy and weapons technology.
  - NBC developments.
  - Basic applied science.
  - Research and development systems.

LIAISON OPERATIONS

5-46. Liaison is conducted to obtain information and assistance, to coordinate or procure material, and to develop views necessary to understand counterparts. Liaison contacts are normally members of the government, military, law enforcement, or other member of the local or coalition infrastructure. The basic tenet of liaison is *quid pro quo*. An exchange of information, services, material, or other assistance is usually a part of the transaction. The nature of this exchange varies widely depending upon the culture, location, and personalities involved.

5-47. Because the nature of liaison tasks varies widely, the general goals of the liaison operation and the objective of each liaison contact should be

clearly defined. The objective should include the type of information to be collected, methods of operations unique to the area, and the command objectives. Additionally, the collector should know limitations on liaison activities. These limitations include—

- Prohibitions against collecting certain types of information or contacting certain types of individuals or organizations.
- Memorandums of understanding with other echelons which delineate each echelon's AOR and AORs for subordinate units.
- Coordination requirements per DCID 5/1 dated 19 December 1984, which are required for selected types of liaison activities.

5-48. Administrative considerations include—

- Type, method, and channels of reporting information obtained from liaison activities.
- Project and contingency fund site numbers to be used.
- Funding and incentive acquisition procedures.
- Limitations on the use of ICFs or incentives.
- Reporting system used.
- Authority under which the specific liaison program is conducted and guidelines for joint and combined operations are set.

5-49. Benefits of liaison include—

- Establishing working relations with various commands, agencies, or governments.
- Arranging for and coordinating joint and combined operations.
- Exchanging operational information and intelligence within legal limits.
- Facilitating access to records and personnel of other agencies not otherwise accessible.
- Acquiring information to satisfy US requirements.
- Accessing a larger pool of information.

INTERROGATION OPERATIONS

5-50. HUMINT interrogation is the systematic process of using approved interrogation approaches to question a captured or detained person to obtain reliable information to satisfy intelligence requirements, consistent with applicable law and policy. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs. Interrogation is to be conducted by personnel trained and certified to use legal, approved methods of convincing EPWs/detainees to give their cooperation. Interrogation sources are detainees, including EPWs.

5-51. Definitions of EPWs and rules for their treatment are contained in the Geneva Convention Relative to the Treatment of Prisoners of War (GPW). The definition and rules for the treatment of civilians are contained in the

Geneva Conventions Relative to the Protection of Civilian Persons in Time of War (GC). (See Appendix A.) For persons covered by those Conventions, applicable GPW and GC provisions must be adhered to at all times. (Regarding treatment of detained personnel, see also paragraph 5-74.)

5-52. There is an additional protocol to the Geneva Conventions called Protocol I Additional to the Geneva Conventions, 1977, which also contains definitions of who is a civilian and who is an EPW (Articles 50 and 44). The US has not ratified Protocol I nor does it accept the expanded definition of EPWs that it contains. Requirements managers, J/G/S2X personnel, and HUMINT collectors should understand, however, that coalition military personnel with whom they may work may be bound by Protocol I, and those coalition personnel may be required to treat additional personnel as EPWs. Any questions concerning the GPW and Protocol I must be directed to the SJA office for clarification.

5-53. Interrogation operations are specific operations normally conducted at detainee collection facilities directed at the wide-scale collection of information from detainees using interrogation techniques. Although field interrogations are conducted at all echelons and during all operations in which there are detainees, detention facilities where interrogation operations occur are normally located only at theater or JTF level.

5-54. Compliance with laws and regulations, including proper treatment of detainees, is a matter of command responsibility. Commanders have an affirmative duty to ensure their subordinates are not mistreating detainees or their property. HCT leaders must effectively supervise their subordinate collectors during all interrogation operations. Supervisors must ensure that each HUMINT collector has properly completed an interrogation plan and sound collection strategy, and fully understands the intelligence requirements he is seeking to satisfy prior to beginning an interrogation. NCOs and WOs should regularly participate in interrogations with their subordinates to ensure that the highest standards of conduct are maintained. Interrogation supervisors should also monitor interrogations by video, where video monitoring is available. The production, use, and dissemination of interrogation videos must be tightly controlled by HCT leaders. Such videos must not be released for dissemination outside the Intelligence Community without the express permission of the SECDEF or his delegate.

NON-DOD AGENCIES

5-55. Non-DOD agencies may on occasion request permission to conduct interrogations in Army facilities. These requests must be approved by the JTF commander or, if there is no JTF commander, the theater commander or appropriate higher level official. The interrogation activity commander will assign a trained and certified interrogator to escort non-DOD interrogators to observe their interrogation operations. The non-DOD personnel will sign for any detainee they want to question from the MPs, following the same established procedures that DOD personnel must follow. In all instances, interrogations or debriefings conducted by non-DOD agencies will be observed by DOD personnel. In all instances, non-DOD agencies must observe the same standards for the conduct of interrogation operations and

treatment of detainees as do Army personnel. All personnel who observe or become aware of violations of Army interrogation operation standards will report the infractions immediately to the commander. The personnel who become aware of mistreatment of detainees will report the infractions immediately and suspend the access of non-DOD personnel to the facility until the matter has been referred to higher headquarters. Non-DOD personnel conducting interrogation operations in an Army facility must sign a statement acknowledging receipt of these rules, and agree to follow them prior to conducting any interrogation operations. Non-DOD personnel working in DOD interrogation facilities have no authority over Army interrogators. Army interrogators (active duty, civilian, or contractor employees) will only use DOD-approved interrogation approaches and techniques.

FOREIGN GOVERNMENT INTERROGATORS

5-56. Foreign governments may request to participate, or may be invited to participate in interrogations in Army facilities. Requests for foreign government access to detainees will be forwarded through the operational chain of command for appropriate action pursuant to DOD policy. Foreign government personnel must comply with US DOD policies and observe the same standards for the conduct of interrogation operations and treatment of detainees as do Army personnel. The interrogation activity commander will assign a trained and certified interrogator to escort foreign government interrogators to observe their interrogation operations. The foreign government personnel will sign for any detainee they want to question from the MPs, following the same established procedures that US DOD personnel must follow. In all instances, interrogations or debriefings conducted by foreign government interrogators will be observed by US DOD personnel. In all instances, foreign government interrogators must observe the same standards for the conduct of interrogation operations and treatment of detainees as do US Army personnel.

MP FUNCTIONS IN ASSOCIATION WITH INTERROGATION OPERATIONS

5-57. MP and MI personnel both have responsibilities with regard to EPW/detainees, but with different goals and responsibilities. (See DOD Directive 3115.09.) Therefore, close coordination must occur between MP and MI personnel in order to facilitate the effective accomplishment of the MP and MI missions. Both MP and MI personnel must ensure that they treat detainees in accordance with the baseline standards of humane treatment.

5-58. MPs are responsible for the humane treatment, evacuation, custody and control (reception, processing, administration, internment, and safety) of detainees; force protection; and the operation of the internment facility, under the supervision of the provost marshal. The MPs do not conduct intelligence interrogations. Intelligence interrogation is strictly a HUMINT function. DOD policy requires that all detainees in its control, whether or not interrogation has commenced, are assigned an internment serial number as soon as possible, normally within 14 days of capture. (See AR 190-8.)

5-59. The standard MP security and internment functions are the only involvement the MPs have in the interrogation process. MPs will not take any actions to set conditions for interrogations (for example, "softening up" a detainee). For purposes of interrogation, military working dogs will not be used.

5-60. MPs may support interrogators as requested for detainee custody, control, escort, and/or additional security (for example, for combative detainees). When interrogators promise an incentive to a detainee, the interrogators must coordinate with the MPs to ensure that the detainee receives the incentive and is allowed to retain it. MPs may provide incentives in support of interrogation operations under the following conditions:

- Using incentives is coordinated with and approved by the MP facility commander.
- Providing and withdrawing incentives does not affect the baseline standards of humane treatment. This means that MPs can provide incentives such as special food items. However, when the incentive is withdrawn, the MPs still must provide the normal rations.
- Using incentives does not violate detainee custody and control or facility security. This means that if a HUMINT collector requests MPs to provide an incentive (for instance, specialty food) but the detainee has been spitting on the guards, then MPs would not provide the incentive because it might reinforce inappropriate behavior.

5-61. MPs exercise the overall responsibility for the safety of detainees, even in those cases in which detainees are in the temporary custody of HUMINT collectors or other agency personnel for the purpose of interrogation. HUMINT collectors should arrange with the MP supervisor to debrief MP guards. Guards who observe and interact with detainees can report the detainees' disposition, activities, mood, and other observable characteristics.

5-62. HUMINT collectors conduct interrogations for intelligence information. They normally work within the confines of the detainee detention facility, but have no involvement in the mission of the security of detainees. MPs follow a strict protocol concerning access to detainees. Accompanied and unaccompanied access to detainees must be coordinated and approved in advance by the MP commander responsible for the detainees or that commander's designated representative.

5-63. When HUMINT collectors coordinate for a detainee interrogation in an internment facility, the MPs escort the detainee to the interrogation site, which is collocated with, or located within the internment facility. MPs verify that the HUMINT collector is authorized access to the detainee. Depending on security concerns, the HUMINT collector may request that the MP remain, or he may request the MP depart until the detainee needs to be returned to the living area. If the MP remains, his functions are to maintain the security, accountability, and safety of the detainee and the safety of the interrogator, interpreter, and others in the interrogation site. The MP will perform no role in the interrogation. When conducting interrogations in a holding area such as a detainee collection point (DCP), MPs may not be available to provide security for interrogation operations. In that case, the

HUMINT collector will need to arrange for security from the unit that has established the holding area.

5-64. If the MP departs the immediate area where the detainee is being questioned (for example, asked to wait outside the interrogation room), the HUMINT collector will assume custody and responsibility for the detainee by signing for the detainee, noting the detainee's physical condition.

5-65. SOPs should be written to comply with a requirement that interrogation operations will always be under observation, whether conducted in fixed sites, holding areas, or in the field. Physical setup and logistical availability will dictate whether observation is conducted directly, from a concealed location, or by video monitoring. HUMINT collectors should never be alone with a detainee without being under observation.

5-66. Once a HUMINT collector has assumed custody of a detainee, he will not turn the detainee over to anyone other than an MP. Specifically, he will not allow another government agency to assume custody from him. The HUMINT collector will instead return the detainee to the custody of the MP, and the agency seeking custody of the detainee will then be required to do so from the MP. Likewise, HUMINT collectors will not assume custody of a detainee directly from another government agency, but will require them to return the detainee directly to the custody of the MP.

LEGAL, REGULATORY, AND POLICY PRINCIPLES AND GUIDELINES

5-67. The GPW (Appendix A, Section I), the GC (Appendix A, Section III), and the UCMJ are relevant documents pertaining to interrogations of detainees.

5-68. The approaches, psychological techniques, and other principles presented in this manual must be conducted in accordance with applicable law and policy. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs. US policy is to treat all detainees and conduct all interrogations, wherever they may occur, in a manner consistent with this commitment. Authority for conducting interrogations of personnel detained by military forces rests primarily upon the traditional concept that the commander may use all available resources and lawful means to accomplish the mission and to protect and secure the unit.

"Prisoners of war do not belong to the power for which they have fought; they are all under the safeguard of honor and generosity of the nation that has disarmed them."

—Napoleon, The Military Maxims of Napoleon 1927, ed. Burnod

POINT OF CAPTURE THROUGH EVACUATION

MP Functions	HUMINT Functions
• Maneuver and Mobility Support Operations • Area Security • Internment and Resettlement Operations • Law and Order Operations • Police Intelligence Operations • Ensure detainee abuse is avoided and reported	• Screen and question detainees at TCPs and checkpoints • Question contacts, local civilians, refugees, and EPWs • Conduct liaison with military and civilian agencies • Report information obtained • Ensure detainee abuse is avoided and reported • Support DOCEX

DETENTION FACILITY

MP Functions	HUMINT Functions
• Detain and guard EPWs, civilian internees, and other detainees • Conduct reception and processing • Coordinate Classes I, II, and VIII supplies • Coordinate NGOs, PVOs, and interagency visits • Ensure detainee abuse is avoided and reported • Transport detainees within the detention facility to interrogation area • Maintain security during interrogation operations	• Debrief guards • Screen detainees and EPWs for PIR and IR • Provide linguist support when possible • Observe detainees under MP control • Ensure detainee abuse is avoided and reported • Conduct interrogations • Report information obtained • Cross-cue other intelligence disciplines (as needed) • Support DOCEX

Figure 5-1. MP vs HUMINT Responsibilities.

5-69. The Geneva Conventions establish specific standards for humane care and treatment of enemy personnel captured, retained, or detained by US military forces and its allies. All persons who have knowledge of suspected or alleged violations of the Geneva Conventions are obligated by regulation to report such matters through command channels or to designated individuals, such as the SJA or IG. For example, HUMINT collectors who are working with others must ensure that no incidents of detainee abuse occur, whether committed by a fellow HUMINT collector, an interpreter, HN or coalition personnel, MP, representative of another government agency, or anyone else.

5-70. Failure to report a suspected or alleged violation of the law of war may subject the service member to disciplinary actions. Violations of the Geneva Conventions committed by US personnel may constitute violations of the UCMJ. The commander is responsible for ensuring that the forces under his command comply with the Geneva Conventions. If violations occur in the conduct of warfare, the commander bears primary responsibility for investigating and taking appropriate action with respect to the violators.

5-71. Every soldier has the duty to report serious incidents, whether observed or suspected, in accordance with AR 190-40. Such incidents are reported to the chain of command. If the chain of command itself is

implicated, the soldier can report the incident to the SJA, IG, chaplain, or provost marshal.

5-72. There are reasons for reporting serious incidents beyond those related to legal requirements. For instance, the publishing of enemy war crimes can be used to influence public opinion against the enemy. Also, reporting war crimes of other countries provides important information that may become relevant, since we would not be able to transfer detainees to any power that we could not rely on to treat them appropriately under the law of war, including the Geneva Conventions.

5-73. Several articles of the GPW apply to HUMINT collectors and interrogation operations. Excerpts from some of the most relevant articles of the Geneva Conventions are listed below. Although the following excerpts are specific to EPWs, service members must treat all detainees captured during armed conflict consistent with the provisions of the GPW unless a determination to the contrary is made. Moreover, US policy requires that US forces apply the principles of the Geneva Conventions, during military operations. (See Appendix A.)

- Article 5 - Should any doubt arise as to whether persons having committed a belligerent act and having fallen into the hands of the enemy, belong to any of the categories enumerated in Article 4, such persons shall enjoy the protection of the present Convention until such time as their status has been determined by a competent tribunal.
- Article 13 - PWs must at all times be treated humanely. Any unlawful act or omission by the Detaining Power causing death or seriously endangering the health of a PW in its custody is prohibited. Likewise, PWs must at all times be protected, particularly against acts of violence or intimidation and against insults and public curiosity.
- Article 14 - PWs are entitled, in all circumstances, to respect for their persons and honor. Women shall be treated with all regard due to their sex, and shall in all cases benefit by treatment as favorable as that granted to men.
- Article 15 - The Power detaining PWs shall be bound to provide, free of charge, for their maintenance and medical attention required by their state of health.
- Article 17 - This article covers several requirements with direct impact on interrogation.
  - Every PW, when questioned on the subject, is bound to give only his surname, first names and rank, date of birth, and army, regimental, personal or serial number, or failing this, equivalent information. If he willfully infringes this rule, he may render himself liable to a restriction of the privileges (emphasis added) accorded to his rank or status.
  - For example, this does not mean if a prisoner fails to give this information he loses status as a prisoner, only special privileges. An example might be an officer who fails to identify himself as such. An officer cannot be compelled to work (Article 49). An officer who fails to identify himself as such could lose this privilege.

  - The questioning of PWs shall be carried out in a language they understand.
  - No physical or mental torture or any other form of coercion may be inflicted on EPWs to secure from them information of any kind whatever. PWs who refuse to answer may not be threatened, insulted, or exposed to unpleasant or disadvantageous treatment of any kind.
- Article 18 - All effects and articles of personal use, except arms, horses, military equipment and documents, shall remain in the possession of PWs, likewise their metal helmets and protective masks and like articles issued for personal protection. Effects and articles used for their clothing or feeding shall also remain in their possession, even if such effects and articles belong to their regulation military equipment.
  - Badges of rank and nationality, decorations and articles having above all a personal or sentimental value may not be taken from PWs.
  - Sums of money carried by PWs may not be taken away from them except by order of an officer, and after the amount and particulars of the owner have been recorded in a special register and an itemized receipt has been given, legibly inscribed with the name, rank, and unit of the person issuing said receipt. (Note: Unit SOP should require initial impounding of all sums of money from detainees, properly documented and accounted for, in order to prevent detainees from using money to buy influence of any kind, or participate in black market or other improper activity.)
- Article 19 - PWs shall be evacuated, as soon as possible after their capture, to camps situated in an area far enough from the combat zone for them to be out of danger. Only those PWs, who, owing to wounds and sickness, would run greater risks by being evacuated than by remaining where they are, may be temporarily kept back in a danger zone.
- Article 33 - Medical personnel and chaplains, while retained by the Detaining Power with a view to assisting PWs, shall not be considered as PWs. They shall, however, receive as a minimum, the benefits and protection of the Geneva Convention. They shall continue to exercise their medical and spiritual functions for the benefits of PWs.

5-74. **All captured or detained personnel, regardless of status, shall be treated humanely, and in accordance with the Detainee Treatment Act of 2005 and DOD Directive 2310.1E, "Department of Defense Detainee Program," and no person in the custody or under the control of DOD, regardless of nationality or physical location, shall be subject to torture or cruel, inhuman, or degrading treatment or punishment, in accordance with and as defined in US law.** All intelligence interrogations, debriefings, or tactical questioning to gain intelligence from captured or detained personnel shall be conducted in accordance with applicable law and policy. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E,

"The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs. Use of torture is not only illegal but also it is a poor technique that yields unreliable results, may damage subsequent collection efforts, and can induce the source to say what he thinks the HUMINT collector wants to hear. Use of torture can also have many possible negative consequences at national and international levels.

Cruel, Inhuman or Degrading Treatment Prohibited

All prisoners and detainees, regardless of status, will be treated humanely. Cruel, inhuman and degrading treatment is prohibited. The Detainee Treatment Act of 2005 defines "cruel, inhuman or degrading treatment" as the cruel unusual, and inhumane treatment or punishment prohibited by the Fifth, Eighth, and Fourteenth Amendments to the U.S. Constitution. This definition refers to an extensive body of law developed by the courts of the United States to determine when, under various circumstances, treatment of individuals would be inconsistent with American constitutional standards related to concepts of dignity, civilization, humanity, decency and fundamental fairness. All DOD procedures for treatment of prisoners and detainees have been reviewed and are consistent with these standards, as well as our obligations under international law as interpreted by the United States.[1]

Questions about applications not resolved in the field by reference to DOD publications, must be forwarded to higher headquarters for legal review and specific approval by the appropriate authority before application.

The following actions will not be approved and cannot be condoned in any circumstances: forcing an individual to perform or simulate sexual acts or to pose in a sexual manner; exposing an individual to outrageously lewd and sexually provocative behavior; intentionally damaging or destroying an individual's religious articles.

[1] Nothing in this enclosure should be understood to affect the U.S. obligations under the law of war.

5-75. **If used in conjunction with intelligence interrogations, prohibited actions include, but are not limited to—**

- Forcing the detainee to be naked, perform sexual acts, or pose in a sexual manner.
- Placing hoods or sacks over the head of a detainee; using duct tape over the eyes.
- Applying beatings, electric shock, burns, or other forms of physical pain.
- "Waterboarding."
- Using military working dogs.
- Inducing hypothermia or heat injury.
- Conducting mock executions.
- Depriving the detainee of necessary food, water, or medical care.

5-76. While using legitimate interrogation techniques, certain applications of approaches and techniques may approach the line between permissible actions and prohibited actions. It may often be difficult to determine where

permissible actions end and prohibited actions begin. In attempting to determine if a contemplated approach or technique should be considered prohibited, and therefore should not be included in an interrogation plan, consider these two tests before submitting the plan for approval:

- If the proposed approach technique were used by the enemy against one of your fellow soldiers, would you believe the soldier had been abused?
- Could your conduct in carrying out the proposed technique violate a law or regulation? Keep in mind that even if you personally would not consider your actions to constitute abuse, the law may be more restrictive.

5-77. If you answer yes to either of these tests, the contemplated action should not be conducted. If the HUMINT collector has any doubt that an interrogation approach contained in an approved interrogation plan is consistent with applicable law, or if he believes that he is being told to use an illegal technique, the HUMINT collector should seek immediate guidance from the chain of command and consult with the SJA to obtain a legal review of the proposed approach or technique. (See paras 5-80 and 5-81 for information on responding to illegal orders.) If the HUMINT collector believes that an interrogation approach or technique is unlawful during the interrogation of a detainee, the HUMINT collector must stop the interrogation immediately and contact the chain of command for additional guidance.

CAUTION: Although no single comprehensive source defines impermissible coercion, certain acts are clearly prohibited. Certain prohibited physical coercion may be obvious, such as physically abusing the subject of the screening or interrogation. Other forms of impermissible coercion may be more subtle, and may include threats to turn the individual over to others to be abused; subjecting the individual to impermissible humiliating or degrading treatment; implying harm to the individual or his property. Other prohibited actions include implying a deprivation of applicable protections guaranteed by law because of a failure to cooperate; threatening to separate parents from their children; or forcing a protected person to guide US forces in a dangerous area. Where there is doubt, you should consult your supervisor or servicing judge advocate.

5-78. Security internees are detainees who are not combatants but who pose a security threat, may be under investigation, or who pose a threat to US forces if released. HUMINT collectors are required to treat all detainees humanely. EPWs are entitled to additional protections guaranteed by the GPW that security internees may not be eligible for. For example, allowing a security internee to communicate with a family member (a right that an EPW has under the Geneva Conventions) could allow him to pass information that would compromise a sensitive investigation and endanger the lives of soldiers and civilians. HUMINT collectors should consult with their SJA for clarification of detainees' status and rights.

5-79. HUMINT collectors are employed below brigade level when the combat situation requires limited tactical interrogation at battalion or lower.

HUMINT collectors should also provide training in the area of tactical questioning to designated S2 personnel. The potential for abuse of the detainee is greatest at initial capture and tactical questioning phase. With the excitement and stress of the battlefield, unskilled personnel may exercise poor judgment or be careless and thus resort to illegal techniques to elicit critical information. Personnel who are not trained HUMINT collectors will not attempt to use approach techniques. Instructions must stress the importance of the proper treatment of detainees. Emphasize that in addition to legal requirements, the abuse of a detainee at the initial stage of contact often renders future interrogation futile. All treatment of detainees must be consistent with the Geneva Conventions. (See ST 2-91.6 for further information on tactical questioning.)

5-80. Orders given to treat detainees in any way that violate the Law of War, including the Geneva Conventions, or that result in detainees being treated in any prohibited manner are unlawful. Every soldier must know how to respond to orders that he perceives to be unlawful. If a soldier receives an order that he knows to be unlawful, or that a person of ordinary sense and understanding would know to be unlawful, or if the order is not clear enough to determine if it is legal or not, he should follow the steps set out below (preferably in the order listed):

- Ask for clarification.
- State that the order is illegal if he knows that it is.
- Use moral arguments against the order.
- State the intent to report the act.
- Ask the senior interrogator to stop the act.
- Report the incident or order if the order is not withdrawn or the act in question is committed.
- If there appears to be no other recourse, refuse to obey the unlawful order.

NOTE: If the order is a lawful order, it should be obeyed. Failure to obey a lawful order is an offense under the UCMJ.

5-81. None of the above actions should be taken in the presence of any detainee. Witnessing actions taken to determine the legality of an order may lead to increased resistance of the detainee and could lead to increased resistance throughout the detainee population if they believe they are being treated unlawfully.

5-82. Illegal orders or incidents must be reported to the chain of command. However, if the chain of command itself is implicated, report the incident or order to the SJA, IG, chaplain, or provost marshal.

OPERATIONAL CONSIDERATIONS AND REQUIREMENTS

EPW Evacuation System

5-83. The MPs are responsible for evacuating detainees, civilian internees, and other detainees, as stipulated in AR 190-8. HUMINT collection assets must be placed to take advantage of the evacuation system the MPs will put into place. The evacuation of detainees and civilian internees normally is a slow and cumbersome process that can severely tax a maneuver unit's resources. Appendix D explains the handling of detainees in detail, including the 5Ss—Search, Silence, Safeguard, Segregate, and Speed to the Rear. The 5Ss are authorized with respect to handling detainees for the purposes of movement of detainees and security. The 5Ss are not authorized for use as interrogation approach techniques.

5-84. The initial evacuation of detainees and civilian internees is the responsibility of the capturing unit. That unit is normally responsible for moving the detainees and civilian internees from the point of capture to the nearest DCP. Under MP doctrine, the MPs are responsible for the detention, security, processing, safety, well-being, accountability, and humane treatment of detainees and civilian internees.

5-85. Normally the MPs assume responsibility for the further evacuation of the detainees and civilian internees; however, under certain circumstances, other units could be charged with this task. The detainees are normally evacuated from a DCP to a short-term collection facility and then finally to a theater internment facility. Once the theater internment facility (joint) is established, dependent on METT-TC factors, the internment facility escort guard units may go forward as far as the initial collection points and escort detainees and civilian internees to a short-term collection facility or straight to a theater internment facility.

5-86. Senior MP commanders coordinate and synchronize transportation and security requirements with MP divisional and BCT leaders. It may take 8 hours for a detainee to reach the DCP; 8 to 16 hours more to reach a short-term collection facility; and 24 additional hours to reach the theater internment facility. Mandatory timelines will be determined in command policy guidance. Critical during this process is that MPs work closely with MI, SJA, and interagency personnel to determine the proper status of individuals detained. Determining whether an individual is an EPW, a criminal insurgent, or in another status is crucial to facilitate the release or transportation, holding, and security requirements. This determination will be used when the individual's biometric data is taken and entered into the Biometric Automated Toolset (BAT).

5-87. The HUMINT collection assets need to be positioned to maximize their collection potential and take advantage of the time available during evacuation. The rapidity of operations and the need to facilitate the commander's situational understanding—coupled with the technological innovations that link the HUMINT collector to databases, analysts, and technical support from anywhere on the battlefield—require placing the HCTs forward into brigade and even maneuver battalion areas to provide

immediate access to EPWs/detainees. EPWs/detainees are normally interrogated for tactical information in the maneuver battalion trains areas and then questioned in detail at the theater JIDC.

Security

5-88. When dealing with detainees, the HUMINT collector faces two security considerations: his own physical security and information security. Particularly when operating in support of tactical operations, the HUMINT collector is in close contact with enemy soldiers who could attempt to escape and may attack the HUMINT collector in doing so. Detainees during a stability and reconstruction operation are often people committed to a cause who find themselves in desperate circumstances. Although the detainees are normally under guard, the HUMINT collector must always be alert to any physical threat posed by these individuals. He must also ensure that his own actions do not provide the detainee with the means with which to harm the collector or anyone else.

5-89. The HUMINT collector should also be aware that EPWs and other detainees may attempt to elicit information. Since HUMINT collectors, by virtue of their position, may possess a great deal of classified information, they must be careful not to reveal it unwittingly in the process of questioning a detainee.

PROHIBITION AGAINST USE OF FORCE

Acts of violence or intimidation, including physical or mental torture, or exposure to inhumane treatment as a means of or aid to interrogation are expressly prohibited. Acts in violation of these prohibitions may be a violation of US law and regulation and the law of war, including the Geneva Conventions of 1949, and may be criminal acts punishable under the UCMJ and other US law. Moreover, information obtained by the use of these prohibited means is of questionable value. If there is doubt as to the legality of a proposed form of interrogation, the advice of the SJA must be sought before using the method in question.

Limitations on the use of methods identified herein as expressly prohibited should not be confused with psychological ploys, verbal trickery, or other nonviolent or non-coercive subterfuge used by the trained HUMINT collector in the successful interrogation of hesitant or uncooperative sources. Use of torture by US personnel would bring discredit upon the US and its armed forces while undermining domestic and international support for the war effort. It also could place US and allied personnel in enemy hands at a greater risk of abuse by their captors. Conversely, knowing the enemy has abused US and allied POWs does not justify using methods of interrogation specifically prohibited by law, treaty, agreement, and policy. In conducting intelligence interrogations, the J2/G2/S2 has primary staff responsibility to ensure that these activities are performed in accordance with these laws and regulations. **[*The commander bears the responsibility to ensure that these activities are performed in accordance with applicable law, regulations, and policy. The unit must have an internal SOP for execution of the interrogation mission.]**

The psychological techniques and principles in this manual should neither be confused with, nor construed to be synonymous with, unauthorized techniques such as brainwashing, physical or mental torture, including drugs that may induce lasting or permanent mental alteration or damage. Physical or mental torture and coercion revolve around eliminating the source's free will, and are expressly prohibited by GWS, Article 13; GPW, Articles 13 and 17; and GC, Articles 31 and 32.

> *Torture is an act committed by a person under the color of law specifically intended to inflict severe physical or mental pain and suffering (other than pain or suffering incidental to lawful sanctions) upon another person within his custody or physical control. (Extracted from Title 18 of the United States Code, Section 2340A).*

*Emphasis added for use in this manual.

Capture Rates

5-90. Anticipating not only overall capture rates but also capture rates linked to specific operations is vital to the correct placement of HUMINT collectors supporting interrogation operations. Defensive and stability and reconstructions operations normally provide a small but steady flow of detainees while successful offensive operations can overwhelm HCTs. To be successful, HUMINT collection support to tactical operations must be carefully planned and prioritized. Available HUMINT collection assets must be balanced against the operations objective, enemy situation estimate, and projected EPW capture rates. The unit S2 is responsible for projecting capture rates.

Interrogating Wounded and Injured Detainees

5-91. Commanders are responsible to ensure that detainees receive adequate health care. Decisions regarding appropriate medical treatment of detainees and the sequence and timing of that treatment are the province of medical personnel. Detainees will be checked periodically in accordance with

command health care directives, guidance, and SOPs, applicable to all detainees to ensure they are fit for interrogations. Detainees determined by medical personnel to be medically unfit to undergo interrogation will not be interrogated. Health care personnel will be on call should a medical emergency arise during interrogation. Health care personnel will report detainees' conditions, as appropriate, to the commander. Health care providers shall not be placed in a position to advise on the application or duration of interrogation approach techniques.

5-92. Wounded and otherwise injured detainees can be a valuable source of information. For evacuation purposes, medical personnel may classify detainees as walking wounded or sick or as non-walking wounded or sick. Walking wounded detainees are evacuated through normal evacuation channels. Non-walking wounded are delivered to the nearest medical aid station and evacuated through medical channels.

5-93. HUMINT collectors may interrogate a wounded or injured detainee provided that they obtain permission from a competent medical authority and that the questioning will not delay or hinder medical treatment. Questioning will not delay the administration of medication to reduce pain or the evacuation of the detainee to where they may receive medical treatment, nor will interrogation be allowed if it would cause a worsening of the condition of the detainee. In most cases, this simply requires the HUMINT collector to ask the doctor, medic, or other medical personnel if it is all right to talk to the detainee.

5-94. With the doctor's permission, the HUMINT collector may talk to the detainee before, after, or during medical treatment. The HUMINT collector cannot at any time represent himself as being a doctor or any other type of medical personnel. Nor can he state, imply, or otherwise give the impression that any type of medical treatment is conditional on the detainee's cooperation in answering questions.

TYPES OF INTERROGATION OPERATIONS

5-95. There are two general categories of interrogation operations: **field interrogation operations** and **interrogation facility operations**.

FIELD INTERROGATION OPERATIONS

5-96. Field interrogation operations constitute the vast majority of interrogation operations at echelons corps and below. Field interrogations include all interrogation operations not conducted at a fixed facility. Current doctrine emphasizes the placement of HCTs forward with maneuver units to provide immediate interrogation support while the information is fresh and the detainee may still be susceptible to approaches, due to the shock of capture. The rationale for this method of employment is twofold:

- First, the pace of the modern battlefield no longer allows the luxury of waiting for a detainee to reach a collection point prior to interrogation. Commanders need more timely information, including HUMINT. Also, automated tools and improved communications now permit rapid transmittal of information from forward-deployed HCTs.

- Second, current MP doctrine has the theater level EPW escort companies picking up detainees as far forward as the division forward collection points and bypassing the intervening collection points.

5-97. An added benefit of placing the HCTs with maneuver units is that it allows them to conduct other HUMINT collection activities, such as the debriefing of local civilians and refugees concurrently with interrogation operations. HCTs are allocated to maneuver units based on—

- The relative importance of that subordinate element's operations to the unit's overall scheme of maneuver.
- The potential for that subordinate element to capture detainees, documents, and materiel or encounter civilians on the battlefield.
- The criticality of information obtained from those sources to the success of the parent unit's overall OPLANs.

5-98. As the mission and situation change, the HCTs are redistributed. As MI assets, they should never be kept in reserve.

5-99. During offensive and defensive operations, HCTs normally operate with maneuver brigades and battalions. HUMINT collectors with battalions or brigades should be equipped with vehicles and communications systems that are compatible with the systems organic to the supported unit. HUMINT collectors with brigades and battalions receive their collection priorities from the S2 of the supported unit. In stability and reconstruction operations, the HCTs normally operate in the AOs of battalion and brigade TFs.

INTERROGATION FACILITY OPERATIONS

5-100. Joint interrogation operations are operations conducted at higher echelons, usually at, and in coordination with, EPW and detainee internment facilities. The Joint Forces Commander (JFC) normally tasks the Army component commander to establish, secure, and maintain the EPW internment facility system. The corps may have the mission of establishing an interrogation facility when it is acting as the Army Forces (ARFOR) or Land Component Command (LCC) element.

5-101. An echelon above corps (EAC) MP brigade normally operates the theater internment facility. The subordinate JFC with a J2 staff lead establishes a Joint Interrogation and Debriefing Center as an activity within the theater internment facility. The MI Brigade Commander or other named SIO is normally designated as the JIDC commander. Army interrogation operations are normally carried out in an area of the MP-operated internment facility set aside for that use.

5-102. The JIDC is normally administratively and operationally self-sufficient. A JIDC will function as part of an overall detainee command and control structure as outlined in FM 3-19.40 and/or by policy. Continuous coordination between the JIDC commander and internment facility commander is essential. The JIDC will—

- Normally consist of facility headquarters, operations, analysis, editorial, interrogation, screening, and DOCEX elements.

- Collocate with the theater detainee internment facility.
- Organizationally structure itself to meet METT-TC requirements within the theater.
- Include HUMINT collectors, CI personnel, technical experts, personnel for CEDs and DOCEX, and intelligence analysts, as applicable, from the Army, Air Force, Marine Corps, Navy, and other government agencies.
- Maintain the capability to deploy HCTs forward, as needed, to conduct interrogations or debriefings of sources of interest who cannot be readily evacuated to the JIDC.
- Often establish a combined interrogation facility with allied HUMINT collector or interrogator augmentation if operating as part of a multinational operation.
- Receive collection guidance from the C/J/G2X and send its intelligence reports to the C/J/G2X and to the supported C/J/G/S2.

5-103. The exact size and organizational structure of these elements will vary dependent on METT-TC.

Headquarters Element

5-104. The activity headquarters provides all command, administrative, logistic, and maintenance support to the JIDC. It coordinates with—

- Higher headquarters for personnel, intelligence, and operational and logistical support prior to and after deployment.
- Theater J2 for reporting procedures, operational situation updates, theater and national level intelligence requirements, and collection priorities.
- Provost marshal for location of theater detainee internment facilities and for procedures to be followed by HUMINT collectors and MPs for the processing, interrogating, and internment of EPWs.
- Commanders of theater medical support units and internment facility for procedures to treat, and clear for questioning, wounded EPWs.
- Commanders of supporting CI and TECHINT assets to establish support requirements and procedures.
- The servicing SJA.
- Magistrate for Article 78 issues.
- Commanders of Air Force, Marine, Navy, and national level organizations to arrange administrative and logistic interoperability.

Operations Element

5-105. The operations element controls the daily activities within the JIDC. The JIDC operations element—

- Ensures that work areas are available for all JIDC elements.
- Establishes and maintains JIDC functional files, logs, and journals.
- Makes detainee files available to detainee release boards to assist the board members in their determinations.
- Establishes interrogation priorities.

- Disseminates incoming and outgoing distribution.
- Conducts coordination with local officials, adjacent and subordinate intelligence activities, CI, MP, PSYOP, the Joint Captured Materiel Exploitation Center (JCMEC), Plans and Policy Directorate (J5), and provost marshal.
- Conducts coordination with holding area officer in charge (OIC) for screening site, medical support, access, movement, and evacuation procedures for detainees.
- Conducts operations briefings when required.
- Supervises all JIDC operations and establishes SOPs.
- Supervises all intelligence collection activities within the JIDC.
- Ensures observers are present when OGAs use the JIDC's interrogation rooms.

Analytical Element

5-106. The analytical element normally is directly subordinate to the operations element. The JIDC analytical element ensures that collection requirements are current and validated. It reviews reports to ensure that the information reported is in response to validated collection requirements. In addition, they ensure an up-to-date common operational picture (COP) by maintaining digital mapping of the current tactical situation and with OB updates to help HUMINT collectors maintain their situational awareness. At locations where digital mapping is not possible, paper situation maps (SITMAPs) are maintained. This element also—

- Obtains, updates, and maintains the database.
- Works with interrogators to provide collection focus for interrogations.
- Establishes and maintains OB workbooks and files including data generated by intelligence information which has not been verified.
- Maintains digital or paper SITMAPs, as available, displaying enemy and friendly situations.
- Catalogs, cross-references, and disseminates collection requirements to JIDC collection elements.
- Reviews interrogation reports for inclusion into the database.
- Conducts situation briefings when required.
- Conducts intelligence reach with the J2 analytical cell and other analytical elements, such as INSCOM Information Dominance Center, for relevant information and analysis.

Editorial Element

5-107. The editorial element is normally directly subordinate to the operations element. It reviews all outgoing reports for format, content, and completeness.

DOCEX Element

5-108. At a minimum, the JIDC will contain a small DOCEX element to translate, screen, and extract information from and report on information of

intelligence interest from source-associated documents. The theater joint document exploitation facility (JDEF) may be collocated with the JIDC. In this instance, the JDEF will translate, screen, categorize, and exploit all types of CEDs.

Screening Element

5-109. The JIDC normally has a separate screening element to receive and screen all incoming detainees and their personal effects. The screening element will review previous screening reports, which should have been sent along with the detainees; recommend priorities for interrogation; identify individuals of interest to other agencies; and may conduct limited interrogations for PIR information. The exact size of the element will vary based on detainee capture rates and detainee flow. Interrogation elements should use their most experienced interrogators as screeners in order to quickly and effectively select the detainees for interrogation who are most likely to possess useful information.

Interrogation Element

5-110. The interrogation element assigns HUMINT collectors to specific detainees, uses interrogation and other HUMINT collection methods to obtain information in response to intelligence requirements, and produces intelligence reports (IIRs and SALUTE reports) as well as source-related operational reports. The interrogation element may also debrief returning US POWs and other personnel as deemed relevant.

This page intentionally left blank.

PART THREE

The HUMINT Collection Process

Part Three discusses the logical progression of phases involved in all HUMINT collection. There are five phases and the related task of screening that are critical to HUMINT collection. This remains consistent with previous doctrine as captured in the interrogation process but adds screening as a phase and combines approach and termination. The five phases are screening, planning and preparation, approach and termination strategies, questioning, and reporting.

Chapter 6

Screening

6-1. Available human sources and documents almost always exceed the qualified HUMINT collection assets and resources that can be applied against them. Screening facilitates the efficient application of these limited assets and resources to maximize the collection of relevant information.

HUMAN SOURCE SCREENING

6-2. As it applies to HUMINT operations, screening is the process of evaluating and selecting human sources and documents for the prioritized collection of information based on the collection requirements and mission of the unit conducting the screening or its higher headquarters. Screening categorizes and prioritizes sources based on the probability of a particular source having priority information and the level of cooperation of the source. Screening is also used to determine if a source matches certain criteria that indicate that the source should be referred to another agency. Screening is conducted at all echelons of command and in all operational environments. There are two general categories of screening: human source screening and document screening. Human source screening will be explained in depth in this chapter. Document screening is explained in Appendix I.

6-3. The resources (time and personnel) allocated to screening must be balanced against those required for interrogations, debriefings, and other collection methodologies. Although screening is not in itself an information collection technique, it is vital to the rapid collection of information. Through screening, the effectiveness of limited collection assets can be maximized by targeting those assets against the sources with the highest potential of providing key information. Screening requires experienced individuals with

maturity and judgment who are totally knowledgeable of the collection requirements and able to make well-reasoned decisions based on limited information. Collection (interrogation, debriefing, and elicitation) can be integrated into screening activities; however, it slows the screening process and decreases the number of potential sources that can be screened.

6-4. Human source screening is the evaluation of an individual or a group of individuals to determine their potential to answer collection requirements or to identify individuals who match a predetermined source profile. The purpose of screening is to—

- Identify those select individuals among the target audience who have information of potential value and who are willing or can be persuaded to cooperate.
- Identify individuals who match certain criteria that indicate them as being potential subjects for source operations or matching the profile for collection by special interest groups such as TECHINT or CI.

6-5. Screening requires the development of criteria that are indicators of potential information. These might include rank, position, gender, ethnic group, appearance, and location.

6-6. Screening is an integral part to all HUMINT collection operations. While questioning an individual source, a HUMINT collector may switch between screening (finding out general source areas of knowledge) to interrogation, debriefing, or elicitation (finding out detailed information about a specific topic). In operations, such as EPW or refugee operations that involve large numbers of potential sources, screening will normally be conducted as a separate but collocated operation as part of the overall interrogation or debriefing effort. The high number of potential sources being dealt with in most human source screening operations requires a systematic approach be developed and utilized to make the most effective use of the personnel and resources being allocated to the source screening operation.

SCREENING OPERATIONS

6-7. Like all intelligence operations, human source screening operations are focused on certain targets. Although the exact target population group will depend on the requirements of the theater of operations, the target focus of source screening operations is best described as the permanent and transitory population in the AO. This definition includes local indigenous populations, refugees, and travelers in the area, and detainees (including EPWs). Specifically excluded from this definition are members of the HN forces (military and paramilitary), members of allied forces, and members of HN government agencies who are available to US forces through liaison operations. Other personnel not indigenous to the AO (such as legitimate NGOs, humanitarian organizations, UN personnel) are available to US forces for voluntary debriefing and should be excluded from screening operations.

6-8. Screening operations may be conducted in a variety of situations and are dependent on the operational situation and the population. Although every source screening operation has the same basic purpose, each can be directed against different segments of the population in different locations throughout

the AO. In order to accommodate the differences in the screening audience and location, different types of source screening operations are employed.

- Tactical Screening. Tactical screening is conducted in support of combat or contingency operations. It can include the screening of EPWs or detainees at the point of capture, the screening of refugees, or the screening of local civilians in cordon and search. At the tactical level, there is no time for elaborate approach techniques so the degree of cooperation becomes a prime concern. Tactical area screening is characterized by rapidly changing requirements, the need to evacuate noncombatants and detainees to a secure area, and the need to collect priority tactical information while operations are in progress. Although the most lucrative type of source is often the detainee, all available sources should be screened for priority tactical information. In tactical screening, the HUMINT collector normally accompanies the maneuver force (OPCON or DS). If the HUMINT collector establishes that the source has information of value during screening, he immediately questions the source. Information collected is passed to the maneuver commander, normally via SALUTE reports. The HUMINT collector may recommend to the commander that individual sources be further detained for additional questioning. Screening must be done accurately in order that a commander can make a decision to detain or release possibly hostile personnel, based on the recommendation of a HUMINT collector.
- Checkpoint Screening. Checkpoints are often established to screen the local populations as they transit through and within the AO or to screen large numbers of individuals such as refugees or DPs as they enter the AO. Screening checkpoints can be static or mobile. HUMINT collectors must pay particular attention to refugees leaving the area ahead of friendly forces (AO or AOI). It is likely that refugees can provide information of tactical value more quickly and easily than detainees. Refugees know the area and may be able to identify for the collector anything that is out of the ordinary, such as insurgent or terrorist activities.
- Local Population Screening. This refers to the screening of the local population within their own neighborhoods. When HUMINT collectors move into a new area, they must observe the local population and determine who may be able and willing to provide the information they have been tasked to collect. Once this determination is made, the collectors must engage those individuals in conversation to assess their level of knowledge.
- Collection Facility Screening. Screening is conducted as a normal part of HUMINT collection operations at collection facilities such as theater interrogation and debriefing facilities and refugee camps. Screening is coordinated with the unit, normally an MP unit that is responsible for the operation of the facility.
- Local Employee Screening. CI personnel periodically screen local employees to determine possible security risks. Concurrently, local employee screening may identify sources who can provide information to answer the CCIRs. Close coordination between HUMINT and CI collection assets is a must in local employee screening.

- Variations and Combinations. All types of screening can be adapted to meet specific circumstances slightly different from those for which they were designed. Additionally, it is possible to use more than one type of screening in an operation if the specific circumstances require it.

6-9. Screening of refugees, EPWs, and other detainees normally occurs at two locations: initially at the point where friendly forces first encounter them and again when they arrive at the theater and other holding areas or refugee camps. The capturing or detaining forces should enforce segregation of EPWs from refugees and other detained civilians; they should be screened in separate operations, one screening for EPWs and one for refugees and other detained civilians. Depending on METT-TC factors, segregation should be conducted as follows:

- Refugees: Refugees, even if of the same nationality as the enemy, are not treated as enemies exclusively based on their nationality and are not automatically subject to control measures. If refugees are encountered on the battlefield, they are segregated from EPWs and screened separately. They are generally not detained further unless some additional reason requires their detention. At a refugee camp, screening will be done in coordination with the NGO operating the refugee camp. If there is a reason to detain refugees for further questioning for intelligence purposes, or because they pose a security threat, they will then be treated as a detainee. Under all circumstances, refugees will be treated humanely. If they are transported to an internment facility, they will be in-processed by MPs and their Geneva Conventions status will be determined. Their status under the Geneva Conventions will afford them certain privileges.
- EPWs: Officers are segregated from enlisted. The enlisted are divided into NCOs and lower enlisted. Males are segregated from females. This segregation facilitates rapid screening for EPWs who may have information to answer PIRs and IRs as well as prohibits officers from influencing enlisted personnel to resist questioning.
- Other Detainees: Civilians should be screened separately from EPWs. As with refugees, if there is a reason to detain civilians for further questioning for intelligence purposes, or because they pose a security threat, they will then be treated as a detainee. Whether or not civilian detainees are released or detained further, screeners should ensure that the civilian detainees are treated humanely. If the civilian detainees are transported to an internment facility, they will be in-processed by MPs and their Geneva Conventions status will be determined. Once detainees are in-processed into an internment facility, they are then considered to be civilian internees and their status as such will afford them certain privileges under the Geneva Conventions.

SCREENING AT FORWARD LOCATIONS

6-10. The initial screening and subsequent questioning should be accomplished as far forward as is operationally expedient. If a HUMINT collector is not available, the unit S2 must ensure initial screening and questioning of sources are completed by qualified personnel. At this level, the individual (military or civilian) is questioned for job, unit (if applicable),

mission, PIR and IR, and supporting information (JUMPS). If time allows, the HUMINT collector may collect additional information, such as the source's name, to start a formal source file to preclude duplication at higher echelons. S2s and personnel other than HUMINT collectors should not attempt an approach at this stage.

6-11. HUMINT collectors will only use approach techniques as time and circumstance allow. The prime requirement is to identify the individuals with information of immediate tactical value, to collect that information expediently, and to evacuate the source. In this case, tactical questioning is normally integrated seamlessly into the screening process. This initial screening can also be used to identify individuals for immediate evacuation to a higher echelon facility for detailed questioning. Any screening reports or information reports generated at this level must accompany the EPWs or detainees as they are evacuated. Typically, battlefield screening reports, such as the screening sheet shown in Figure 6-1, will be done on paper in order to allow multiple screeners to work simultaneously. If automation support is available for each screener, an electronic version of the screening report is used, or the "KB Easy" (Figure 10-2), which allows the screener to easily put screening information into a DIA report format and transmit it electronically. (See Chapter 10 for a KB-EZ worksheet.)

6-12. US forces capturing enemy forces or detaining civilians on the battlefield search each individual for weapons, documents, or other material of intelligence interest. Each individual receives a Capture Tag which records basic biographic data such as name, rank, serial number, unit of assignment (military), location of capture, and any special circumstances concerning the capture. (See Appendices E and F.) Each document or item removed from the captive is also "bagged and tagged" to identify from whom it was taken. This initial step is vital, as properly processing captives and their equipment greatly simplifies the screening process. All documents associated with the source and any possessions taken from him must be evacuated with the source, but not on his person. This is to ensure that the next echelon of screeners and interrogators will have the ability to exploit these items for intelligence value, or to support determination of approach strategies.

SCREENING AT REFUGEE CAMPS OR DETENTION FACILITIES

6-13. When a detainee or refugee arrives at an internment facility, refugee camp, or similar facility, a more extensive screening is conducted. The screening sheet is used to facilitate this process. This screening is normally done in conjunction with in-processing into the facility. During in-processing, the MP will assign an Internment Serial Number (ISN) that is registered with the Theater Detainee Reporting Center (TDRC). The ISN will be used to track the detainee throughout the MP detention system. The ISN should not be used in intelligence channels; however, HUMINT collectors should record the ISN on the screening sheet to aid in locating the detainee again. For intelligence reporting purposes, HUMINT collectors will assign the detainee a source reporting number that will be used to identify the detainee and information associated with him, regardless of whether or not the detainee is transported to another facility. The J2 issues source reporting numbers to HUMINT collectors through the OMT.

SAMPLE

Figure 6-1. Screening Sheet.

6-14. When a detainee is in-processed into an internment facility, MPs will assign the detainee's status as an EPW, retained person, protected person, or other status under the Geneva Conventions. Figure 6-2 provides excerpts from FMI 3-19.40 on MP internment and resettlement operations. In an international conflict, individuals entitled to POW status (EPWs) include—

- Members of the regular armed forces.
- Other militias or volunteer corps, and organized resistance movements of a State Party to a conflict, provided they meet each of the following criteria:
  - Commanded by a person responsible for his subordinates.
  - Having a fixed distinctive sign recognizable at a distance.
  - Carrying arms openly.
  - Conducting operations in accordance with the law of war.
- Civilians who accompany the force.
- Crew members of the merchant marine and crews of civilian aircraft of a State Party to the conflict, who do not benefit by more favorable treatment under any other provisions of international law.

6-15. There are other categories specified in Article 4, GPW. Questions with respect to an individual's entitlement to EPW status should be directed to your SJA.

6-16. Retained personnel (see Articles 24 and 26, GWS):

- Official medical personnel of the armed forces exclusively engaged in the search for, or the collection, transport or treatment of wounded or sick, or in the prevention of disease, and staff exclusively engaged in the administration of medical units and facilities.
- Chaplains attached to the armed forces.
- Staff of National Red Cross Societies and that of other Volunteer Aid Societies, duly recognized and authorized by their governments to assist Medical Service personnel of their own armed forces, provided they are exclusively engaged in the search for, or the collection, transport or treatment of wounded or sick, or in the prevention of disease, and provided that the staff of such societies are subject to military laws and regulations.

6-17. Protected persons include civilians entitled to protection under the GC, including those we retain in the course of a conflict, no matter what the reason. A "civilian internee" is a person detained or interned in the United States or in occupied territory for security reasons, or for protection, or because they have committed an offense against the detaining power, and who is entitled to "protected person" status under the GC.

6-18. The term "detainee" may also refer to enemy combatants. In general, an enemy combatant is a person engaged in hostilities against the United States or its coalition partners during an armed conflict. The term "enemy combatant" includes both "lawful enemy combatants" and "unlawful enemy combatants."

- **Lawful enemy combatants:** Lawful enemy combatants, who are entitled to protections under the Geneva Conventions, include members of the regular armed forces of a State Party to the conflict;

militia, volunteer corps, and organized resistance movements belonging to a State Party to the conflict, which are under responsible command, wear a fixed distinctive sign recognizable at a distance, carry their arms openly, and abide by the laws of war; and, members of regular armed forces who profess allegiance to a government or an authority not recognized by the detaining power.

- **Unlawful enemy combatants:** Unlawful enemy combatants are persons not entitled to combatant immunity, who engage in acts against the United States or its coalition partners in violation of the laws and customs of war during armed conflict. For purposes of the war on terrorism, the term "unlawful enemy combatant" is defined to include, but is not limited to, an individual who is or was part of supporting Taliban or al Qaida forces, or associated forces that are engaged in hostilities against the United States or its coalition partners.

Excerpts from FMI 3-19.40, Military Police Internment/Resettlement Operations

ACTIVITIES

The MPs assist MI screeners by identifying captives who may have answers that support PIR and IR. Because MPs are in constant contact with captives, they see how certain captives respond to orders and see the types of requests they make. The MPs ensure that searches requested by MI personnel are conducted out of sight of other captives and that guards conduct same-gender searches.

The MI screeners examine captured documents, equipment and, in some cases, personal papers (journals, diaries, and letters from home). They are looking for information that identifies a captive and his organization, mission, and personal background (family, knowledge, and experience). Knowledge of a captive's physical and emotional status or other information helps screeners determine his willingness to cooperate.

LOCATION

Consider the following when planning an MI screening site:

- The site is located where screeners can observe captives as they are segregated and processed. It is shielded from the direct view of captives and is far enough away that captives cannot overhear screeners' conversations.
- The site has an operation, administrative, and interrogation area. The interrogation area accommodates an interrogator, a captive, a guard, and an interpreter as well as furniture. Lights are available for night operations.
- Procedures are implemented to verify that sick and wounded captives have been treated and released by authorized medical personnel.
- Guards are available and procedures are implemented for escorting captives to the interrogation site.
- Procedures are published to inform screeners who will be moved and when they will be moved.
- Accountability procedures are implemented and required forms are available.

Figure 6-2. MP Support to Screening.

6-19. It may not be immediately evident in a particular theater of operation whether an individual is an unlawful enemy combatant or is associated with or supporting the unlawful enemy combatants of the United States. Consult your J/G/S2 and servicing SJA for information relevant to your theater of operations.

6-20. All captured or detained personnel, regardless of status, shall be treated humanely, and in accordance with the Detainee Treatment Act of 2005 and DOD Directive 2310.1E, "Department of Defense Detainee Program", and no person in the custody or under the control of DOD, regardless of nationality or physical location, shall be subject to torture or cruel, inhuman, or degrading treatment or punishment, in accordance with and as defined in US law. (See Appendix A, GPW Articles 3, 4, 5, 13, and 14.)

6-21. The rights of EPWs are stated in the GPW. They include the right to quarters, rations, clothing, hygiene and medical attention, property, and other rights. EPWs may not renounce their rights to renounce EPW status. (See Appendix A, GPW Article 7, Section I.)

6-22. Retained personnel must receive at least the same benefits as EPWs. They may only be required to perform religious or medical duties, and they may only be retained as long as required for the health and spiritual needs of the EPWs. Retained persons must be returned to their home country when no longer needed.

6-23. Protected persons' rights include protection from physical or moral coercion and from being taken hostage. Protected persons are protected from murder, torture, corporal punishment, mutilation, medical experimentation, and any form of brutality. Protected persons rights are limited, though. They do not have the right to leave captivity and are not immune from prosecution. Protected persons can be screened and identified for intelligence purposes.

SCREENING PROCESS

6-24. At the internment facility, the screening process normally is distinct from the questioning (interrogation or debriefing) process. Dependent on the criticality of the information identified, the source may be questioned immediately for relevant information but will more likely be identified for future questioning. The screening is a more formal process in which the screener attempts to obtain basic biographic data, areas of general knowledge, source cooperation, and vulnerability to select approach techniques in addition to identifying knowledge of critical intelligence tasks. Once the screener has established the basics (source identification, cooperation, and knowledge), he normally passes the source on to the personnel that conduct the questioning. The screener will complete a screening report that will be forwarded in accordance with unit SOPs (see Chapter 10). If a detainee's knowledge is of Joint Forces interest, a knowledgeability brief (KB) should be written and submitted electronically. (A short form KB worksheet is shown at Figure 10-2.) Complete guidance on KBs is contained in DIAM 58-12 (S//NF).

6-25. If the source freely discusses information of PIR value, the screener normally exploits the information fully and completes a SALUTE report. (See Appendices H and I.) If the source's knowledge of PIR information is extensive and he is freely giving the information, the senior screener and the OIC or noncommissioned officer in charge (NCOIC) of the interrogation or debriefing element are notified immediately. They decide if the screener should continue questioning the source or if the source should be handed off to another HUMINT collector. If source-associated documents contain PIR information, the collector will exploit them as fully as possible and write a SALUTE report. (See Appendix H.)

6-26. The source normally is assigned a standard screening code. The screening code is an alphanumeric designation that reflects the level of cooperation expected from the source and the level of knowledgeability the source may possess. Table 6-1 shows the codes for assessing sources. Those sources assigned to the same category are interrogated in any order deemed appropriate by the interrogation or debriefing element.

Table 6-1. Source Screening Codes.

CODE	COOPERATION LEVEL
1	Responds to direct questions.
2	Responds hesitantly to questioning.
3	Does not respond to questioning.
	KNOWLEDGEABILITY LEVEL
A	Very likely to possess PIR information.
B	Might have IR information.
C	Does not appear to have pertinent information.

6-27. Figure 6-3 shows the order in which detainees in the assessed screening categories should be interrogated. Category 1-A sources normally should be the first priority to be questioned. Category 1-B and 2-A would be Priority II. Category 1-C, 2-B and 3-A would be next as Priority III sources, with 2-C, and 3-B being in the fourth group to be interrogated. Category 3-C sources are normally not questioned. This order ensures the highest probability of obtaining the greatest amount of relevant information within the available time. Screening codes may change with the echelon. The higher the echelon, the more time is available to conduct an approach. Appendix B discusses the reliability ratings of information obtained.

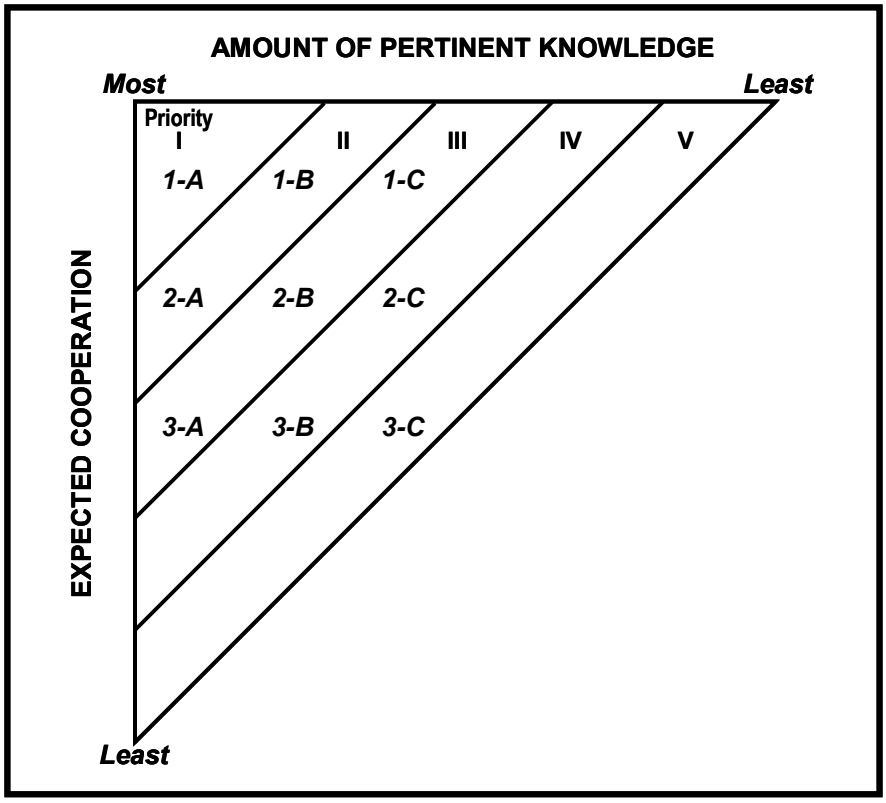

Figure 6-3. Interrogation Priorities by Screening Category.

SCREENING METHODOLOGIES

6-28. Depending on the specific operation or echelon, screening may be a separate operation or may be integrated into a specific collection mission. For example, a HUMINT collector accompanying a patrol encounters a civilian who may have information that is relevant to collection requirements. The HUMINT collector screens the source (that is, asks some general questions to determine the source's level of cooperation and knowledge). Upon receiving a positive response, the HUMINT collector may debrief the civilian on a specific topic or question him on areas of PIR interest. He then reverts to the screening role to determine other relevant knowledge. If the HUMINT collector determines through screening that the source either has no relevant information or cannot be persuaded to cooperate within an operationally expedient timeframe, he is not debriefed as part of the screening process. In detainee or refugee operations, a separate element will normally conduct all screenings. They establish a prioritized list of sources who are then systematically questioned on specific topics by other HUMINT collectors or other technical specialists.

SCREENING REQUIREMENTS

6-29. In addition to potential sources, screening requires several components.

- Collection Requirements. Without a clear list of specific collection requirements, screening becomes virtually impossible. The concept behind screening is to rapidly identify source knowledgeability as it relates to requirements. Screeners should obtain a copy of the supported element's collection requirements and become familiar with the intelligence indicators listed therein. Screeners must use their experience and imagination to devise ways to identify EPWs and detainees who might possess information pertinent to these indicators. Vague requirements (such as "What is the threat doing?") do not provide the focus necessary to make a source selection. The HUMINT collection element must break these SIRs into indicators if the supported intelligence officer has not already done this. The indicators must take into account the type of sources anticipated. For example, a refugee probably will not know if the threat intends to defend a particular ridgeline. However, he might know whether or not there are threat forces on the ridge, if an improvised explosive device (IED) is being employed on a route, if they are digging in, or if engineer type equipment is in the area.
- Selection Criteria. After reviewing the collection requirements, the HUMINT collection element will develop preliminary criteria to identify the source type that will most likely have the required information. The source type may include gender, appearance, military rank, age, or occupation. Some of these criteria are determined by visual observation, thereby saving time in not having to question everyone. Other criteria such as occupation or place of residence may require brief questions.
- Trained Screeners. Screening is possibly the most difficult HUMINT skill. A HUMINT collector must use his experience, questioning skill, cultural knowledge, and knowledge of human nature to decide in a matter of minutes or possibly seconds whether limited HUMINT collection assets and valuable time should be spent talking to an individual based on the way he looks and the answers to a few questions. A wrong decision will mean wasted assets and valuable information missed.
- Language Capability and Cultural Awareness. Screening involves more than asking a series of questions. The HUMINT collector must be able to evaluate the answers, the specific language used, and other clues such as body language to determine the value of an individual to the collection effort. This requires a mature and experienced screener. If the HUMINT collector does not possess the target language, he and his interpreter must be able to work together quickly with mutual trust and confidence.
- Area Conducive to Screening Operations. Effective screening operations must allow the HUMINT collector to speak to the source where the source is not exposed to outside influences or dangers that may inhibit his responses. For that reason, sources should never be screened within the sight or hearing of other potential sources.

HUMINT collectors can use rooms within a building, tents, or other field-expedient methods to isolate the individual being screened. Screening a source within view or hearing of other potential sources may not only pose a danger to the source but also will tend to inhibit the source from freely cooperating.

- Security. The personnel conducting the screening need to be able to concentrate on the individual being screened. Although the collector is ultimately responsible for his own personal security, screening is facilitated by having dedicated personnel present (for example, MPs) who are responsible for security. Screeners coordinate with MP or other security personnel concerning their role in the screening process.

INITIAL DATA AND OBSERVATIONS

6-30. Screening is a filtering process whereby, under ideal circumstances, all potential sources would be questioned to determine if they have information of intelligence interest. In actuality this is often impossible. Screeners often use visual and other aids to "prescreen" the sources in order to eliminate a substantial portion of the target population before conducting detailed screening. For example, if the HUMINT collector at a checkpoint is only interested in information concerning a specific denied geographic area, screeners may ask all refugees if they are from or have been in that denied area recently. A less experienced screener could do this allowing the experienced screener to conduct more extensive screening of the select target audience.

6-31. If time and circumstances permit, screeners should question any friendly personnel who have had extensive contact with the persons to be screened. In the case of detainees, this could include holding area personnel or personnel from the capturing unit. These personnel may be able to help identify sources that might answer the collection requirements or who might match a particular source profile.

6-32. Normally the screener will not have time to conduct any extended observation of the person to be screened; however, the screener should make a quick visual observation of the source prior to questioning him. He should note anything in the source's appearance and behavior that indicates he is willing to cooperate immediately or is unlikely to cooperate. The screener should also note any physical indicators that the source may have the type of information or belong to a certain source profile category.

6-33. Physical indicators include overall appearance such as rank, insignia, and condition of the uniform and type and condition of equipment for military sources and general type and condition of dress (for example, business suit as opposed to work clothes) for civilians. Certain physical indicators (dress, medals such as religious medals, physical type) may be indicators that the source belongs to a specific ethnic or religious group. The source's physical reactions may also indicate a willingness or lack of willingness to cooperate. For example, does the source move forward in the group or attempt to hide within the group; does he intentionally place himself in the wrong segregation group; or does he show any overt signs of nervousness, anxiety, or fright?

6-34. The screeners will also examine all documents and possessions found on the source (if any) and all documents pertaining to the source (if any). **At a minimum, a detainee should have a properly filled out capture tag, which will indicate to the screener where the detainee was captured, by which unit, and under what circumstance.** (See para 6-12 and Appendix D.) Documents such as personal letters, orders, rosters, signal operating instructions (SOIs) and map sections can provide information that identify the source, his organization, mission, and other personal background information (family, knowledge, experience, education). They may in themselves provide information, may identify a source for questioning, and may provide information helpful in assessing a source's susceptibility to an approach.

6-35. Documents pertaining to the source, beginning at the point of capture throughout the evacuation process, such as previous screening and intelligence reports and administrative documents (such as source personnel records prepared by the MPs) help the screener by providing information concerning the source's physical status, emotional status, level of knowledge, level of experience, and other background data. Making timely use of reports from lower echelons can be difficult for the screener, especially when dealing with large numbers of potential sources.

SOURCE ASSESSMENT

6-36. Screeners use standard reporting formats to identify the results of their screening (see Chapter 10). The determination must be made as to whether the source is of any intelligence value to the HUMINT collector. The HUMINT collector will basically place the source within one of four categories.

- Of Immediate Intelligence Interest. This category includes personnel who are assessed, based upon the screening process, who possess information in response to requirements. They are interrogated or debriefed (dependent on their status) to retrieve relevant information. This questioning may be conducted by the same person conducting the screening or by another HUMINT collector.
- Of Interest to Other Agencies. In most cases, the HUMINT collector will be provided with collection requirements by other agencies or disciplines such as TECHINT or CI. In this case the HUMINT collector will question the source on these requirements and report the information appropriately. However, in some instances, particularly in the case of CI, the HUMINT collector may be given a list of topics or a profile of personnel who are of interest to CI. The HUMINT collector will notify the local CI representative when a person matching the "CI profile" is identified. After the HUMINT collector has extracted any relevant intelligence information, he will "pass" the individual off to the CI agents. In many cases, particularly with individuals of TECHINT or other specialized interest, the HUMINT collector will be asked to conduct the questioning with the technical support of the individual from the interested agency. This is coordinated through the HUMINT collector's OMT and the chain of command.

- Of Potential Interest as a Contact Source. On occasion, especially during stability and reconstruction operations, the HUMINT collector may identify an individual who has the potential to provide information in the future, due to his placement or access. Although the individual may not have information of immediate interest, the HUMINT collector will pass his recommendation to the appropriate office, normally the C/J/G/S2X, provided that source operations are authorized (see Chapter 5).
- Of No Interest. This category includes sources who prove (based upon the screening process) to be of no interest to the HUMINT collector or other agencies. Their biographic data is recorded, but they are not questioned further. This category will likely include the bulk of individuals screened. Individuals who have been screened are kept separated from those who have not yet been screened.

OTHER TYPES OF SCREENING OPERATIONS

LOCAL EMPLOYEE SCREENING

6-37. CI personnel conduct local employee screening, primarily to identify individuals who may be a security risk. HUMINT collectors also can use local employee screening as a means to obtain intelligence information or to identify personnel with placement and access to answer information requirements. Employee screening must be conducted in a secure environment and out of the hearing and sight of other employees. Formal written reports of the screening must be maintained.

LOCAL COMMUNITY OR AREA SCREENING

6-38. Local area screening is normally done in coordination with other operations such as a cordon and search operation. The HUMINT collectors accompany the forces conducting the operation and screen the general population to identify individuals of intelligence or CI interest.

SCREENING FOR CI REQUIREMENTS

6-39. Before initiating the screening process, the HUMINT collector establishes liaison with supporting CI agents. The CI element provides CI requirements and provides a profile of personnel of CI interest. CI is normally interested in personnel who—

- Have no identification documents.
- Have excessive or modified identification documents.
- Possess unexplainable large amounts of cash or valuables.
- Are illegal border-crossers.
- Attempt to avoid checkpoints.
- Are on the CI personalities list, which includes members of an intelligence service.
- Request to see CI personnel.
- Have family in the denied area.
- Speak a different language or dialect than is spoken in the area.

6-40. Personnel of CI interest include two general categories of people: The first type of "person of interest" is any individual or group involved in adversary intelligence collection operations or who is attempting to enter the AO to conduct such operations. Examples of these individuals include but are not limited to—

- Known or suspected members and/or supporters of foreign intelligence and security services and known or suspected members and/or supporters of the intelligence activities of non-state entities such as organized crime, terrorist groups, and drug traffickers.
- Known or suspected hostile espionage agents, saboteurs, subversives, or hostile political figures.
- Known or suspected enemy collaborators and sympathizers who may pose a security threat to US forces.
- Personnel known to have engaged in intelligence, CI, security, police, or political indoctrination activities.
- Known or suspected officials of enemy governments whose presence poses a security threat to US forces.
- Political leaders known or suspected to be hostile to the military and political objectives of the US or an allied nation.

6-41. The second type of "person of CI interest" is any individual who possesses information concerning the identification, location, or activities of personnel in the first category.

SCREENING FOR OTHER TECHNICAL COLLECTION REQUIREMENTS

6-42. Other technical areas such as TECHINT, SIGINT, IMINT, MASINT, or other services need to supply the HUMINT collectors with a profile of the individuals with whom they wish to speak. The HUMINT collectors upon identifying such an individual will contact the requesting agency after extracting PIR information.

Chapter 7

Planning and Preparation

7-1. Planning and preparation is one of the five phases of HUMINT collection. HUMINT collection, regardless of the methodology employed, must be a systematic, carefully prepared enterprise. The HUMINT collector engages in general preparation throughout his career. He focuses that preparation to a specific area of the world, specific mission, and specific collection requirements as those become available. Finally, the HUMINT collector focuses his planning and preparation on a specific collection effort with a specific source.

COLLECTION OBJECTIVES

7-2. Each HUMINT collection mission is conducted for a definite purpose. The HUMINT collector must keep this purpose firmly in mind as he proceeds to obtain usable information to satisfy the requirements, and thus contributes to the success of the unit's mission. The HUMINT collector must use the objective as a basis for planning and conducting questioning. The HUMINT collector should not concentrate on the objective to the extent he overlooks or fails to recognize and exploit other valuable information extracted from the source. For example, during HUMINT collection, the HUMINT collector learns of the presence of a heretofore unknown, highly destructive weapon. Although this information may not be in line with his specific objective, the HUMINT collector must develop this important lead to obtain all possible information concerning this weapon.

RESEARCH

7-3. The key to good HUMINT collection is preparation on the part of the collector. The HUMINT collector must understand the environment and particularly its human component, the mission of the supported unit, that unit’s intelligence requirements, his source, and the cultural environment. The ultimate success of a questioning session is often decided before the HUMINT collector even meets the source.

GENERAL RESEARCH

7-4. Due to the quickly changing world circumstances, it is impossible to conduct all the specific research required immediately prior to questioning a source. General research should be completed before entering an AO and continues until operation completion. Areas of research include but are not limited to—

- OPLANs and OPORDs. The HUMINT collector must be familiar with the unit OPLAN and that of its higher headquarters. By thoroughly understanding the unit OPLAN and OPORD, the HUMINT collector

and HUMINT commanders and leaders can anticipate collection requirements, develop source profiles, recommend deployment strategies, and otherwise integrate HUMINT operations into the overall unit operation. Although the OPORD needs to be read and understood in its entirety, certain areas are of critical importance to the HUMINT collection effort. They include—

- Task organization. This will show where HUMINT C2, staff support, and collection assets will fit into the organizational structure.
- Situation. This gives the friendly and enemy situation.
- Mission. This gives the HUMINT collectors insight into how their operations will integrate into the parent unit's operation.
- Execution. The four execution subparagraphs explain the commander's intent on how the mission is to be carried out:
  - Subparagraph 3a (Concept of Operation) includes how subordinate units' operations will be included in the overall plan.
  - Subparagraph 3a(3) (Reconnaissance and Surveillance) details how HUMINT collection operations will integrate into the overall ISR plan. Additional information on ISR is found in Annex L.
  - Subparagraph 3a(4) (Intelligence), along with Annex A (Task Organization) and Annex B (Intelligence), explains how the Intelligence BOS will support the scheme of maneuver.
  - Subparagraph 3d (Coordinating Instructions) lists the CCIRs and initial PIRs.

- Current events. The HUMINT collector must be knowledgeable about current events in all potential operational areas, especially those events that indicate the populace's feelings or intentions toward the US. This will facilitate a better understanding of the cultural, political, and socio-economic conditions that could influence the attitude and behavior of a source. This knowledge can be obtained and updated through classified periodic intelligence publications and/or military or civilian open sources, including both print and broadcast media, CA and PSYOP databases, and the J/G/S2 analytical elements.
- SOPs. The HUMINT collector must be familiar not only with his own unit's SOP but also with that of any supported unit. The HUMINT collector will be able to obtain specific information about report numbers and formats, as well as information about distribution channels for reports from these SOPs. The SOP will also explain unit policy on source exploitation and evacuation procedures, logistic and maintenance functions, and other C2 and support issues.
- Umbrella concept. The TF commander through the J/G2 and J/G2X issues an umbrella concept for HUMINT operations. When operating under this concept, collection parameters will be established in writing, and it is imperative that the HUMINT collector understands his role. Types of sources will be outlined concerning placement, motivation, and access. The umbrella concept will also specify the types of information against which the HUMINT collector can collect. The umbrella concept is governed by AR 381-100 (S//NF), AR 381-172 (S//NF), DIAM 58-11 (S//NF), and DIAM 58-12 (S//NF).

- Legal guides, SOFAs, operations and execute orders, ROE, and other legal and administrative requirements. The HUMINT collector must be thoroughly familiar with all documents that may set the legal parameters for his collection operations. These are available through the chain of command and from the SJA office. He must know how these requirements apply and to what type of sources each is applied.
- Collection requirements. The HUMINT collector needs not only to know but also to understand the requirements that he will be attempting to answer. These requirements can include CCIRs (PIRs and IRs), essential elements of friendly information (EEFIs), Intelligence Priorities for Strategic Planning (IPSP), specific requests from national level consumers such as HUMINT collection requirements (HCRs), SDRs, or even vocal orders given by the local commander. These all will determine the objective of the questioning plan.
- Databases. Intelligence databases can give the HUMINT collector detailed information about the source's unit, its organization, and its capabilities. They also have information on personalities. The HUMINT collector will use information obtained from databases to control the source and assess his answers for truthfulness. They will also give the HUMINT collector ideas of other areas to research. For example, if the threat is primarily a lightly armed insurgent force, studying similar organizations will provide the HUMINT collector with valuable insights into the possible methods of operation of the current target organization.
- SITMAP and COP. The current situation, both friendly and enemy, is vital for the movement of the HCT and for its collection operations. It reflects enemy unit identification, disposition, and boundaries; major roads or trails for movement of personnel, equipment, weapons; and locations of artillery, minefields, roadblocks, entrenchments, obstacles, staging areas, NBC contaminated areas, and ground surveillance devices. All of this information can be used in source questioning as control questions or in otherwise determining source veracity. The HUMINT collector will be able to identify indicators and predict what should be PIRs and IRs.
- INTSUM. The INTSUM provides a summary of the intelligence situation covering a specific period as dictated by the commander. It is already analyzed intelligence.
- Intelligence estimate. The intelligence estimate is derived from the intelligence preparation of the battlefield (IPB). It is based on all available intelligence and considers everything of operational significance. It will help point out gaps in the intelligence database. It is from these gaps that requirements are derived. It will provide information on the mission, AO, weather, terrain, enemy situation, enemy capabilities, and conclusions. It will cover all of the standard OB topics.
- Weapons and equipment guides. Weapons and equipment guides can assist the HUMINT collector in becoming familiar with the type of equipment employed in the AO. Guides are available in hardcopy and softcopy.

- Area handbooks. These handbooks provide detailed information about a specific area of the world. They provide information on political, economic, sociological, cultural, military, biographic, transportation, and geographic topics. The CIA and other agencies publish area handbooks annually. The US Department of State website also has continuously updated information on trouble spots around the world.
- Previous HUMINT reporting. The HUMINT collector should familiarize himself with all previous relevant reporting from the AO. This will provide him with insight into current operations, the types of information collected, and may help identify information gaps.
- Photographs, maps, and other geospatial products. In conducting general research, the HUMINT collector should become familiar with the AOs. This not only will help identify specific areas of HUMINT collection potential but also will be invaluable in both the questioning of specific sources and the maneuver of the HCT.
- Subject matter experts (SMEs) and technical research. Before deploying to an AO or before supporting on a particular mission, the HUMINT collector may identify particular areas in which he lacks critical knowledge. For example, a HUMINT collector who has previously been operating in an area with a conventional enemy may be deployed to an area with an unconventional threat from irregular forces. Also, intelligence requirements may focus on equipment that is unfamiliar to the HUMINT collector. In order to prepare himself, the HUMINT collector contacts SMEs or analysts or uses technical materials to gain background information.
- Other reports. Intelligence agencies publish numerous reports and summaries that are readily available to the HUMINT collector.

CLOSED AND OPEN-SOURCE INFORMATION (USE OF REACH)

7-5. Reach is a process by which deployed military forces rapidly access information from, receive support from, and conduct collaboration and information sharing with other units and organizations (deployed in theater and from outside the theater) unconstrained by geographic proximity, echelon, or command. Intelligence support is established based on requirements that will help the commanders (regardless of echelon) make decisions. Reach can be accomplished in various ways. There is no requirement for all intelligence functional areas or echelons to use the same approach; hence, there is no common standard for all units to use. Each organization or section should develop its strategy on using the various intelligence reach components. Standard enabling tools will provide for easier access than ever before (for example, access to the INSCOM Information Dominance Center).

INTELLIGENCE REACH COMPONENTS

7-6. Intelligence reach requires the G2/S2 to develop a strategy on how best to support the unit's mission with intelligence reach capabilities. There are eight basic elements of the strategy:

- Push: Push occurs when the producers of intelligence or information are knowledgeable of the customer's requirements and are able to send the desired intelligence to the customer without further requests. Push is accomplished through the Joint Dissemination System (JDS) and/or the Automated Message Handling System (AMHS).
- Pull: Pull occurs when the customer is familiar enough with existing databases to be able to anticipate the location of the desired information. Pull is greatly enhanced through the use of portals and homepages with hyperlinks to the various categories of information available to the user. This requires the establishment of such a homepage at each echelon, thus enabling higher echelons to research and pull from lower databases and homepages.
- Database Access: Access to local, theater, DOD, non-DOD, and commercial databases allows analysts to leverage stored knowledge on topics ranging from basic demographics to OB information. A validated DIA Customer Number (acquired by the J2/G2/S2) in combination with SIPRNET and Joint Worldwide Intelligence Communications System (JWICS) connectivity establishes access to most of the databases online.
- Integrated Broadcast Services (IBS): IBS is an integrated, interactive dissemination system, focusing on tactical user's information requirements using a common message Data Element Dictionary (DED) and J-series family of message formats. The goal of IBS is to resolve the uncoordinated proliferation of "stovepiped" intelligence or information broadcasts by providing the tactical commander with integrated time-sensitive tactical information.
- Collaborative Tools: Collaborative tools are computer-based tools (groupware) that help individuals work together and share information. They allow for virtual on-line meetings and data sharing. As much as possible, collaborative tools should be emplaced with all necessary echelons and centers prior to deployment.
- Request for Information: Reach includes the ability of an intelligence officer at any level to request information that is beyond what is available at his location, using the Community On-Line Intelligence System for End Users and Managers (COLISEUM) System. Once an RFI is entered into the system every other user of that system can see it. Hence, an echelon several echelons above the actual requester can and often does become aware of the request and may, in fact, answer it. Reach is also provided through INSCOM's Information Dominance Center and other nodes at J2 and G2.
- Leveraging Collection Management: The collection and ISR management system is established to provide a mechanism for tasking and managing collection assets for required information. Analysts who are trained and familiar with the system and the various tasking procedures can leverage the system for refined information.

- Distributed Common Ground System-Army (DCGS-A): DCGS-A is the ISR fusion and processing system for the future, as part of the overarching DOD-directed DCGS-A surface system family of systems. It will bring national and joint ISR capabilities down to JTF level, corps and division levels and BCT level to provide leaders with NRT information and visualization of threat, weather, and terrain information and intelligence. DCGS-A consolidates the capabilities of the following current-force ground processing systems:
  - All-Source Analysis System (ASAS).
  - Counterintelligence and Human Intelligence (CI/HUMINT) Single-Source Workstation.
  - Tactical Exploitation System (TES).
  - Guardrail Information Node (GRIFN).
  - Guardrail Common Sensor (GRCS) Intelligence Processing Facility (IPF).
  - Prophet Control.
  - Joint STARS Common Ground Sensor (CGS).

7-7. For more information on Intelligence Reach, see FM 2-33.5/ST.

SOURCE-SPECIFIC RESEARCH

7-8. Source-specific research is done immediately prior to questioning the source. The HUMINT collector may have to respond spontaneously in the case of a walk-in source in tactical operations, or if the HUMINT collector has advanced warning as in the case of a planned meeting with a source, a long-term debriefing, or an invitational source. Areas of research include but are not limited to—

- Screening Reports, KBs, Other Reports: Reports about the source not only can provide specific information about the type of information the source can provide to answer specific collection requirements but also can give the HUMINT collector extensive background information about the source. This background information can give clues to information the source might possess and to possible approach techniques. Information contained in screening reports and KBs may provide insight into—
  - Geographic Area: This area may show information about the source's ethnic background, political affiliation, religion, and customs. Information can be obtained from databases, locally registered vital statistics, and residence registries.
  - Languages: Determining the languages and dialects spoken, written, and understood by a source can provide valuable insights into that source's geographic and ethnic or tribal background, education, and social status. This determination of languages and dialects can be facilitated by the use of "flash cards" specific to the battlefield.
  - Other Reports: This can include other reports collected from this source at other echelons or reports from other sources from the same unit or location as the source. It can also include reports or documents published by the ACE at your request.

  - Political Group: This area can provide information on the source's beliefs as well as provide information on political leaders and goals. Additionally, political affiliation can sometimes provide information about subversive groups and paramilitary ties. Knowing the goals of the political organization can also assist the HUMINT collector in choosing an approach or establishing rapport.
  - Religious Affiliation: The source's religious affiliation may provide insight into his motivation, moral strengths and weaknesses, and other motivational factors.
  - Technical Field: Having knowledge about the source's technical field can assist the HUMINT collector in deciding upon which questions to ask. It will also assist the HUMINT collector in verifying the source's truthfulness because the HUMINT collector will have an understanding of the source's specialty.
  - Employment: By researching the source's employment history, the HUMINT collector can discover other areas of information that the source may be able to provide.
  - Education: The source's education level and educational history can not only give the HUMINT collector insight into the possible information the source can provide but also provide insight into possible approach strategies.
  - Social Status: Knowledge of the source's social status may provide a clue to a good approach strategy because the source may be accustomed to a certain type of treatment. It may also provide a clue to biographical information that the source may be able to provide.
  - Criminal Records: Criminal records may also indicate possible approach strategies. Additionally, they may indicate which groups or organizations the source may have knowledge about.
- Documents and Other Media Captured on or in Immediate Association with a Detainee or Brought in by a Debriefing Source: Documents captured with or otherwise pertaining to the source may give the HUMINT collector information about the source, his unit, or his role within that unit. They may answer requirements or indicate knowledge of PIRs. Personal letters, for example, could be used during the approach phase. If a source comes in voluntarily and provides documents, they should be reviewed prior to debriefing the source.
- Photographs, Maps, and Other Geospatial Products: Maps and photographs of the area about which the source is being questioned can give the HUMINT collector an idea of where the source has been and in what kind of terrain he operated, which might indicate knowledge or use of certain tactics. If the HUMINT collector is not familiar with the area the source was in, the HUMINT collector should take some time to look over the map so he can more readily relate when the source mentions locations or dispositions. Aerial photographs show more detailed up-to-date information than maps. They will not normally be as readily available as maps. Maps and other geospatial products will also be needed for use in the map-tracking portion of an interrogation. The HUMINT collector should work with the ACE of the supported unit to obtain them for the AO.

- SMEs: There will be occasions when the HUMINT collector will talk to sources about subjects of which the HUMINT collector has no knowledge. In that case, the HUMINT collector will want to talk to personnel who are SMEs. Depending on the depth of knowledge that the source is expected to have and the time available to prepare, the HUMINT collector may arrange for a technical expert to support the questioning (see Chapter 9).
- Technical Manuals: There are various weapon and equipment identification guides available in hardcopy, softcopy, and off the Internet that can assist the HUMINT collector in identifying any equipment mentioned by the source.
- Source Physical and Mental Condition: HUMINT collectors should observe the source prior to questioning if possible and also talk to anyone available who has relevant information concerning the source. MP guards can be an especially valuable source of information based on source observation and should be debriefed periodically. This can prevent surprises at the onset of the questioning session and can help the HUMINT collector assess the source's physical and mental condition as well as provide insights to possible approaches.
- Databases: Collectors should review source information and reports contained in the various databases available to them. The CHATS system, BAT database, and other databases can provide collectors with source information and previous reporting.

HUMINT COLLECTION PLAN

7-9. After conducting appropriate research, the HUMINT collector working with an analyst, if available, develops a source-based collection plan. This is geared to the specific source that is going to be questioned. The amount of time spent in preparing this plan depends on the operational circumstances. This may range from a quick mental review by an experienced HUMINT collector in a tactical environment to a formal written plan submitted by a subordinate to a team leader. The source collection plan will vary from source to source. It will also vary with the conditions under which the source is questioned. It serves as a checklist to ensure that all steps necessary to prepare for questioning are conducted. Whether written or oral, the HUMINT collection plan should contain at least the following items:

- HUMINT collection requirements.
- Serial number of EPW/detainee to be questioned.
- Location and time for the questioning.
- Primary and alternate approaches.
- Questioning plan including topics to be covered and the planned sequence of these topics.
- Prepared questions for unfamiliar or highly technical topics.
- Method of recording and reporting information obtained.

OBJECTIVE

7-10. The HUMINT collector will first determine the objective of his questioning. The objective is the set of collection requirements that the HUMINT collector will attempt to satisfy during the questioning session. A number of circumstances including the intelligence requirements, the time available, and the source will set the objective. Determining the objective consists of three parts:

- Identify the intelligence requirements. The primary objective of any questioning session is to answer or confirm PIR or other collection requirements.
- Identify the subject: The HUMINT collector will want to consider the source; for example, who he is, what he may know. The HUMINT collector will also want to consider the legal and other restrictions based on the type of source (contact source, EPW, refugee, strategic). For a military source (EPW) this includes rank, position specialty, and unit of assignment. For a civilian source it includes job, placement and access, associations, area of residence, and employment.
- Identify the intelligence requirements that the source may be able to answer. The HUMINT collector cannot normally waste time "fishing" for information. He must determine based on screening, what collection requirements the source can answer. The HUMINT collector compares the information that he gathered through his general and source-specific research and compares it to his list of collection requirements. He compares that list to the identity of the source and refines the list including all requirements that the source can be expected to be able to answer. The HUMINT collector will approach those areas first while staying aware of leads into other collection topics.

LOCATION

7-11. In most cases, the location for the questioning will be determined by operational requirements. However, the HUMINT collector should ensure some basic requirements are met:

- Each questioning session should be conducted outside the hearing and view of third parties. Even in the case of a source meeting in a public place, the HUMINT collector should choose a location where they cannot be overheard and where their meeting will not arouse suspicion.
- The location should be in a place that has reasonable security for the HUMINT collector and the source. In contact operations, the risk cannot always be eliminated but the acceptable risk levels should be based on the expected intelligence gain. In combat operations, most questioning (interrogation, debriefing of civilians on the battlefield) will take place in forward combat areas, but it cannot be done if it increases the risk to the source. Safe evacuation of the sources has priority over questioning.
- The location should provide ready access to the chosen method of recording and reporting the information.

7-12. When conducting military source operations, the location of the questioning will have psychological effects on the source. The questioning location should be chosen and set up to correspond to the effect that the HUMINT collector wants to project and his planned approach techniques. For example, meeting in a social type situation such as a restaurant may place the source at ease. Meeting in an apartment projects informality while meeting in an office projects more formality. Meeting at the source's home normally places him at a psychological advantage, while meeting in the HUMINT collector's work area gives the collector a psychological edge. The HUMINT collector should consider the status and level of the source, security, the workspace available, furnishings, the amount of lighting provided, and the ability to heat or cool the room as needed.

TIME

7-13. Time to conduct questioning should be estimated based on the source, the type of information that the HUMINT collector expects to get, and the complexity of that information. Other considerations include expected evacuation times for sources in tactical situations, the number of other sources that need to be spoken to; and in contact operations, the estimated time that the HUMINT collector can meet with the source without increasing the risk.

7-14. The HUMINT collector must also consider the physical conditions of the source and himself. After extended operations, there may be a limit on how long either the HUMINT collector or source can concentrate on a given subject. Even if the HUMINT collector has an unlimited time period (such as at a joint interrogation and debriefing facility), he must break his questioning down into topical sessions to maximize effectiveness. Time is only an estimate and should be modified based on the circumstances. It may be extended, for example, if the source has a greater than expected amount of information, or critical information in unforeseen areas. The time may be curtailed if the HUMINT collector has met his requirements, the source does not possess the expected information, or a more valuable source is identified.

PRIMARY AND ALTERNATE APPROACHES

7-15. In most circumstances, if the HUMINT collector is meeting with the source for the first time, he should select at least two alternate approaches to use if the direct approach is unsuccessful (see Chapter 8). These approaches need to be based on the HUMINT collector's source-specific research, his general area research, knowledge of the current situation, and knowledge of human nature. There are four primary factors that must be considered when selecting tentative approaches:

- The source's mental and physical state. Is the source injured, angry, crying, arrogant, cocky, or frightened?
- The source's background. What is the source's age and level of military or civilian experience? Consider cultural, ethnic, and religious factors.
- The objective of the HUMINT collection. How valuable is the source's potential information? Is it beneficial to spend more effort convincing this source to talk?

- The HUMINT collector himself. What abilities does he have that can be brought into play? What weaknesses does he have that may interfere with the HUMINT collection? Are there social or ethnic barriers to communication? Can his personality adapt to the personality of the source?

7-16. If the HUMINT collector has a screening sheet or KB, he can use it to help select his approaches. After reviewing the information, the HUMINT collector will analyze the information for indicators of psychological and/or physical weakness that would make a source susceptible to a specific approach. The HUMINT collector also needs to consider his particular strengths and weaknesses in conducting specific approaches. He must consider what immediate incentives he may possibly need and ensure that they are available. Also, if incentives had been previously offered or promised, the collector needs to know if they were in fact provided. If the HUMINT collector has previously questioned the source, he must evaluate the approaches he used and decide if they need to be modified or if additional approach techniques will be needed (see Chapter 8.)

ADDITIONAL SUPPORT REQUIRED

7-17. The HUMINT collector must decide if he will need technical support to include interpreter support.

- Technical support. The HUMINT collector must decide if he will need additional support including analytical, technical, or interpreter support.
- Analytical or technical support. The HUMINT collector must decide if he has the analytical or technical capability to question a specific source. If not, he must decide what degree of support from advice to participation is required of the analyst or technical expert. Any request for analytical or technical support must be coordinated with the 2X. On rare occasions, it may be desirable for the HUMINT collector to seek polygraph support or support from a Behavioral Science Consultant (BSC). BSCs are authorized to make psychological assessments of the character, personality, social interactions, and other behavioral characteristics of interrogation subjects and advise HUMINT collectors of their assessments, as needed.
- Interpreter support. If the HUMINT collector does not speak the needed language or does not speak the needed language well enough to conduct questioning, an interpreter will be required. If the HUMINT collector will need an interpreter, the HUMINT collector will also have to consider the clearance needed to complete the questioning and the availability of the interpreter, as well as the extra time necessary to complete the questioning session. The HUMINT collector will also have to brief the interpreter on the method of interpretation and the HUMINT exploitation plan. Also, he should determine whether there are any cultural aspects associated with the interpreter that may enhance or detract from the success of the meet. (See Chapter 11 for detailed information on HUMINT collection using an interpreter.)

DEVELOP A QUESTIONING PLAN

7-18. The HUMINT collector must develop a plan that will guide his questioning of the source. This includes general topics to be exploited and the sequence in which they will be covered.

7-19. There are two general sequences used in questioning: topical and chronological.

- Topical questioning is used when time is a prime concern, when the source is believed to possess key information in a limited area, when the questioning is concerning a technical topic, or when the source has been talked to previously and this is a subsequent questioning to expand on earlier topics.
- Chronological questioning normally is used when the HUMINT collector is uncertain of the areas of source knowledge, when time is not a factor in questioning, during initial questioning when the source is believed to have knowledge on a large number of topics, and in friendly force mission debriefing.

7-20. A topical sequence is an outline of topics to be questioned in a selected sequence and is based on intelligence requirements or HCRs, as well as a specific source's potential to provide information pertinent to those requirements. The plan serves as a checklist for the HUMINT collector to ensure that all subjects pertinent to the collection objective are questioned in an efficient and organized manner. The HUMINT collector uses his estimate of the type and extent of knowledge possessed by the source to modify the basic topical sequence of questioning. He selects only those topics in which he believes the source has pertinent knowledge. In this way, the HUMINT collector refines his element's overall objective into a set of specific HUMINT collection subjects. In OB factors questioning in either a tactical or strategic setting, and across the full spectrum of operations, the topics covered include missions and the nine major OB factors:

- Composition.
- Strength.
- Dispositions.
- Tactics.
- Training.
- Combat effectiveness.
- Logistics.
- Electronic technical data.
- Miscellaneous.

7-21. See Appendix G for questioning quick reference examples of topics covered under the nine OB factors.

7-22. In strategic and operational debriefing operations the relevant HCR or SDR will guide the HUMINT collector. Regardless of which tasking document is referenced, the topical sequence is established by collection requirements, modified or sequenced, based on source knowledge and time.

7-23. The nine OB factors are not the only guideline that may be used by the HUMINT collector. If the collection objective is something other than a

military unit, many of the OB factors will not fit the collection plan. A helpful memory aid, in this case, is mission, identification, location, and organization (MILO). MILO gives a short, easily remembered structure for questioning nonmilitary or strategic topics. The MILO factors can be questioned in any order, but often the most logical sequence of MILO questioning is identification, organization, location, and mission. Many of the nine OB factors can also fit into the MILO format.

IDENTIFY MEANS OF RECORDING AND REPORTING

7-24. The HUMINT collector will want to decide upon a means of recording the information obtained through source questioning. If the HUMINT collector is planning to use a sound or video recorder, he will also have to consider the availability of the equipment and its positioning (see Chapter 9). Along with the method of recording the information, the HUMINT collector will have to decide on the means of reporting the information (see Chapter 10). Tapes of interrogations must be safeguarded in accordance with DOD Regulation 5200.1-R.

FINAL PREPARATIONS

7-25. After the source-specific questioning plan is developed, the HUMINT collector takes some final preparatory steps.

- Review plan. The HUMINT collector should always go over his collection plan with his supervisor. This review can be written or oral. In addition to the obvious requirements to keep the chain of command informed, this review helps identify any weaknesses in the plan and is a means to effect required coordination and support.
- Collect questioning support materials. The HUMINT collector will want to collect the various references and other guides that he will use to support his questioning. These materials may include source documents, maps, aerial photographs, imagery, OB data, extra lights, extra tables, drawing templates, graph paper, questioning guides, technical reference manuals, city plans and handbooks, and recording devices.
- Conduct required coordination. The HUMINT collector coordinates any support requirements including analytical, technical, or interpreter support, questioning location, ICFs, recording equipment, security, and transportation.
- Organize. The HUMINT collector organizes his materials in a logical manner that will complement his topical sequence. By being organized, the HUMINT collector will not waste time trying to locate the correct manual or guide. Additionally, the HUMINT collector will present a professional appearance to his source.
- Reconnoiter the questioning location. If the questioning location is to be somewhere other than the HUMINT collector's normal AO, such as a public restaurant, the HUMINT collector should conduct an unobtrusive reconnaissance of the site. If at all possible, this should be at the same time and day of the week as the planned meeting. This allows the HUMINT collector to assess the possible security problems

of the location, judge the traffic flow, and identify any other items that might affect the questioning. He can also judge where within the meeting site he can set up for maximum security and psychological advantage. He must be careful that in doing so he does not set up patterns of operation that will increase rather than decrease security problems.

- Set up questioning site. If the HUMINT collector has control over the site where the collection is being conducted, the last step in preparing is the actual setup of the questioning site. The HUMINT collector will want to decide on the placement of the furniture and lighting and where everyone will be seated and decide where he will place his technical support materials.
- Question guards. If the person to be questioned is a detainee, the HUMINT collector should arrange to question MP guards who have been in contact with the detainee to ascertain source behavior, attitude, and other useful information that guards may be able to provide.
- Check with medical personnel. If the detainee was injured or ill, ensure that he was treated by medical authorities and released for questioning.

7-26. The supervisor reviews each plan for legal considerations, appropriate goals in accordance with the collection objectives of the supported unit, and makes any changes he thinks are necessary. The supervisor ensures that contract interrogators are utilized in accordance with the scope of their contract and current policy. (See Appendix K.) After the plan is approved, the collection operation is executed. Prior to execution, the supervisor ensures mission brief back, rehearsal, and pre-combat inspections are conducted.

Chapter 8

Approach Techniques and Termination Strategies

8-1. Regardless of the type of operation, the initial impression that the HUMINT collector makes on the source and the approach he takes to gain the source's cooperation will have a lasting effect on the continuing relationship and the degree of success in collecting information. The approach used will vary based on the type of operation; the operational environment; the status of the source; the personality, position, and identity of the source; and the personality and experience level of the HUMINT collector and the time available.

8-2. The MPs will not take any actions to set conditions for interrogations (for example, "softening up" a detainee). Additionally, in accordance with DOD Directive 3115.09, military working dogs, contracted dogs, or any other dog in use by a government agency shall not be used as a part of an interrogation approach nor to harass, intimidate, threaten, or coerce a detainee for interrogation purposes. Leadership throughout the chain of command is responsible to ensure that HUMINT operations are in compliance with these governing regulations and guidelines, whether the HUMINT collection is to take place as part of HCT operations or in an internment facility.

8-3. The only authorized interrogation approaches and techniques are those authorized by and listed in this manual, in accordance with the Detainee Treatment Act of 2005. Two approaches, Mutt and Jeff and False Flag, require approval by the first O-6 in the interrogator's chain of command. The restricted interrogation technique "Separation" requires COCOM commander approval for use, and approval of each interrogation plan using "Separation" by the first General Officer/Flag Officer (GO/FO) in the chain of command. Coordination may also be required with the C/J/G2X, security, legal, or other personnel. Regardless of the coordination efforts required, use of all techniques at all locations must carefully comply with this manual and additional instructions contained in the latest DOD and COCOM policies.

NOTE: The word "source" will be used in this chapter to mean any person who is the objective of the HUMINT collector's approach, and is applicable in any collection situation unless otherwise noted in the text. This use of the term "source" is consistent with US Army Intelligence Center HUMINT collector training.

APPROACH PHASE

8-4. During the approach phase, the HUMINT collector establishes the conditions of control and rapport to facilitate information collection. The approach begins with initial contact between the source and the HUMINT collector. Extreme care is required since the success of the collection effort

hinges, to a large degree, on the early development of the source's willingness to communicate. Interrogators must have a deep understanding of the cultural norms, anomalies, and emotional triggers of the person being interrogated in order to select appropriate approach strategies and to interrogate effectively.

8-5. The HUMINT collector's objective during this phase is to establish a relationship with the source that results in the source providing accurate and reliable information in response to the HUMINT collector's questions. The HUMINT collector adopts an appropriate persona based on his appraisal of the source but remains alert for verbal and non-verbal clues that indicate the need for a change in the approach techniques. The amount of time spent on this phase will depend mostly on the probable quantity and value of information the source possesses, the availability of other sources with knowledge on the same topics, and available time. At the initial contact, a businesslike relationship should be maintained. As the source assumes a cooperative attitude, a more relaxed atmosphere may be advantageous. The HUMINT collector must carefully determine which of the various approach techniques to employ.

8-6. Sources will cooperate with the HUMINT collector for various reasons ranging from patriotic duty to personal gain, such as material gifts or money. They may also respond to emotion or logic. Regardless of the type of source and his outward personality, every source possesses exploitable characteristics that, if recognized by the HUMINT collector, can be used to facilitate the collection process. These characteristics may be readily apparent or may have to be extrapolated from the source's speech, mannerisms, facial expressions, physical movements, involuntary responses (perspiration, changes in breathing, eye movement), and other overt indications that vary from source to source. From a psychological standpoint, the HUMINT collector must be cognizant of the following behaviors. People tend to—

- Want to talk when they are under stress and respond to kindness and understanding during trying circumstances. For example, enemy soldiers who have just been captured have experienced a significant stress-producing episode. The natural inclination is for people to want to talk about this sort of experience. If the EPW has been properly segregated and silenced, the HUMINT collector will be the first person the EPW has a chance to talk to. This is a powerful tool for the collector to use to get the subject talking. The desire to talk may also be manifested in refugees, DPs, and even local civilians when confronted by an unsettled situation.
- Show deference when confronted by superior authority. This is culturally dependent but in most areas of the world people are used to responding to questions from a variety of government and quasi-government officials.
- Operate within a framework of personal and culturally derived values. People tend to respond positively to individuals who display the same value system and negatively when their core values are challenged.
- Respond to physical and, more importantly, emotional self-interest. This may be as simple as responding to material rewards such as extra

food or luxury items for their personal comfort or as complex as responding to support in rationalizing guilt.

- Fail to apply or remember lessons they may have been taught regarding security if confronted with a disorganized or strange situation.
- Be more willing to discuss a topic about which the HUMINT collector demonstrates identical or related experience or knowledge.
- Appreciate flattery and exoneration from guilt.
- Attach less importance to a topic if it is treated routinely by the HUMINT collector.
- Resent having someone or something they respect belittled, especially by someone they dislike.

8-7. HUMINT collectors do not "run" an approach by following a set pattern or routine. Each approach is different, but all approaches have the following in common. They—

- Establish and maintain control over the source and collection effort. This does not necessarily equate to physical control. Rather it means that the HUMINT collector directs the conversation to cover the topics that are of interest to him. This may be overt in a debriefing or an interrogation or subtle in an elicitation. In a very basic sense, the HUMINT collector is in control if he is asking questions and receiving answers. If the source is asking questions, refusing to answer questions, or directing or attempting to direct the exchange, he is challenging for control. If the source challenges this control, the HUMINT collector must act quickly and firmly to reestablish control.
- Establish and maintain a rapport between the HUMINT collector and the source. Rapport is a condition established by the HUMINT collector that is characterized by source confidence in the HUMINT collector and a willingness to cooperate with him. This does not necessarily equate to a friendly atmosphere. It means that a relationship is established and maintained that facilitates the collection of information by the HUMINT collector. The HUMINT collector may establish a relationship as superior, equal, or even inferior to the source. The relationship may be based on friendship, mutual gain, or even fear.
- Identify the source's primary emotions, values, traditions, and characteristics and use them to gain the source's willing cooperation.

8-8. The successful application of approach techniques, coupled with measures to ensure source veracity, results in the source providing accurate information in response to the HUMINT collector's requirements. The source may or may not be aware that he is providing the HUMINT collector with needed information. The approach does not end when the source begins providing information but is reinforced as necessary throughout the questioning.

DEVELOPING RAPPORT

8-9. The basis of rapport is source confidence in the HUMINT collector, which leads to a willingness to cooperate. Rapport does not necessarily mean a friendly relationship, although that may be the case. It means an establishment of a relationship in which the HUMINT collector presents a realistic persona designed to evoke cooperation from the source. The source responds with relevant, truthful information. Rapport is established during the approach and must be maintained throughout the questioning of the source. If the HUMINT collector has established good rapport initially and then abandons the effort, the source would rightfully begin to question the HUMINT collector's sincerity and may cease answering questions.

BUILDING RAPPORT

8-10. Building rapport is an integral part of the approach phase. The establishment of rapport begins when the HUMINT collector first encounters the source. Depending on the situation, the HUMINT collector may introduce himself to the source. In debriefing and liaison operations, this will normally be the collector's true name and affiliation. In elicitation, the requirement and type of introduction depends on the operation. In interrogation operations, the HUMINT collector normally will not introduce himself unless he is laying the groundwork for an approach. If he does introduce himself, normally he will adopt a duty position and rank supportive of the approach strategy selected during the planning and preparation phase. The HUMINT collector must select a rank and duty position that is believable based on the HUMINT collector's age, appearance, and experience. A HUMINT collector may, according to international law, use ruses of war to build rapport with interrogation sources, and this may include posing or "passing himself off" as someone other than a military interrogator. However, the collector must not pose as—

- A doctor, medic, or any other type of medical personnel.
- Any member of the International Committee of the Red Cross (ICRC) or its affiliates. Such a ruse is a violation of US treaty obligations.
- A chaplain or clergyman.
- A journalist.
- A member of the US Congress.

8-11. The HUMINT collector should seek advice from his SJA concerning representing himself as holding any other sensitive position.

8-12. A good source assessment is the basis for the approach and vital to the success of the collection effort. The HUMINT collector continually assesses the source to see if the approaches—and later the questioning techniques—chosen in the planning and preparation phase will indeed work. Approaches chosen in planning and preparation are tentative and based on the limited information available from documents, guards, and personal observation. This may lead the HUMINT collector to select approaches that may be totally incorrect for obtaining this source's willing cooperation. Thus, careful assessment of the source is critical to avoid wasting valuable time in the approach phase. Whether the HUMINT collector is using reasoned argument

or emotion to get the source to cooperate, he must be convincing and believable and appear sincere.

RAPPORT POSTURE

8-13. Unless there is rationale for acting otherwise, the HUMINT collector will begin his interaction with the source in a businesslike manner. He will be neither hostile nor overly friendly. Based on the tentative approaches developed during planning and preparation and the verbal and physical clues from the source, the HUMINT collector will modify this posture to facilitate collection.

8-14. Based on planning and preparation, the HUMINT collector may decide to adopt a stern posture. He presents himself as a person in a superior position to the interrogation source and demands proper deference and obedience by the interrogation source. In the case of an EPW this is manifested by having the source remain at attention and address the HUMINT collector as "Sir." This can be effective in dealing with lower ranking military personnel or members of oppressed ethnic, tribal, or religious groups who are conditioned to respond to authority or civilians in lower economic or social positions who are used to responding to directions from various bureaucrats and civilian superiors. This posture can have negative results since many persons in the positions mentioned above have developed mechanisms for dealing with superiors that mostly involve giving minimal information and agreeing with whatever the authority figure says.

8-15. In most cases, either initially or after the interrogation source has begun answering questions, the HUMINT collector will adopt a more relaxed or even sympathetic posture. The HUMINT collector addresses the interrogation source in a friendly fashion, striving to put him at ease. Regardless of the posture selected by the HUMINT collector, he must stay detached emotionally while maintaining the appearance of total involvement and stay within his adopted persona. The HUMINT collector must control his temper at all times. He must not show distaste, disgust, or unease at anything the source says unless that reaction is a planned part of the approach strategy. He should not show surprise at anything that the interrogation source says since it might undermine source confidence in the HUMINT collector and their relationship.

8-16. The HUMINT collector must support his verbal approaches with appropriate body language. Just as the HUMINT collector is observing the source to identify non-verbal clues that support or contradict the verbal message, the HUMINT collector is being scrutinized by the source to identify the same clues. The techniques used in an approach are a totality of effort, not just verbal conversation between the HUMINT collector and the source. Body language is in many instances culturally dependent. Standing at a given distance from an individual may be perceived as comforting in some societies and hostile in others. The HUMINT collector must adapt his body language to the culture in which he is working rather than expect the source to adapt to his.

APPROACH TECHNIQUES

8-17. The approaches listed are not guaranteed solutions for every situation. Some individual approaches that may be suitable for one operating environment, such as when conducting HUMINT contact operations, may be ineffective in another, such as interrogation. Some will be successful with one source and ineffective with another. In any case, everything the HUMINT collector says and does must be in compliance with the applicable law and policy under which the HUMINT collector is operating. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs.

8-18. There are 18 approach techniques that can be employed on any detainee regardless of status or characterization, including EPWs. Additionally, there is one restricted interrogation technique called separation (see Appendix M). Separation cannot be employed on EPWs. With the exception of the direct approach, which may be effective by itself, approach techniques are used in combination with other approaches and techniques. Transitions from one approach to another must be smooth, logical, and convincing.

DIRECT APPROACH

8-19. (Interrogation and Other MSO) Almost all HUMINT collection begins with the direct approach. The exception to this is during elicitation operations that by their very nature are indirect. In using the direct approach, the HUMINT collector asks direct questions (see Chapter 9). The initial questions may be administrative or nonpertinent but the HUMINT collector quickly begins asking pertinent questions. The HUMINT collector will continue to use direct questions as long as the source is answering the questions in a truthful manner. When the source refuses to answer, avoids answering, or falsely answers a pertinent question, the HUMINT collector will begin an alternate approach strategy. The fact that the source is answering questions does not preclude the HUMINT collector from providing an incentive to reward the source and continue his cooperation as long as that incentive does not slow down the collection. For example, a HUMINT collector might offer the source coffee or cigarettes to reward his cooperation. See Chapter 9 for the use of Repeat and Control questions in detecting deception.

8-20. Statistics from interrogation operations in World War II show that the direct approach was effective 90 percent of the time. In Vietnam and in Operations URGENT FURY (Grenada, 1983), JUST CAUSE (Panama, 1989), and DESERT STORM (Kuwait and Iraq, 1991), the direct approach was 95 percent effective. The effectiveness of the direct approach in Operations ENDURING FREEDOM (Afghanistan, 2001-2002) and IRAQI FREEDOM (Iraq, 2003) are still being studied; however, unofficial studies indicate that in these operations, the direct approach has been dramatically less successful. The direct approach is frequently employed at lower echelons when the tactical situation precludes selecting other techniques, and where

the EPW's or detainee's mental state is one of confusion or extreme shock. However, the HUMINT collector must remember that just because a source is answering a direct question does not mean he is being truthful.

INCENTIVE APPROACH

8-21. (Interrogation and Other MSO) The incentive approach is trading something that the source wants for information. The thing that you give up may be a material reward, an emotional reward, or the removal of a real or perceived negative stimulus. The exchange of the incentive may be blatant or subtle. On one extreme, the exchange may be a formal cash payment for information during some contact operations while on the other extreme it may be as subtle as offering the source a cigarette. Even when the direct approach is successful, the HUMINT collector may use incentives to enhance rapport and to reward the source for cooperation and truthfulness. The HUMINT collector must be extremely careful in selecting the options offered to a detainee source. He cannot deny the detainee anything that he is entitled to by law.

8-22. The HUMINT collector also should not offer anything that is not in his power to give. Although this might be expedient in the short term, in the long run it will eliminate source cooperation. When asked to provide something beyond his authority, the HUMINT collector can agree to help, check into, or otherwise support the request without committing himself to its successful accomplishment. HUMINT collectors must be cautious in the use of incentives for the following reasons:

- There is an inherent suspicion of the truthfulness of "bought" information. Sources may manufacture information in order to receive or maintain an incentive. Sources may also "hold back" information in the hopes of trading it at a later date for greater incentives. They may also hold back information if the incentive is not immediately available or guaranteed.
- The incentive must be believable and attainable. The incentive must be within the capability of the HUMINT collector's assumed persona to achieve. For example, if the detainee was captured after killing a US soldier, an incentive of release would not be realistic or believable. Likewise, if the interrogator is presenting himself as being a "harmless clerk" at the detention center, it would be unrealistic to expect a detainee to believe that a clerk could arrange to have the detainee's girlfriend brought to visit him. Such a visit might be possible, but the interrogator's assumed persona would not seemingly provide him with the authority to make it happen.
- The HUMINT collector must provide any promised incentive. A simple promise of an incentive may be sufficient to obtain immediate cooperation. If, however, the HUMINT collector does not follow through on providing the incentive, he will lose credibility and rapport with his source. This may end the cooperation of not only that source but also possibly any potential source who has contact with that source.
- The HUMINT collector may not state or even imply that the basic human rights guaranteed by applicable national and international

laws, regulations, and agreements will be contingent on a detained source's cooperation. An incentive for cooperation is viable only if the HUMINT collector has or is perceived to have the authority to withhold the incentive if the source is not cooperative. A HUMINT collector cannot promise an EPW that he will be treated in accordance with the GPW if he cooperates. This statement implies that the EPW will not be treated properly if he does not cooperate. Since the EPW must be treated in accordance with the GPW whether he cooperates or not, the HUMINT collector will rapidly lose credibility.

EMOTIONAL APPROACHES

8-23. (Interrogation and Other MSO) Emotional approaches are centered on how the source views himself and his interrelationships with others. Through source observation and initial questioning, the HUMINT collector can often identify dominant emotions that motivate the EPW/detainee. The motivating emotion may be greed, love, hate, revenge, or others. The emotion may be directed inward (feelings of pride or helplessness) or outward (love of family). The HUMINT collector employs verbal and emotional ruses in applying pressure to the source's dominant emotions. He then links the satisfaction of these emotions to the source's cooperation. Often, the presentation of like experiences and presenting the source with an opportunity to express his emotions is sufficient to result in cooperation. However, sometimes the source must be presented with a specific action or tangible manifestation of support.

8-24. Although the emotion is the key factor, an emotional approach is normally worthless without an attached incentive. The incentive must meet the criteria listed above for the incentive approach to ensure that the incentive is believable and attainable. For example, this technique can be used on the EPW/detainee who has a great love for his unit and fellow soldiers. Simply having the source express this emotion is not enough. After the source expresses this emotion, the HUMINT collector can take advantage of this by telling the EPW/detainee that by providing pertinent information, he may shorten the war or battle in progress and save many of his comrades' lives, but his refusal to talk may cause their deaths. This gives the source the alternatives of facing the status quo or expressing love of comrades through cooperating with the HUMINT collector.

8-25. Religion is an especially difficult topic to use in any emotional approach. An approach using religion may encourage the source to be further motivated by love, remorse, futility, or even pride to cooperate with the interrogator. On the other hand, an approach using religion may also encourage the source to end any rapport and cooperation with the interrogator. Although it is acceptable to use religion in all interrogation approaches, even to express doubts about a religion, an interrogator is not permitted to denigrate a religion's symbols (for example, a Koran, prayer rug, icon, or religious statue) or violate a religion's tenets, except where appropriate for health, safety, and security reasons. Supervisors should carefully consider the experience level of their subordinates before permitting the use of religion in any interrogation approach.

8-26. Similarly, supervisors should question the appropriateness of demeaning any racial group, including the source's, to elicit an emotional response during an interrogation approach.

8-27. One common danger to the use of emotional approaches is the development of an emotional attachment on the part of the HUMINT collector. It is natural that a source will develop an emotional attachment to the HUMINT collector. The HUMINT collector will often foster this attachment. However, it is vital the HUMINT collector not develop a corresponding emotional attachment to the source. This problem normally develops when a HUMINT collector has contact with one source or a group of similar sources over an extended period of time. There is transference of the source's problems to the HUMINT collector. For example, HUMINT collectors working in a refugee camp frequently begin to view the welfare of the refugees as a greater concern than HUMINT collection. The HUMINT collector, while developing emotion within the source, must act believably but at the same time he must remain detached. He must remember that the emotion is a means to an end (that is, information collection). Supervisors must carefully observe HUMINT collectors for signs of this emotional attachment to the source and take appropriate action ranging from counseling to reassignment.

8-28. The following are types of emotional approaches.

Emotional Love Approach

8-29. (Interrogation and Other MSO) Love in its many forms (friendship, comradeship, patriotism, love of family) is a dominant emotion for most people. The HUMINT collector focuses on the anxiety felt by the source about the circumstances in which he finds himself, his isolation from those he loves, and his feelings of helplessness. The HUMINT collector directs the love the source feels toward the appropriate object: family, homeland, or comrades. If the HUMINT collector can show the source what the source himself can do to alter or improve his situation or the situation of the object of his emotion, the approach has a chance of success.

8-30. The key to the successful use of this approach is to identify an action that can realistically evoke this emotion (an incentive) that can be tied to a detained source's cooperation. For example, if the source cooperates, he can see his family sooner, end the war, protect his comrades, help his country, help his ethnic group. A good HUMINT collector will usually orchestrate some futility with an emotional love approach to hasten the source's reaching the breaking point. In other words if the source does not cooperate, these things may never happen or be delayed in happening. Sincerity and conviction are critical in a successful attempt at an emotional love approach as the HUMINT collector must show genuine concern for the source, and for the object at which the HUMINT collector is directing the source's emotion. The emotional love approach may be used in any MSO where the source's state of mind indicates that the approach may be effective.

Emotional Hate Approach

8-31. (Interrogation and Other MSO) The emotional hate approach focuses on any genuine hate, or possibly a desire for revenge, the source may feel. The HUMINT collector must clearly identify the object of the source's hate and, if necessary, build on those feelings so the emotion overrides the source's rational side. The source may have negative feelings about his country's regime, immediate superiors, officers in general, or fellow soldiers. The emotional hate approach may be used in any MSO where the source's state of mind indicates that the approach may be effective.

8-32. The emotional hate approach may be effective on members of racial or religious minorities who have or feel that they have faced discrimination in military and civilian life. The "hate" may be very specific. For example, a source may have great love for his country, but may hate the regime in control. The HUMINT collector must be sure to correctly identify the specific object of the hate. The emotional hate approach is most effective with the immature or timid source who may have had no opportunity up to this point for revenge, or never had the courage to voice his feelings.

8-33. As in the emotional love approach, the key to the successful application is the linking of the emotion with a tangible manifestation of that emotion. The HUMINT collector must be extremely careful that he does not promise anything that would be contrary to national or international law or US interests or goals. For example, if an EPW feels he has been treated unfairly in his unit, the HUMINT collector can point out that, if the source cooperates and divulges the location of that unit, the unit can be destroyed, thus affording the source revenge. But he cannot promise that the unit if attacked would not be allowed to surrender or that the unit if it surrenders will be treated badly.

8-34. The HUMINT collector must be careful that he does not assume that casual negative comments equate to a strong hate. Many soldiers will make negative comments against their army but will support and defend their army against any "outsider." The HUMINT collector should also not assume generalities; for example, assuming that a member of an ethnic minority hates the ethnic majority just because most ethnic minorities hate those in the ethnic majority.

Emotional Fear-Up Approach

8-35. (Interrogation and Other MSO) Fear is another dominant emotion that can be exploited by the HUMINT collector. In the fear-up approach, the HUMINT collector identifies a preexisting fear or creates a fear within the source. He then links the elimination or reduction of the fear to cooperation on the part of the source. The HUMINT collector must be extremely careful that he does not threaten or coerce a source. Conveying a threat may be a violation of the UCMJ. The HUMINT collector should also be extremely careful that he does not create so much fear that the source becomes unresponsive. The HUMINT collector should never act as if he is out of control or set himself up as the object or focal point of the source's fear. If the HUMINT collector acts in this manner, it is extremely difficult to then act as

the outlet for the fear. Supervisors should consider the experience level of their subordinates before approving their use of this approach.

8-36. If there is a justifiable fear, the HUMINT collector should present it and present a plan to mitigate it if the source cooperates (combination of emotional and incentive approaches). For example, an EPW source says that he will not cooperate because if he does his fellow prisoners will kill him or, if a contact source says that if people find out he is cooperating, his family will suffer. In these cases, the HUMINT collector can point out that the source has already placed himself at risk and he or his family may suffer whether he cooperates or not (justified fear). But if he cooperates, the HUMINT collector will do his best to ensure that either no one will find out or that he will be protected (incentive).

8-37. If there is no justified fear, the HUMINT collector can make use of non-specific fears. "You know what can happen to you here?" A fear-up approach is normally presented in a level, unemotional tone of voice. For example, "We have heard many allegations of atrocities committed in your area and anyone that was involved will be severely punished" (non-specific fear). "If you cooperate with me and answer all of my questions truthfully, I can make sure you are not falsely accused" (incentive). The source should demonstrate some indication of fear, whether verbal or non-verbal, prior to using this approach. If a fear is pre-existing, the approach will work and is legal. If there is no indication of fear, another approach should be considered.

8-38. It is often very effective to use the detainee's own imagination against him. The detainee can often visualize exactly what he is afraid of better than the HUMINT collector can express it.

8-39. The "fear-up" approach is frequently used in conjunction with the emotional love or hate approaches. For example, the HUMINT collector has already established that a detainee source has a strong love of family but is now separated from them. He may state, "I wonder how your family is getting along without you?" (fear of the unknown). He then promises to allow the detainee more than the minimum two letters a month required by the GPW.

Emotional Fear-Down Approach

8-40. (Interrogation and Other MSO) The emotion of fear may dominate the source to the point where he is unable to respond rationally to questioning, especially in interrogation sources. However, the fear-down approach may be used in any MSO where the source's state of mind indicates that it would be an appropriate approach to use. In the fear-down approach the HUMINT collector mitigates existing fear in exchange for cooperation on the part of the source. This is not normally a formal or even voiced agreement. Instead, the HUMINT collector through verbal and physical actions calms the source. Psychologically, the source then views the HUMINT collector as the protector or the one who is providing the calm and wishes to help the HUMINT collector in gratitude and in order to maintain the HUMINT collector as the protector. When used with a soothing, calm tone of voice and appropriate body language, a fear-down approach often creates rapport and nothing else may be needed to get the source to cooperate. At times, however, the

HUMINT collector must describe concrete actions that he will take in order to remove the source's fear.

8-41. Frequently the object of the fear is too traumatic for the source to face directly. While calming the source, the HUMINT collector may initially ask nonpertinent questions and avoid the subject that has caused the source's fear. This develops rapport and establishes communication. The HUMINT collector must remember that his goal is collecting information, not concern with the psychological well being of the source. He will be concerned with the latter only insofar as it helps him obtain the former. This approach technique may backfire if allowed to go too far. After convincing the source he has nothing to fear, the source may cease to be afraid and may feel secure enough to resist the HUMINT collector's pertinent question.

Emotional-Pride and Ego-Up Approach

8-42. (Interrogation and Other MSO) The emotional-pride and ego-up approach may be used in any MSO. It exploits a source's low self-esteem. Many HUMINT sources including EPWs and other detainees, retained persons, civilian internees, or refugees may suffer from low self-esteem and feelings of helplessness due to their immediate circumstances. Others, such as individuals or members of social or ethnic groups that have been discriminated against or low-ranking members of organizations (including the military), may also show low self-worth. In this technique, the source is flattered into providing certain information in order to gain credit and build his ego. The HUMINT collector must take care to use a flattering somewhat-in-awe tone of voice, and speak highly of the source throughout this approach while remaining believable. This should produce positive feelings on the source's part as he receives desired recognition. The source will eventually reveal pertinent information to solicit more favorable comments from the HUMINT collector.

8-43. This technique can also be employed in another manner—by flattering the source into admitting certain information in order to gain credit. For example, while interrogating a suspected saboteur, the HUMINT collector states: "This was a smooth operation. I have seen many previous attempts fail. I bet you planned this. Who else but a clever person like you would have planned it? When did you first decide to do the job?"

8-44. A variation of this approach can also be used on individuals with strong egos. It is based on the premise that everyone likes to talk about what they do best. The HUMINT collector shows interest in and asks the source to explain an aspect of his job. The questioning begins with nonpertinent aspects of the source's job. The HUMINT collector displays interest and asks increasingly technical and pertinent questions. For example, if the source is an EPW who was a pilot, the HUMINT collector might begin by asking him what it is like to fly. As the source talks about this, the collector demonstrates interest and gradually uses questions to lead the conversation to capabilities of specific aircraft, specific missions that the pilot has flown, tactics, or whatever topic is a priority for collection.

Emotional-Pride and Ego-Down Approach

8-45. (Interrogation) The emotional-pride and ego-down approach is based on attacking the source's ego or self-image. The source, in defending his ego, reveals information to justify or rationalize his actions. This information may be valuable in answering collection requirements or may give the HUMINT collector insight into the viability of other approaches. This approach is effective with sources who have displayed weakness or feelings of inferiority. A real or imaginary deficiency voiced about the source, loyalty to his organization, or any other feature can provide a basis for this technique.

8-46. The HUMINT collector accuses the source of weakness or implies he is unable to do a certain thing. This type of source is also prone to excuses and rationalizations, often shifting the blame to others. An example of this technique is opening the collection effort with the question, "Why did you surrender so easily when you could have escaped by crossing the nearby ford in the river?" The source is likely to provide a basis for further questions or to reveal significant information if he attempts to explain his surrender in order to vindicate himself. He may give an answer such as, "No one could cross the ford because it is mined."

8-47. The objective is for the HUMINT collector to use the source's sense of pride by attacking his loyalty, intelligence, abilities, leadership qualities, slovenly appearance, or any other perceived weakness. This will usually goad the source into becoming defensive, and he will try to convince the HUMINT collector he is wrong. In his attempt to redeem his pride and explain his actions, the source may provide pertinent information. Possible targets for the emotional-pride and ego-down approach are the source's—

- Loyalty.
- Technical competence.
- Leadership abilities.
- Soldierly qualities.
- Appearance.

8-48. There is a risk associated with this approach. If the emotional-pride and ego-down approach fails, it is difficult for the HUMINT collector to recover and move to another approach without losing his credibility. Also, there is potential for application of the pride and ego approach to cross the line into humiliating and degrading treatment of the detainee. Supervisors should consider the experience level of their subordinates and determine specifically how the interrogator intends to apply the approach technique before approving the interrogation plan.

Emotional-Futility

8-49. (Interrogation and Other MSO) The emotional-futility approach is generally used in an interrogation setting, but may also be used for other MSO, if indicated by the source's state of mind. In the emotional-futility approach, the HUMINT collector convinces the source that resistance to questioning is futile. This engenders a feeling of hopelessness and helplessness on the part of the source. Again as with the other emotional approaches, the HUMINT collector gives the source a "way out" of the

helpless situation. For example "it is hopeless for your forces to continue fighting because they can no longer get supplies, but you can help end the war and their suffering." When employing this technique, the HUMINT collector must have factual information. The HUMINT collector presents these facts in a persuasive, logical manner. He should be aware of and able to exploit the source's psychological and moral weaknesses, as well as weaknesses inherent in his society.

8-50. The futility approach is effective when the HUMINT collector can play on doubts that already exist in the source's mind. Factual or seemingly factual information must be presented in a persuasive, logical manner, and in a matter-of-fact tone of voice. Making the situation appear hopeless allows the source to rationalize his actions, especially if that action is cooperating with the HUMINT collector. When employing this technique, the HUMINT collector must not only have factual information but also be aware of and exploit the source's psychological, moral, and sociological weaknesses. Another way of using the futility approach is to blow things out of proportion. If the source's unit was low on, or had exhausted, all food supplies, he can be easily led to believe all of his forces had run out of food. If the source is verging on cooperating, it may aid the collection effort if he is told all the other sources have cooperated.

8-51. The futility approach must be orchestrated with other approach techniques (for example, love of comrades). A source who may want to help save his comrades' lives may be convinced the battlefield situation is hopeless and they will die without his assistance. The futility approach is used to paint a bleak picture for the prisoner, but it is not normally effective in and of itself in gaining the source's cooperation.

Other Approaches

8-52. There are numerous other approaches but most require considerable time and resources. Most are more appropriate for use with sources who are detainees, but some, such as change of scenery, may have application for elicitation or MSO.

8-53. **We Know All**. (Interrogation) In the "we know all" approach technique, the HUMINT collector subtly convinces the source that his questioning of the source is perfunctory because any information that the source has is already known. This approach may be employed in conjunction with the "file and dossier" technique or by itself. If used alone, the HUMINT collector must first become thoroughly familiar with available data concerning the source and the current situation. To begin the collection effort, the HUMINT collector asks questions based on this known data.

8-54. When the source hesitates, refuses to answer, or provides an incorrect or incomplete reply, the HUMINT collector provides the detailed answer himself. The HUMINT collector may even complete a source's answer, as if he is bored and just "going through the motions." When the source begins to give accurate and complete information, the HUMINT collector interjects pertinent questions. Questions to which answers are already known are also asked periodically to test the source's truthfulness and to maintain the deception that the information is already known. There are some inherent

problems with the use of the "we know all" approach. The HUMINT collector is required to prepare everything in detail, which is time consuming. He must commit much of the information to memory, as working from notes may show the limits of the information actually known. It is also only usable when sufficient prior information exists to convince the source that "we know all."

8-55. **File and Dossier**. (Interrogation) The file and dossier approach is a variation of the "we know all" approach. The HUMINT collector prepares a dossier containing all available information concerning the source or his organization. The information is carefully arranged within a file to give the illusion that it contains more data than actually there. The file may be padded with extra paper if necessary. Index tabs with titles such as education, employment, criminal record, military service, and others are particularly effective. It is also effective if the HUMINT collector is reviewing the dossier when the source enters the room and the source is able to read his name on the dossier and sees the numerous topics and supposed extent of the files.

8-56. The HUMINT collector proceeds as in the "we know all" approach. He refers to the particular labeled segment of the dossier before, during, or after asking a question. In the early stages of questioning, the HUMINT collector asks questions to which he has the answer. He may answer along with the source, complete the information for the source, or even show the source where the information is entered in the dossier. He never lets the source physically handle the dossier. As the source becomes convinced that all the information that he knows is contained within the dossier, the HUMINT collector proceeds to topics on which he has no or little information. In doing so, he still refers to the appropriate section of the dossier and may even nod his head knowingly or tell the source that the information the source is providing still matches what is in the dossier.

8-57. This technique has several limitations and drawbacks. The preparation time in developing the dossier is extensive. The success of this technique is largely dependent on the naiveté of the source, volume of data on the subject, and skill of the HUMINT collector in convincing the source that the dossier is more complete than it actually is. There is also the risk that a less naïve source will refuse to cooperate, claiming that, if the collector already knows everything, there is no need for him to talk. Also with this technique, the HUMINT collector is limited in the method he may use to record new information. If the HUMINT collector writes down information, it destroys the illusion that all the information has already been obtained. The HUMINT collector is normally limited to using electronic recording devices or his memory. The HUMINT collector can also arrange ahead of time for another interrogator or analyst to take notes for him, undetected by the source. This could be especially effective in a situation where a separate monitoring area (for oversight) is used by the analyst.

8-58. **Establish Your Identity**. (Interrogation) In using this approach, the HUMINT collector insists the detained source has been correctly identified as an infamous individual wanted by higher authorities on serious charges, and he is not the person he purports to be. In an effort to clear himself of this

allegation, the source makes a genuine and detailed effort to establish or substantiate his true identity. In so doing, he may provide the HUMINT collector with information and leads for further development. The HUMINT collector should initially refuse to believe the source and insist he is the individual wanted by the ambiguous higher authorities. This will force the source to give even more detailed information in order to convince the HUMINT collector he is who he says he is.

8-59. **Repetition**. (Interrogation) The repetition approach is used to induce cooperation from a hostile source. In one variation of this approach, the HUMINT collector listens carefully to a source's answer to a question, and then repeats the question and answer several times. He does this with each succeeding question until the source becomes so thoroughly bored with the procedure, he answers questions fully and candidly to satisfy the HUMINT collector and gain relief from the monotony of this method. The repetition technique must be judiciously used, as it will generally be ineffective when employed against introverted sources or those having great self-control. It may also provide an opportunity for a source to regain his composure and delay the collection effort. In this approach, the use of more than one HUMINT collector or a tape recorder has proven effective.

8-60. **Rapid Fire**. (Interrogation) The rapid-fire approach is based upon the principles that—

- Everyone likes to be heard when he speaks.
- It is confusing to be interrupted in mid-sentence with an unrelated question.

8-61. This approach may be used by one, two, or more HUMINT collectors to question the source. In employing this technique, the HUMINT collectors ask a series of questions in such a manner that the source does not have time to answer a question completely before the next one is asked. This confuses the source, and he will tend to contradict himself as he has little time to formulate his answers. The HUMINT collectors then confront the source with the inconsistencies causing further contradictions. In many instances, the source will begin to talk freely in an attempt to explain himself and deny the HUMINT collector's claims of inconsistencies. In this attempt, the source is likely to reveal more than he intends, thus creating additional leads for further exploitation. This approach may be orchestrated with the emotional-pride and ego-down or fear-up approaches. Besides extensive preparation, this approach requires experienced and competent HUMINT collectors, with comprehensive case knowledge and fluency in the source's language.

8-62. **Silent**. (Interrogation) The silent approach may be successful when used against either a nervous or confident source. When employing this technique, the HUMINT collector says nothing to the source, but looks him squarely in the eye, preferably with a slight smile on his face. It is important not to look away from the source but force him to break eye contact first. The source may become nervous, begin to shift in his chair, cross and re-cross his legs, and look away. He may ask questions, but the HUMINT collector should not answer until he is ready to break the silence. The source may blurt out questions such as, "Come on now, what do you want with me?" When the HUMINT collector is ready to break silence, he may do so with questions

such as, "You planned this operation for a long time, didn't you? Was it your idea?" The HUMINT collector must be patient when using this technique. It may appear the technique is not succeeding, but usually will when given a reasonable chance.

8-63. **Change of Scenery**. (Interrogation and Other MSO) The change-of-scenery approach may be used in any type of MSO to remove the source from an intimidating atmosphere such as an "interrogation" room type of setting and to place him in a setting where he feels more comfortable speaking. Bringing a source into a formal setting to conduct an interrogation or debriefing has psychological implications. On the positive side, it places the HUMINT collector in a superior position since he is operating on his "home turf" and has set the conditions for the meeting. It allows the HUMINT collector control over the immediate environment including the positioning of the participants, to establish the desired atmosphere for the approach.

8-64. However, there are potential negative factors in the conduct of questioning in an "Interrogation Room" environment. The source may be intimidated and more guarded; he may consider the formal setting in terms of an adversarial relationship; and he may limit his answers as a mode of self-protection. In some circumstances, the HUMINT collector may be able to invite the source to a different setting for coffee and pleasant conversation. When removed from the formal environment, the source may experience a feeling of leaving the interrogation behind. The perceived reduced pressure may lower his guard and allow him to attach less significance to conversation that occurs outside the formal setting, even though pertinent information is still being discussed. During the conversation in this more relaxed environment, the HUMINT collector steers the conversation to the topic of interest. Through this somewhat indirect method, he attempts to elicit the desired information. The source may never realize he is still being questioned.

8-65. **Mutt and Jeff. (Interrogation)** The goal of this technique is to make the source identify with one of the interrogators and thereby establish rapport and cooperation. This technique involves a psychological ploy that takes advantage of the natural uncertainty and guilt that a source has as a result of being detained and questioned. Use of this technique requires two experienced HUMINT collectors who are convincing actors. The two HUMINT collectors will display opposing personalities and attitudes toward the source. For example, the first HUMINT collector is very formal and displays an unsympathetic attitude toward the source. He may, for instance, be very strict and order the source to follow all military courtesies during questioning. Although he conveys an unfeeling attitude, the HUMINT collector is careful not to threaten or coerce the source. Conveying a threat of violence is a violation of the UCMJ.

8-66. At the point when the interrogator senses the source is vulnerable, the second HUMINT collector appears (having received his cue by a signal, hidden from the source, or by listening and observing out of view of the source), and scolds the first HUMINT collector for his uncaring behavior and orders him from the room. The second HUMINT collector then apologizes to soothe the source, perhaps offering him a beverage and a cigarette. He

explains that the actions of the first HUMINT collector were largely the result of an inferior intellect and lack of sensitivity. The inference is that the second HUMINT collector and the source share a high degree of intelligence and sensitivity.

8-67. The source is normally inclined to have a feeling of gratitude towards the second HUMINT collector, who continues to show sympathy in an effort to increase rapport and control for the questioning that will follow. If the source's cooperation begins to fade, the second HUMINT collector can hint that he is a busy person of high rank, and therefore cannot afford to waste time on an uncooperative source. He can broadly imply that the first HUMINT collector might return to continue the questioning. The Mutt and Jeff approach may be effective when orchestrated with Pride and Ego Up and Down, Fear Up and Down, Futility, or Emotional Love or Hate.

8-68. **Oversight Considerations:** Planned use of the Mutt and Jeff approach must be approved by the first O-6 in the interrogator's chain of command. The HUMINT collector must include as a part of the interrogation plan—

- No violence, threats, or impermissible or unlawful physical contact.
- No threatening the removal of protections afforded by law.
- Regular monitoring of the interrogation shall be performed by interrogation personnel.

8-69. **False Flag.** (Interrogation) The goal of this technique is to convince the detainee that individuals from a country other than the United States are interrogating him, and trick the detainee into cooperating with US forces. For example, using an interrogator who speaks with a particular accent, making the detainee believe that he is actually talking to representatives from a different country, such as a country that is friendly to the detainee's country or organization. The False Flag approach may be effectively orchestrated with the Fear Down approach and the Pride and Ego Up.

8-70. **Oversight Considerations:** The interrogation chain of command must coordinate an interrogation plan that uses the False Flag approach with the legal representative and the 2X, and receive approval from the first O-6 in the interrogator's chain of command for each specific use of the False Flag approach.

- The use of the False Flag approach must complement the overall interrogation strategy and other approach techniques listed in the interrogation plan.
- When a HUMINT collector intends to pose as a national of a third-party country, that country must be identified in the interrogation plan.
- No implied or explicit threats that non-cooperation will result in harsh interrogation by non-US entities.
- HUMINT collectors will not pose or portray themselves as any person prohibited by this manual, paragraphs 8-10 and 8-11 (for example, an ICRC representative).

8-71. **Separation.** See Appendix M, Restricted Interrogation Technique – Separation.

Selecting an Approach

8-72. There often is insufficient information available to determine an approach other than the direct approach. In this case where the source answers questions but will not discuss pertinent issues, the HUMINT collector may ask direct but nonpertinent questions to obtain sufficient information to develop an approach strategy. This technique is also useful in debriefing to establish rapport. Nonpertinent questions may include—

- Asking about immediate past events. This includes asking an EPW about the circumstances of his capture or asking a refugee about the circumstances concerning his arrival at the refugee point or checkpoint. By doing this, the HUMINT collector can gain insight into the source's current state of mind and, more importantly, he can ascertain his possible approach techniques.
- Asking background questions. This includes asking about the source's family, work, friends, likes, and dislikes. These types of questions can develop rapport and provide clues as to the source's areas of knowledge or reveal possibilities for incentives or emotional approaches.
- Considering what are culturally and socially acceptable topics of discussion. For example, asking an Arab male about his wife could be considered extremely rude, whereas not asking an American the same question might be seen as insensitive.

Making Smooth Transitions

8-73. With the exception of the direct approach, no other approach is effective by itself. HUMINT collectors use different approach techniques or combine them into a cohesive, logical technique. Smooth transitions, sincerity, logic, and conviction are needed to make a strategy work. HUMINT collectors must carefully assess the source's verbal or nonverbal clues to determine when a change in approach strategy is required. The HUMINT collector must guide the conversation smoothly and logically, especially when moving from one approach technique to another. Using transitional phrases can make logical and smooth tie-ins to another approach. By using nonpertinent questions, the HUMINT collector can move the conversation in the desired direction and, as previously stated, sometimes can obtain leads and hints about the source's stresses or weaknesses or other approach strategies that may be more successful.

Recognizing Source Cooperation

8-74. Each source has a point where he will begin to cooperate and answer questions. Some sources will begin answering questions completely and truthfully with no preparation; others might require hours or even days of work. The amount of time that a HUMINT collector spends on an approach depends on a variety of factors. These include—

- The quality and criticality of the information believed to be possessed by the source.
- The presence or absence of other sources that probably possess that information.
- The number of HUMINT collectors and sources available.
- The LTIOV that the HUMINT collector is attempting to obtain.

8-75. The HUMINT collector needs to identify the signs that the source is approaching or has reached the point of cooperation. For example, if during the approach the source leans forward with his facial expression indicating an interest in the proposal or is more hesitant in his argument, he is probably nearing the point where he will cooperate. The HUMINT collector must also be aware of the fact that a source can begin to cooperate in certain areas while continuing to resist strongly in other areas. The HUMINT collector should recognize the reason for refusal, overcome the objection, and stress the benefit of cooperating (reinforce the approach). Once the HUMINT collector determines the source is cooperating, he should interject pertinent questions. If the source does not answer the question, the HUMINT collector should continue with his approach or switch to an alternate approach technique and continue to work until he again believes the source will cooperate. If the source answers the pertinent question, the HUMINT collector continues asking relevant questions until the questioning session is completed.

8-76. If a cooperative source balks at answering a specific line of questions, the HUMINT collector must assess the reason for the refusal. The HUMINT collector may have arrived at a topic that the source finds particularly sensitive. Other reasons that might cause a source to stop answering questions are fatigue or unfamiliarity with the new topic. If this topic is critical, the HUMINT collector may have to reinforce the previously successful approach or may have to use a different approach.

APPROACH STRATEGIES FOR INTERROGATION

8-77. Interrogation does not mean a hostile relationship between the HUMINT collector and the source. In fact, most interrogation sources (90 percent or more) cooperate in response to the direct approach. Unfortunately, those sources who have the placement and access to make them high priority sources are also the ones with the highest degree of security awareness. A source who uses counter-interrogation techniques such as delaying, trying to control the conversation, or interrogating the HUMINT collector himself may—

- Be an intelligence trained soldier.
- Be survival, evasion, resistance, and escape (SERE) trained.
- Be a terrorist.
- Have been a detainee or previously incarcerated.

8-78. In stability and reconstruction operations and civil support operations, detainees are often politically motivated and resistant to most approaches.

8-79. EPWs are normally vulnerable to basic incentive and emotional approach techniques. Most EPWs are traumatized to various degrees by the events preceding or surrounding their capture. They tend to be disoriented and exhibit high degrees of fear and anxiety. This vulnerable state fades over time, and it is vital for HUMINT collectors to interrogate EPWs as soon as and as close to the point of capture as possible. The earlier that an EPW is questioned the more likely he is to cooperate. And the earlier that he begins to cooperate, the more likely he is to continue to cooperate. It is also vital that the HUMINT collector be the first person that the EPW has a chance to talk to. This means that proper silencing and segregation of the sources by whoever is transporting them is an important part of a successful approach.

8-80. The vulnerability of civilian detainees to approach techniques available to the HUMINT collector may be dependent on the exact nature of the conflict. US HUMINT collectors are obligated to treat all detainees in accordance with applicable law and policy. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs. Detainees and, in particular, EPWs are guaranteed certain rights and privileges. The HUMINT collector may not take any action to remove, state that he will remove, or imply that he will remove any guaranteed right if a detainee fails to cooperate. Under the GPW, EPWs cannot be denied their rights or their privileges accorded them by rank as guaranteed by the GPW. Privileges afforded to them, however, which are not guaranteed by the Geneva Conventions or other applicable law or agreements, may be withheld. (See Appendix A, Section I.) Consult your SJA for questions concerning rights and privileges.

8-81. The HUMINT collector is frequently under a great deal of pressure to "produce results." This situation, coupled with the facts that the HUMINT collector is dealing with threat personnel who may have been attempting to kill US personnel just minutes before questioning and the fact that the source is in a vulnerable state, leads to a tendency to use fear-up techniques. This may, in some circumstances, be the proper approach; however, the HUMINT collector must ensure that in doing so he neither loses control of his own emotions nor uses physical or mental coercion.

APPROACH STRATEGIES FOR DEBRIEFING

8-82. Sources who are debriefed vary even more widely than those who are interrogated. Since debriefing is the systematic questioning of individuals not in the custody of the questioning forces, the HUMINT collector needs to engender an atmosphere of cooperation and mutual benefit. Some sources for debriefing include members of the friendly forces and local personnel. HUMINT collectors often believe that approach techniques are not required for friendly forces and that friendly forces should view debriefing as part of their duties and in their own best interest. However, this is not necessarily the case.

8-83. Many people see debriefing as an interruption in their normal duties and a waste of their time. HUMINT collectors must be sure to stay focused on the purpose and goals of the debriefing. They should be businesslike and must maintain the proper relationship with the source based on his rank and position. The HUMINT collector should allow senior sources more latitude to interpose their opinions and evaluations. A change of scene often facilitates the debriefing of a high-level source since it removes him from his normal distractions, such as the telephone, and allows him to concentrate on the topics being discussed.

8-84. Refugees and DPs are subject to many of the same anxieties and trauma that are experienced by EPWs or other detainees, with the added benefit to the HUMINT collector that they normally have an obvious vested interest in cooperating. Basic incentives usually are sufficient to induce their willing cooperation. The emotional support that can be provided by the HUMINT collector by simply listening and commiserating with their hardship is often sufficient to gain cooperation. The emotional approaches such as love of family and hate toward those who made them refugees are strong motivators toward cooperation.

8-85. The approach techniques used in the questioning of local civilians are probably the most difficult. The approach techniques chosen must take into consideration the attitude of the local population toward the US and its presence and cultural considerations. The local population must see their cooperation as self-beneficial.

APPROACH STRATEGIES FOR ELICITATION

8-86. Elicitation is a sophisticated technique used when conventional collection techniques cannot be used effectively. Of all the collection methods, this one is the least obvious. However, it is important to note that elicitation is a planned, systematic process that requires careful preparation. It is always applied with a specific purpose in mind. This objective is the key factor in determining the subject (which source to question), the elicitor, and the setting. The subject will be selected based on access to or knowledge of the desired information.

8-87. Before approaching the subject, it is necessary to review all available intelligence files and records, personality dossiers, and knowledge possessed by others who have previously dealt with the subject. This will help determine the subject's background, motivation, emotions, and psychological nature. It also may require unobtrusive observation of the subject to establish such things as patterns of activity and likes and dislikes. The setting can be any number of social or official areas. It is important to note that the source should be approached in his natural surroundings, as this will diminish suspicion.

8-88. The key to elicitation is the establishment of a rapport between the elicitor and the source, normally based on shared interests. In the initial stages of an elicitation, the collector confines his conversations to innocuous subjects such as sports and social commentary. Dependent on the value of the source, the collection environment, and the security consciousness of the

source the initial stage could last from a few minutes to numerous seemingly accidental meetings over a period of weeks or months. The HUMINT collector will gradually shift the conversation to topics of collection interest but will be prepared to return to more unthreatening topics based on negative reactions on the part of the subject. Once a topic of interest has been introduced, the HUMINT collector keeps the conversation going by asking for clarification (for example, "I agree, however, what did you mean by….?") or expressing a hypothetical situation.

8-89. There are two basic elicitation approaches: mild flattery and provocation.

- Mild Flattery: Most people like talking about their interests and like talking to those who are knowledgeable and interested in the same topics. People also like to speak to someone who values their opinion on shared interests. The HUMINT collector takes advantage of this. The HUMINT collector leads the conversation into areas that he wishes to collect but does it in such a way that it appears to the source that the source is leading the conversation. Above all in elicitation, the HUMINT collector plays the role of the rapt, attentive, and inquisitive listener.
- Provocation: This is a more dangerous approach and, if used too early in an operation, can alienate the source. Once the HUMINT collector has established shared interests with the source, he can selectively challenge some of the source's statements, encouraging the source to provide more information in support of his view. The HUMINT collector can also insert bits of actual information into the conversation to cause the source to confirm and expound on the topic. Care must be taken so as not to give away more information than is gained.

TERMINATION PHASE

8-90. When it is necessary or prudent, the HUMINT collector will terminate the questioning of a particular source. Whatever the reason for terminating, the HUMINT collector must remember there is a possibility that someone may want to question the source at a later date. There are many reasons why a HUMINT collector may want or need to terminate questioning:

- The source remains uncooperative during the approach phase.
- The collection objective cannot be met in one questioning session.
- The HUMINT collector fails to maintain rapport and loses control of the questioning.
- The collection objectives have been satisfied.
- The HUMINT collector or the source becomes physically or mentally unable to continue.
- Information possessed by the source is of such value that his immediate evacuation to the next echelon is required.
- The HUMINT collector's presence is required elsewhere.

8-91. There are many ways to conduct a termination, but the following points must be conveyed to the source:

- The HUMINT collector should sincerely and convincingly reinforce successful approaches. All promised incentives should be rendered.
- The source must be told the information he gave will be checked for truthfulness and accuracy. His reaction to this statement should be closely monitored. The exact form of this statement will be dependent on the situation. It should not be done in a manner to alienate a cooperative source.
- The source must be told that the same or another individual may speak to him again. This sets the stage for future contacts.
- Any identification must be returned to the source. If the HUMINT collector has other documents or belongings of the detainee (such as letters or photographs), he will either return them to the detainee, if appropriate, or will turn them over to the MP guard. Depending on the circumstances and the legal status of the detainee, the MPs will retain the detainee's property and return the property to him at the end of his internment.
- In a debriefing, the HUMINT collector will normally ask the source not to discuss the subject of the questioning for his own protection. In interrogation operations, the HUMINT collector normally coordinates with the holding area guards to have the detainees who have been interrogated kept separate from sources who have not yet been interrogated if the situation allows.

Chapter 9

Questioning

9-1. Questioning is one of the five phases of HUMINT collection. Developing and using good questioning techniques enable the HUMINT collector to obtain accurate and pertinent information and to extract the maximum amount of information in the minimum amount of time. The HUMINT collector must know when to use different types of questions.

GENERAL QUESTIONING PRINCIPLES

9-2. Questions should be presented in a logical sequence to avoid neglecting significant topics. The HUMINT collector begins the questioning phase with the first topic in the sequence he tentatively established as part of his questioning plan. He obtains all of the source's pertinent knowledge in this topical area before moving on to the next topic in his sequence. The only exception is exploiting a hot lead, which is discussed in paragraph 9-21.

9-3. The HUMINT collector must at all times remember that his mission is the rapid collection and dissemination of accurate information. He must not allow himself to be sidetracked into nonpertinent discussions or debates nor should he express distaste or value judgments on the information being supplied unless that is a planned part of his approach technique. The HUMINT collector uses vocabulary that is clear, unambiguous, and understandable by the source. The source may not be on the same intellectual level or have the same degree of education as the HUMINT collector, so the HUMINT collector must adapt his questioning to the level of the source. The source may also have specific technical knowledge, more education and/or a higher intellectual level than the HUMINT collector. In this case, the HUMINT collector normally relies on prepared questions or technical support for his questioning. Without good systematic questioning techniques, even the most cooperative source may provide only minimal usable information.

DIRECT QUESTIONS

9-4. Direct questions are basic questions normally beginning with an interrogative (who, what, where, when, how, or why) and requiring a narrative answer. They are brief, precise, and simply worded to avoid confusion. The HUMINT collector must consider the probable response of the source to a particular question or line of questioning and should not, if at all possible, ask direct questions likely to evoke a refusal to answer or to antagonize the source.

TYPES OF DIRECT QUESTIONS

9-5. The HUMINT collector must be able to use the following types of direct questions:

- Initial, topical.
- Follow-up.
- Nonpertinent.
- Repeat.
- Control.
- Prepared.

Initial Questions

9-6. The HUMINT collector begins his questioning with the first topic in his collection plan and asks all the basic questions necessary to cover the topic. The answers to the basic questions will determine the requirements for follow-up questioning. The initial questions are directed toward obtaining the basic information on the topic. In other words, they are the "who, what, where, when, how, and why" of each topic.

Follow-up Questions

9-7. Follow-up questions are used to expand on and complete the information obtained from the initial questions. Often even if the initial question is a well-constructed direct question, it will elicit only a partial answer. For example, when asked, "Who is going to attack?" The source might say, "My unit." Follow-up questions are used to determine precisely what the source means by "my unit" and what other units may also attack. The answer to follow-up questions may lead to more follow-ups until the source's knowledge on a given topic is exhausted. At a minimum, upon receiving a positive answer to an initial question, the HUMINT collector needs to ask "Who (what, where, when, why, how) else?" For example, if the HUMINT collector asks the source, "Who, in the local government is collaborating with the insurgents?" and is told a name in response, he will ask follow-up questions to determine all the required information about this individual and then will ask, "Who else, in the local government is collaborating with the insurgents?" This will continue until the source's knowledge in this area is exhausted.

Nonpertinent Questions

9-8. Nonpertinent questions are questions that do not pertain to the collection objectives. They are used to conceal the collection objectives or to strengthen rapport with the source. They are essential when the collector is using the elicitation technique. Nonpertinent questions may be used to gain time for the HUMINT collector to formulate pertinent questions and may also be used to break the source's concentration, particularly, if the HUMINT collector suspects the source is lying. It is hard for a source to be a convincing liar if his concentration is frequently interrupted.

Repeat Questions

9-9. Repeat questions ask the source for the same information obtained in response to earlier questions. They are a method to confirm accuracy of important details such as place names, dates, and component parts of technical equipment and to test truthfulness. Repeat questions should not be exact repetitions of an earlier question. The HUMINT collector must rephrase or otherwise disguise the previous question. The repeat question also needs to be separated in time from the original question so that the source cannot easily remember what he said. Repeat questions may also be used to develop a topic the source had refused to talk about earlier.

Control Questions

9-10. Control questions are developed from recently confirmed information from other sources that is not likely to have changed. They are used to check the truthfulness of the source's responses and should be mixed in with other questions throughout the questioning. If a source fails to answer a control question as expected, it may be an indicator that he is lying. However, there are other possible explanations. The source—

- Could have misunderstood the question.
- Could be making up information in order to please the questioner and/or receive a promised incentive.
- Could have answered the question truthfully to the best of his ability, but his information could be wrong or outdated.
- May be correct and the information that the control question was based on is no longer true.

9-11. It is the responsibility of the HUMINT collector to determine, through follow-up questions, which of the possibilities is the case. The HUMINT collector should also consult with the HAT for assistance in verifying the source reporting through all-source analysis.

Prepared Questions

9-12. Prepared questions are questions developed by the HUMINT collector, normally in writing, prior to the questioning. Prepared questions are used primarily when dealing with information of a technical nature or specific topic, which requires the HUMINT collector to formulate precise and detailed questions beforehand. The HUMINT collector may have to research analytical or technical material or contact SMEs to assist him in preparing questions. HUMINT collectors must not allow the use of prepared questions or any limitations to their education or training to restrict the scope and flexibility of their questioning. In many instances, the HUMINT collector should have an analyst or technical expert “sit in” on the questioning as well.

9-13. The HUMINT collector must be able to use the different types of questions effectively. Active listening and maximum eye-to-eye contact with the source will provide excellent indicators for when to use follow-up, repeat, control, and nonpertinent questions. The HUMINT collector must use direct and follow-up questions to fully exploit subjects pertinent to his interrogation objectives. He should periodically include control, repeat, and nonpertinent

questions in order to check the truthfulness and consistency of the source's responses and to strengthen rapport.

TYPES OF QUESTIONS TO AVOID

9-14. When using the questioning methodologies of interrogation, HUMINT collectors should avoid using negative, compound, or vague questions. Leading questions are usually to be avoided, but some special questioning techniques, such as use of a polygraph, require the use of leading questions.

Leading Questions

9-15. Leading questions are questions that are constructed so as to require a yes or no answer rather than a narrative response. They generally begin with a form of the verb "to be" (such as "is," "was," "were," "will," "are"). For example, "Is the mayor working with the insurgents?" Leading questions should generally be avoided for the following reasons:

- They make it easier for the source to lie since the source only provides minimal information.
- It takes longer to acquire information.
- A source, particularly one that is frightened or trying to get an incentive, will tend to answer in the way that he thinks the HUMINT collector wants him to answer.

9-16. Although normally avoided during questioning, an experienced HUMINT collector may use leading questions when the technical nature of the subject matter or the specific information needed leaves no alternatives. Leading questions can be used to—

- Verify specific facts.
- Pinpoint map locations.
- Confirm information obtained during map tracking.
- Transition from one topic area to another.

Negative Questions

9-17. Negative questions are questions that contain a negative word in the question itself such as, "Didn't you go to the pick-up point?" If the source says "yes," the HUMINT collector is faced with the question of whether he means "yes, I went to the pick-up point" or "yes, I didn't go to the pick-up point." When the source answers, the HUMINT collector cannot be sure what the answer means; therefore, he must ask additional questions. This can be particularly confusing when working with an interpreter. Other cultures may interpret a negative question in a way other than what the HUMINT collector meant. Negative questions should never be used during questioning unless they are being used deliberately during the approach to make the source appear to contradict himself. In other instances, the insertion of negative words within the question makes them impossibly open-ended. For example, "Who didn't attend the meeting?"

Compound Questions

9-18. Compound questions consist of two questions asked at the same time; for example, "Before you were captured today, were you traveling north or south?" Or “Where were you going after work and who were you to meet there?” They are easily misunderstood and may confuse the source or force him to give an ambiguous answer. Compound questions allow the source to evade a part of the question or to give an incomplete answer.

Vague Questions

9-19. Vague questions do not have enough information for the source to understand exactly what the HUMINT collector is asking. They may be incomplete, general, or otherwise nonspecific and create doubt in the source's mind. Vague questions confuse the source, waste time, and are easily evaded. They result in answers that may confuse or mislead the HUMINT collector and require further follow-up questions.

ELICITATION

9-20. Elicitation is the gaining of information through direct interaction with a human source where the source is not aware of the specific purpose for the conversation. Elicitation is a sophisticated technique used when conventional questioning techniques cannot be used effectively. Of all the collection methods, this one is the least obvious. However, it is important to note that elicitation is a planned, systematic process that requires careful preparation. Elicitation is always applied with a specific objective in mind and normally directed toward a specific source.

LEADS

9-20. A lead is a statement made by a source spontaneously or in response to questioning that leads the questioner to believe that the source has information on a topic other than the one currently under discussion. Documents captured with or on the source may also be exploited as sources of leads. Leads are referred to as either “hot” or “cold.”

HOT LEADS

9-21. A hot lead is a statement made by a source either spontaneously or in response to questioning that indicates he has information that could answer intelligence requirements on a topic other than the one currently under discussion. The lead could also be on a topic that although not listed as a requirement is, based on the HUMINT collector’s experience, of critical importance. Information on WMD and information on US personnel being held by threat forces are normally considered hot leads even if not listed as requirements. The HUMINT collector will normally question the source immediately on a hot lead, unless he is already asking questions on another topic. In this case, he completes questioning and reports the information on the priority topic, as appropriate, and then immediately questions on the hot lead. As soon as the HUMINT collector is sure he has obtained and recorded all the details known to the source, he reports the hot lead information by the

most expedient means available, normally in SALUTE report format. The HUMINT collector then resumes his questioning of the source at the point where the hot lead was obtained.

COLD LEADS

9-22. A cold lead is a statement made by a source either spontaneously or in response to questioning that indicates he has information on a topic of interest other than the one currently under discussion but that would not answer PIRs. The HUMINT collector makes note of the cold lead and exploits it after the planned questioning objectives have been satisfied or at the appropriate time during the questioning sequence.

DETECTING DECEIT

9-23. HUMINT information often has the capability to be more accurate and reliable than other disciplines. SIGINT information, for example, is not always able to return to the original source of the information to determine the reliability of the information, and interpretation of IMINT information may be uncertain. However, while HUMINT can be reviewed for reliability, determining the reliability of human sources is a continuous process accomplished by carefully assessing not only the sources of information but also assessing the information itself.

9-24. Detection of deception is not a simple process, and it normally takes years of experience before a HUMINT collector can readily identify deliberate deceit. Inconsistencies in the source's actions or words do not necessarily indicate a lie, just as consistency is not necessarily a guarantee of the truth. However, a pattern of inconsistencies or unexplainable inconsistencies normally indicate deceit.

TECHNIQUES FOR IDENTIFYING DECEIT

9-25. Techniques for identifying deceit include but are not limited to the following:

- Repeat and control questions (see paras 9-9 and 9-10).
- Internal inconsistencies. Frequently when a source is lying, the HUMINT collector will be able to identify inconsistencies in the timeline, the circumstances surrounding key events, or other areas within the questioning. For example, the source may spend a long time explaining something that took a short time to happen, or a short time telling of an event that took a relatively long time to happen. These internal inconsistencies often indicate deception.
- Body language does not match verbal message. An extreme example of this would be the source relating a harrowing experience while sitting back in a relaxed position. The HUMINT collector must be careful in using this clue since body language is culturally dependent. Failing to make eye contact in the US is considered a sign of deceit while in some Asian countries it is considered polite.
- Knowledge does not match duty position or access. Based on the source's job, duty position, or access the HUMINT collector should have

developed a basic idea of the type and degree of information that an individual source should know. When the source's answers show that he does not have the expected level of information (too much or too little or different information than expected), this may be an indicator of deceit. The HUMINT collector needs to determine the source of unexpected information.

- Information is self-serving. Reporting of information that is self-serving to an individual or his group should be suspect. For example, a member of one ethnic group reporting generic atrocities by an opposing ethnic group or a source reporting exactly the right information needed to receive a promised incentive should be suspect. That is not to say that the information is necessarily false, just that the HUMINT collector needs to be sure to verify the information.
- Lack of extraneous detail. Often false information will lack the detail of truthful information, especially when the lie is spontaneous. The HUMINT collector needs to ask follow-up questions to obtain the detail. When the source is unable to provide the details that they should know, it is an indicator of deceit. If the source does provide this additional information, it needs to be checked for internal inconsistencies and verified by repeat questions.
- Repeated answers with exact wording and details. Often if a source plans on lying about a topic, he will memorize what he is going to say. If the source always relates an incident using exactly the same wording or answers repeat questions identically (word for word) to the original question, it may be an indicator of deceit. In an extreme case, if the source is interrupted in the middle of a statement on a given topic, he will have to start at the beginning in order to "get his story straight."
- Source appearance does not match story. If the source's physical appearance does not match his story, it may be an indication of deceit. Examples of this include the source who says he is a farmer but lacks calluses on his hands or the supposed private who has a tailored uniform.
- Source's language usage does not match story**.** If the type of language, including sentence structure and vocabulary, does not match the source's story, this may be an indicator of deceit. Examples of this include a farmer using university level language or a civilian using military slang.
- Lack of technical vocabulary. Every occupation has its own jargon and technical vocabulary. If the source does not use the proper technical vocabulary to match his story, this may be an indictor of deceit. The HUMINT collector may require the support of an analyst or technical expert to identify this type of deceit.
- Physical cues. The source may display physical signs of nervousness such as sweating or nervous movement. These signs may be indicators of deceit. The fact that an individual is being questioned may in itself be cause for some individuals to display nervousness. The HUMINT collector must be able to distinguish between this type of activity and nervous activity related to a particular topic. Physical reaction to a

particular topic may simply indicate a strong emotional response rather than lying, but it should key the HUMINT collector to look for other indicators of deceit.

- Failure to answer the question asked. When a source wishes to evade a topic, he will often provide an answer that is evasive and not in response to the question asked. For example, if the source is asked, "Are you a member of the insurgent organization?" and he replies, "I support the opposition party in the legislature," he has truthfully answered a question, but not the question that was asked. This is a subtle form of deceit since the source is seemingly cooperative but is in fact evading providing complete answers.

ACTIONS UPON IDENTIFYING INDICATORS OF DECEIT

9-26. The exact actions by the HUMINT collector when identifying possible deceit are dependent on the type of collection, the circumstances of the collection, the specific sign of deceit observed, the type of approach used, and cultural factors. The HUMINT collector may—

- Question the topic in more detail looking for additional indicators.
- Reinforce the approach.
- Move to another topic and revisit the original topic later with repeat questions. Ask control questions (confirmed by known data) and questions to which the source should know the answer to see if he answers honestly.
- Point out the inconsistency to the source and ask for an explanation.
- Seek assistance from a more experienced HUMINT collector, analyst, or a technical expert on the culture or the topic being questioned.
- Conduct continuous assessments of source (see FM 34-5 (S//NF)).
- Research established databases.
- Ask yourself if the information makes sense; if not, conduct more research.
- Consider how the information was obtained.
- Compare the information provided to the source's placement and access.
- Compare answers with other sources with similar placement and access. Be aware that this method is merely a rough tool to check veracity and should not be used by the collector to confirm intelligence.
- Use the polygraph.
- Consider that a source motivated primarily by money will likely be tempted to fabricate information in order to get paid.
- Be aware that a source may read the local newspaper to report information that is already known or may also be providing information to another agency.

9-27. The one thing that the HUMINT collector cannot do is to ignore signs of deceit.

HUMINT COLLECTION AIDS

9-28. There are numerous procedural and recording aids that can assist the HUMINT collector in conducting rapid, accurate, yet systematic questioning. They include—

- HUMINT Collector's Guide. This guide is a pamphlet or notebook designed to guide the HUMINT collector through the questioning. The HUMINT team leader should ensure that team members prepare a HUMINT collector's guide, which could be included in the unit's SOP. The guide is made based on the AO and supported command intelligence requirements. The HUMINT collector and available intelligence analysts should jointly prepare the guide. Appendix G provides the basic topics and example questions that can be adapted to construct a HUMINT collector's guide. The guide must be updated for each interrogation as part of planning and preparation. The guide should contain information such as—
  - Intelligence requirements and ISR tasks.
  - Topical questioning sequence format.
  - Actual prepared questions to be used during questioning.
  - Guidelines for employing the various approach techniques.
  - Formats or samples of completed reports used by HUMINT collectors.
- Time Event Chart. A timeline, or event chart, is a graphic display upon which the HUMINT collector enters chronological information as it is collected. This facilitates the HUMINT collector in understanding and organizing the collected information. It also enables the HUMINT collector to identify gaps in information, to sequence events properly to facilitate follow-up questions, and to identify deception. The HUMINT collector can develop a basic timeline prior to questioning. The source should not be able to observe the timeline since doing so will help a deceptive source "keep his story straight." See Chapter 12 for how to create and use a time event chart.
- Organizational Chart. An organizational chart is a graphic representation of an organization. It is the equivalent of a military line-and-block chart. This is used to facilitate the questioning of organizations and in establishing their hierarchical and lateral linkages. A basic chart can be developed prior to the questioning based on the expected organizational questioning.

RECORDING TECHNIQUES

9-29. Accuracy and completeness are vital principles to reporting. However, it is usually not possible to completely record all information in a questioning session. Recording techniques may involve memory, handwritten or typed notes, tape recordings, and video recordings. Each has its advantage and corresponding disadvantage.

- Memory: Relying on one's memory has certain advantages. It does not require any equipment or extra time, and is the least intrusive method of recording information. It allows maximum interaction with the source and projects sincerity. An individual can train himself to

remember highly detailed information. Often in elicitation, memory is the only viable recording method. However, in general, using the memory exclusively to record information is the most inaccurate methodology. Particularly in a long questioning session, details are forgotten and information tends to be generalized.

- Handwritten notes: Handwritten notes require minimal equipment (a pad and pencil), are not intimidating to most sources, and can be as detailed as the HUMINT collector desires. If an analyst or second interrogator is present, he should also take notes. This second set of notes can aid in report writing. The interrogator should not rely solely on an analyst's notes unless absolutely necessary. However, writing notes while questioning an individual often interferes with the rapport between the collector and the source. The collector loses eye contact and can easily miss subtle body language that might indicate lying. Detailed note taking can be extremely time consuming and many sources will, over time, begin to limit their responses so they do not have to repeat information or wait for the collector to write it down. It is somewhat intrusive and inhibiting to the source and is totally inappropriate in certain situations such as liaison and most casual source contacts. Handwritten notes can also be inaccurate, have limited details, and can be hard to read after the fact.
- Computer notes: With the proliferation of computer equipment, particularly laptops and handheld devices, note taking on computers is increasingly commonplace. A computer can provide access to data-based information that may support questioning such as foreign language dictionaries or technical support manuals, either through the Internet (if connected) or on its harddrive. If the computer is linked to a communications system, it also allows the HUMINT collector to transmit data, including SALUTE reports, during the course of the questioning. Notes taken on a computer, however, have many of the same disadvantages as handwritten notes. In addition, computer notetaking requires more equipment and technological support and access to either electricity or a plentiful supply of batteries. Computers may be intimidating to some sources and the fact that what the source says is being entered into a computer may cause the source to alter the information he is providing. Computers tend to isolate the collector from the source by dividing the collector's attention between the computer and the source, and again may cause the collector to miss critical body language clues. Finally, the computer is even more inappropriate to casual and controlled source operations than are handwritten notes.
- Audiotapes: If recording equipment is discrete and functioning properly, audiotapes can be extremely accurate. Use of tapes also allows the HUMINT collector to place his entire attention on the source. This not only enhances rapport but also allows the HUMINT collector to observe the source's body language. Taping a questioning session, if done overtly though, tends to be extremely inhibiting to the source and may seriously curtail the information obtained. Surreptitious taping can be illegal in some situations and dangerous in some situations as well. Consult your legal advisor to determine if

taping is legal. Taped information can also be seriously affected by ambient noise and the relative positioning of the source and collector to the microphone. Writing a report based on a taped session can be extremely time consuming, since it takes as long to listen to a tape as it took to record it. This drawback can be reduced somewhat through the use of voice activated recording devices. Exclusive dependence on audiotapes tends to make the collector less attentive and more likely to miss follow-up questions. Also, if the tape is lost or damaged or does not function properly, the collector has no backup.

- Video recording: Video recording is possibly the most accurate method of recording a questioning session since it records not only the voices but also can be examined for details of body language and source and collector interaction. It is also the most resource intensive requiring proper lighting, cameras, viewing equipment, and possibly trained operators. If done overtly, video recording can be by far the most inhibiting to the source. Even if the source is willing to be videotaped, there is a tendency for both the source and the collector to "play to the camera," creating an artificiality to the questioning. Consult your legal advisor to determine the legality of overt or covert videotaping.

QUESTIONING WITH AN ANALYST OR A TECHNICAL EXPERT

9-30. The HUMINT collector may often find himself in the position where he needs to use an analyst or a technical expert, or both, in order to conduct questioning. Many of the techniques involved in using an analyst or technical expert are the same as those with using an interpreter (see Chapter 11). The HUMINT collector must pre-brief these supporting personnel. The degree to which the analyst or technical expert is involved in the actual questioning is dependent on the established relationship between the analyst or technical expert and the HUMINT collector. The HUMINT collector will always remain in charge of the questioning, be present throughout the questioning, and ensure that the questioning follows his questioning plan. He must ensure that the supporting analyst or technical expert has the proper security clearance.

9-31. An analyst or technical expert can participate in the questioning to various degrees listed below from least intrusive to most intrusive. As the degree of participation by the analyst or technical expert increases, the technical fidelity of the information collected usually increases but the rapport between the HUMINT collector and the source decreases as does the HUMINT collector's ability to control the content and judge the truthfulness of the information. The analyst or technical expert may provide—

- Advice Only: The HUMINT collector does the questioning. The expert provides information prior to the meeting and may review the collected information after the meeting. The technical expert is not present at the actual questioning.
- Remote Support: The HUMINT collector does the questioning. In addition to the above, the expert monitors the questioning and provides input to the HUMINT collector after the questioning as required. Based on the technological support, this can involve the expert sitting in on, but not participating in the questioning (which

may make the source uncomfortable), or the expert viewing and listening to the questioning through a remote video and sound hook-up.

- Local Support: The HUMINT collector does the questioning. The expert sits in on the questioning and provides input to the HUMINT collector during the course of the questioning. This can break both the source's and the HUMINT collector's trains of thought and confuse the lines of control in the questioning.
- Expert Participation: The HUMINT collector initiates the questioning, but the expert participates throughout the questioning, asking for clarification and additional information as required. Unless properly trained, the expert can seriously taint the quality of the information through the use of poor questioning techniques. The HUMINT collector can lose rapport and control.
- Trained Expert Questioning: In rare instances, with particularly difficult technical topics or those areas of questioning that require a high degree of technical expertise, it may be easier to train the expert in basic questioning techniques than it is to train the HUMINT collector on the technical topic. In this instance, the HUMINT collector sits in on the questioning to ensure proper procedures and techniques are used and to advise the technical expert. The technical expert does most of the questioning.

9-32. In any case, if the source is to receive compensation for his time, it must come from the HUMINT collector, not the analyst or technical expert. This continues to reinforce that the HUMINT collector is in charge, and does not transfer the source's trust to the expert.

THIRD-PARTY OFFICIAL AND HEARSAY INFORMATION

9-33. The source may have information that he did not observe firsthand. While this information is not as reliable as firsthand knowledge, it is often significant enough to report. The HUMINT collector must be careful to identify this information as to its origin, type, and the time and manner that the information was obtained by the source. This information will be entered into the report as a source comment or a collector comment. This will include—

- The origin of the information. This may be the name, rank, and duty position or job of an individual or may be an official or unofficial document such as an OPORD, official memorandum, or party newspaper.
- The complete organization to which the person who provided the information belongs or the identity of the organization that produced the official or unofficial document from which the source obtained the information.
- Date-time group (DTG) when the source obtained the information.
- The circumstances under which the source obtained the information.

9-34. Comparing the details of the hearsay information, such as DTG, where the information was obtained and the circumstances under which the source

claimed to have received it, to the source's known activities, may provide indications of truthfulness or deception on the part of the source.

CONDUCTING MAP TRACKING

9-35. Map tracking is a specific questioning skill that the HUMINT collector uses in all operations. It is a vital skill in supporting targeting and operational planning. Map tracking identifies and verifies key information by tracking the source's movement and activities within a specific area over a fixed period using a map or similar graphic aid. The area and the time involved are dependent on the collection requirements and the source's knowledge level. Map tracking can occur at any point in the questioning process. Normally, the HUMINT collector begins map tracking as soon as his questioning identifies a priority disposition or activity that the source's information can locate on the map.

9-36. Map-tracking techniques, if properly applied, can extract information from friendly, neutral, or threat sources and can be used with individuals ranging from those with detailed map skills to illiterates, and those who have never seen a map. Through map tracking, the HUMINT collector pinpoints locations of any threat activity, threat dispositions, or any other priority terrain-related information, such as trafficability, known to the source.

9-37. The HUMINT collector will determine these locations with the degree of fidelity needed to support operational requirements. The degree of detail needed may range from an 8-digit grid coordinate for unit locations to locations of specific buildings, rooms, or even items within a room. The HUMINT collector uses a variety of map-tracking aids including standard military maps, aerial photographs, commercial imagery, building blueprints and diagrams, and commercial road maps. Some advantages to map-tracking techniques include—

- The source is led through his memory in a logical manner.
- Discrepancies in the source's statements are easier to detect.
- Locations are identified to support targeting and battlefield visualization.
- Map tracking is a four-step process:
  - Step 1: Determine the source's map-reading skills.
  - Step 2: Establish and exploit common points of reference (CPRs).
  - Step 3: Establish routes of travel.
  - Step 4: Identify and exploit key dispositions.

DETERMINE THE SOURCE'S MAP-READING SKILLS

9-38. The first step in the map-tracking process is to determine the specific map-reading skills of the source. This step only occurs the first time that the HUMINT collector map tracks a particular source. This information will determine what methodology will be used for the rest of the process. In this step the HUMINT collector is determining existing skills; he should not attempt to teach the source additional map skills at this time. The HUMINT collector can use prior knowledge, such as the fact that the source is illiterate or cannot read a map, to skip some of the specific parts of the process. Below

is a detailed description of the process to establish the map-reading skills of the source.

- The HUMINT collector asks the source if he can read the map being used. If the source answers in the affirmative, the HUMINT collector asks some key questions to verify this.
- If the source cannot read the map being used, the HUMINT collector determines if the source can read another type of available map or graphic representation. For example, a source may not be able to read a military map but might be able to use a commercial map or an imagery product.
- The HUMINT collector then establishes the method that will be used to describe movement (direction and distance) on the map. If the source knows how to use compass directions, that may be the most expedient method for determining direction. Again, the HUMINT collector must verify that the source knows how to use compass directions. This can be done best by having the source tell the compass directions between known points. Distance is normally determined by using the standard units of measurement with which the source is familiar, such as kilometers or miles. This can cause some problems, for example, if the map is measured in kilometers and the source normally expresses distance in miles. The HUMINT collector must make the adjustment rather than trying to teach the source the unfamiliar system.
- Compass directions and standard units of measure are not the only method or necessarily even the best method of indicating direction and distance in all circumstances. When using an urban map, direction and distance can often be described by indicating blocks traveled and turns made (right or left) at intersections. Direction of travel can be indicated in reference to key features such as going toward the downtown area or moving toward the river. When describing the interior of a building, references may be to upstairs, downstairs, floor number, or other descriptive terms. When map tracking in rural areas, especially when questioning someone who does not know how to use compass directions, terrain association is normally the best method of establishing direction of travel and distance. Questions such as "Were you traveling uphill at that time?" "What prominent terrain features could you see from that location?" "What was the nearest town?" or "Was the sun behind you?" help to identify locations on the map. The HUMINT collector should allow the source to use his own frames of reference. However, the HUMINT collector must ensure he understands the source.

ESTABLISH AND EXPLOIT COMMON POINTS OF REFERENCE

9-39. The second step of map tracking is to establish CPRs. It is important in accurate map tracking to talk the source through his past activities in the sequence in which they occurred and his movements in the direction in which they were traveled. Attempting to track a source backward in time and space is time consuming, inaccurate, and is often confusing to both the source and the HUMINT collector. Future activities should be tracked in the direction in

which they are planned to occur. The HUMINT collector will normally establish various CPRs throughout the questioning of the source.

9-40. For certain sources such as friendly forces, tasked sources, or other instances where the starting and ending points of the mission being questioned are easily established, the first point of reference is normally where that source began the mission. For other sources such as detainees, line crossers, informers, and refugees, it is often more difficult to establish a "starting point." In these instances the HUMINT collector uses a sequential approach to the map tracking. He establishes a point of reference that is a logical end point for the subject being discussed. This may be, for example, the point of capture for a detainee, the point where a line crosser entered the friendly force area, or where a refugee left the area of intelligence interest. Second and subsequent points of reference are established during questioning when the source mentions a disposition, activity, or location of interest that can be located on the map. The HUMINT collector locates the reference point on the map through direct questioning and terrain association. He uses leading questions as necessary to establish an exact location. He then establishes the route of travel.

ESTABLISH ROUTES OF TRAVEL

9-41. Once the CPR is established, the HUMINT collector questions the source until he has extracted all pertinent information on the CPR and its immediate surroundings. For past missions and activities, the HUMINT collector then establishes the route the source traveled between the newly established CPR and a previously established CPR and exploits the route. For future missions or activities, the route is established from the previously established CPR toward the future mission CPR.

9-42. The HUMINT collector should establish the route traveled by determining the source's direction and physical description of the route of travel. The description should include details such as surface on which the source traveled and prominent terrain features along the route of travel and the distance the source traveled or, in the case of future locations, would travel. The HUMINT collector should also identify any pertinent dispositions or any activities of military significance, belonging to the opposition forces, along or in the vicinity of the route of travel. For longer routes, the HUMINT collector may divide the route into segments for ease of questioning.

IDENTIFY AND EXPLOIT KEY DISPOSITIONS

9-43. The HUMINT collector must obtain the exact location and description of every pertinent disposition known to the source. This includes the locations established as CPRs and any other pertinent disposition established during map tracking. At a minimum, the collector should—

- Establish a physical description of the disposition. The degree of fidelity will depend on the collection requirements. This may be as detailed as the physical layout of a room to the general description of a training area. This will include security measures and modus operandi at the location as appropriate.

- Identify and describe the significance of the disposition in terms of ongoing and future threat operations.
- Identify and describe key activities, equipment, or organizations at the location, as well as people and leaders.
- Identify and describe all pertinent collocated activities, locations, or organizations, as well as people and leaders.
- Identify the basis (hearsay or personal experience) and DTG of the source's knowledge of each disposition.

SPECIAL SOURCE CATEGORIES

9-44. Questioning of every source is unique and requires specific preparation. Special consideration and preparation must be made for some specific categories of sources. Some examples of special source categories include but are not limited to wounded or injured sources or illiterates.

WOUNDED OR INJURED SOURCES

9-45. HUMINT collectors may question (interrogate, debrief, or elicit information from) a wounded or injured source provided that they obtain certification from a competent medical authority that the questioning will not delay or hinder medical treatment or cause a worsening of the condition of the source. The HUMINT collector can question the source before, after, or during medical treatment. The HUMINT collector cannot at any time represent himself as being a doctor or any other type of medical personnel or member of the ICRC. Nor can he state, imply, or otherwise give the impression that any type of medical treatment is conditional on the source's cooperation in answering questions.

ILLITERATES

9-46. HUMINT collectors should never make the mistake of equating illiteracy with a lack of intelligence or an inability to provide meaningful information. In fact, many illiterates have developed extremely good memories to compensate for their inability to rely on the written word. An illiterate's frame of reference does not include street signs, mile markers, and calendars. It also will probably not include conventional time and distance measurements. The HUMINT collector must compensate for these differences. Map tracking, for example, must normally be accomplished by terrain association. If the source cannot tell time, time of day can be determined by the position of the sun.

Chapter 10

Reporting

10-1. Reporting is the final and in many cases the most vital phase in HUMINT collection. If the collected information is not reported accurately, in a timely manner, in the proper format, and to the correct recipient, it cannot become part of the all-source intelligence product or tip in time to affect operational decisions. Information that would support targeting must be reported by the fastest means possible.

REPORTING PRINCIPLES

10-2. The HUMINT collector must be able, in a written report, to convey to the user the information obtained from a source. Therefore, the following principles of good report writing are to be followed:

- Accuracy. Accurately reflect the information obtained from the source. Reporter comments and conclusions must be clearly identified as such.
- Brevity. Report all relevant information; however, the report should be brief, to the point, and avoid unnecessary words.
- Clarity. Use simple sentences and understandable language. Proper grammar and punctuation are a must. Another team member, if possible, should read the reports to ensure clarity.
- Coherence. Present the information in a logical pattern based on standard reporting formats.
- Completeness. Report all information collected. The collector should not filter information since all information is of interest to an analyst. Report negative responses to pertinent topics to prevent a misunderstanding or duplication of effort in subsequent questioning based on SDRs.
- Timeliness. Report information as soon as operationally feasible. Most collection requirements contain a LTIOV as part of the requirement. While written reports are preferable, critical or time-sensitive information is passed by the most expedient means available.
- Releasability. Include only releasable information in reports that are to be shared with multinational units. When possible, reports to be shared with multinational units should be kept to the appropriate classification to ensure the widest dissemination of the reported information.

REPORT TYPES

10-3. There are two major categories for reporting information: operational reports and source administrative reports. Figure 10-1 shows the HUMINT

reporting channels. Refer to DIAM 58-11 (S//NF) and DIAM 58-12 (S//NF) for specific guidance in using these reports.

OPERATIONAL REPORTS

10-4. Operational reports is a broad category that encompasses all reports that do not contain information collected in response to intelligence requirements or the reporting of the technical, and usually sensitive, aspects of HUMINT collection. It includes but is not limited to all administrative and logistical reports. Unit SOPs and directives from higher headquarters establish operational reporting requirements, formats, and procedures. Operational reporting—

- Tells the commander where and when assets are conducting missions.
- Describes unit mission capability.
- Responds to administrative and logistical requirements.
- Describes support requirements.
- Includes but is not limited to unit status reports, mission planning reports, mission status reports, and equipment status.
- Reports ICF usage at any echelon where the use of ICFs is authorized.

SOURCE ADMINISTRATIVE REPORTS

10-5. Source administrative reports include intelligence reports that are used to pass or request information in order to answer intelligence requirements, and reports that address the HUMINT collector's contacts with the source. Intelligence reports include but are not limited to IIRs and SALUTE reports.

Intelligence Information Reports

10-6. The IIR is used to report all HUMINT information in response to collection requirements. It is used to expand on information previously reported by a SALUTE report or to report information that is either too extensive or not critical enough for SALUTE reporting. IIRs are written at any echelon and "released" by the appropriate authority before they enter the general Intelligence Community. Normally the G2X will be the release authority for IIRs.

10-7. At the tactical level, the HUMINT collectors will fill out the complete IIR; however, the requirements section may link the information collected against a unit requirement rather than against national requirements. In any case, the report will be forwarded to the OMT.

10-8. The team leader will review the IIR, place a copy of the IIR in the detainee's or source's local file and forward the IIR to the OMT. (When a detainee is transferred to another facility or evacuated to a higher echelon, a copy of each IIR written from interrogations of that detainee is forwarded with him.) The OMT reviews the report, requests additional information as necessary from the originator, adds additional administrative detail, and forwards the report to the HOC of the supporting C/J/G/S2X. The HOC and the 2X review the report, request additional information as required, add any

final required information including linking it to national requirements, and then the 2X releases the report.

10-9. In addition to the above, the text information from the IIR can be forwarded to the unit's analytical elements and when it contains critical time-sensitive information, such as an impending attack, it is sent to units which may be affected by the information; however, it must be clearly marked "unevaluated information, not finally evaluated intelligence." The use of IIRs and the formats are covered in DIAM 58-12 (S//NF).

SALUTE Reports

10-10. The SALUTE report is a standard Army format used to report information of immediate interest by individuals at any echelon. (See Appendix H for a SALUTE report format.) The SALUTE report is the primary means used to report combat information to units that could be affected by that information. After review by the team leader, SALUTE reports are sent simultaneously to the supported unit S2, to the OMT in control of the HCT, and to the intelligence staff officer of any other tactical unit that may be affected by the information contained in the SALUTE report.

10-11. The OMT reviews the report and forwards it to the supporting HAT and supporting J/G/S2X for inclusion in the analysis picture. The supported S2 will—

- Review the information.
- Incorporate it into his unit intelligence products, as applicable.
- Forward the information to his higher echelon intelligence staff officer.
- Ensure that all affected units are notified.

10-12. Units must develop SOPs for the passing of information and intelligence to multinational units. Report writers and editors must ensure that reports that are to be shared with multinational units contain only releasable information. This will enable reports to have the widest dissemination. Arrangements are made through the C/J2X/LNO for distribution. When possible, reports to be shared with multinational units should be kept to the appropriate classification to ensure the widest dissemination of the reported information.

Basic Source Data Reports

10-13. The basic source data (BSD) reports provide the HUMINT chain with biographic and operational information related to a source. BSDs are used at all echelons to collect biographic information on all contacts. The use of BSDs and BSD formats are covered in DIAM 58-11 (S//NF).

Contact Reports

10-14. Collectors use contact reports to inform their technical chain (from OMT through J/G/S2X) of all relevant information concerning specific meetings with HUMINT sources. Information typically includes the circumstances of the contact (purpose, locations, time), the operational

matters relative to the contact (topics discussed, taskings given), reports produced as a result of the contact, and logistics expended.

Other Reports

10-15. HUMINT collectors also use a number of other reports to administer source contacts and to report information. Copies of the following reports should be maintained in the detainee's permanent file for future reference. HUMINT collectors will review these reports when planning additional collection activities; release committees or tribunals can use the reports to help evaluate if a detainee can be released or not. These reports include—

- Screening Reports. Screening reports are used to report BSDs, knowledge areas and levels, cooperation, vulnerabilities to approaches, and other relevant source information between HUMINT collectors. It is normally filled out either electronically or manually by the initial HUMINT collector to speak to a source. The screening report is normally forwarded electronically to higher echelon HUMINT collection organizations and other MI organizations that might have interest in the source. Higher echelon organizations may add information to the screening sheet extracted through subsequent screenings. Available digital screening reports contained in the HUMINT collector's mission support software (for example, BAT or CI/HUMINT Automated Management System [CHAMS]) should be used whenever possible to ensure rapid transfer of data. If screening reports have to be handwritten, the information collected should conform to theater requirements and local SOPs.
- Knowledgeability Briefs. The KB is used to inform the Intelligence Community of a source's full identity, past history, and areas of knowledge, as well as to set a suspense date for the submission of intelligence requirements. It is normally only used at the strategic and operational echelons. When completed, a KB will be classified at least Confidential in accordance with the DIA Classification Guide to protect the identity of the source. The use of KBs and the formats are covered in DIAM 58-11 (S//NF). See Figure 10-2 for an example of a short form KB that can be used for screening at all echelons, and can also be prepared and published like the full KB. This allows the entire intelligence community to see who is either in custody or to whom US intelligence has access so that SDRs can be issued to help focus the intelligence collection effort.
- Notice of Intelligence Potential (NIP). A NIP is used to inform the US Intelligence Community of the availability of a source of potential interest and to notify them of what agency has responsibility for questioning that source and where to forward questions and requests for information from that agency. The use of NIPs and the formats are covered in DIAM 58-11 (S//NF).
- Lead Development Report (LDR). The LDR is used to inform the HUMINT chain of ongoing operations directed toward a specific source. It notifies them as to what element spotted the potential source, the

current steps in assessing of the source, and the general information on the potential source.

- Interrogation Summary. An interrogation summary may be written to record relevant facts concerning the interrogation. The summary may include the attitude of the source; approach techniques that were tried and which ones were effective; incentives promised and whether or not they were delivered yet; recommended topics for further exploitation; and any other topics the HUMINT collector considers relevant. Local SOPs will dictate the use of the interrogation summary.
- Interrogation Plan. The interrogation plan is a report prepared by the HUMINT collector to organize his plan to approach and question a source. It lists collection objectives, approach techniques, preparation and liaison tasks, and interpreter usage plan. The interrogation plan also has approval blocks for interrogation supervisor approval of selected approaches and medical release for questioning. The last part of the form has termination, approach effectiveness, recommendations for further exploitation, and a summary of information obtained and reports expected to be published. Figure 10-3 is an example of an interrogation plan format.
- Termination Report. The termination report is used at all echelons to inform the technical chain of the termination of a contact relationship between a HUMINT collector and a source.
- Biographic Report. The biographic report is a formatted IIR used at all echelons to report information collected from one human source about another individual of actual or potential intelligence interest. The biographic report format is found in DIAM 58-11 (S//NF).

REPORTING ARCHITECTURE

10-16. There are three basic reporting channels (see Figure 10-1):

- The operational reporting chain consists of primarily the C2 elements for the HUMINT collection element. It includes the OMTs, unit commanders, and unit S3 and operation sections.
- The technical chain includes the OMTs, HOC, and the C/J/G/S2X, and in certain circumstances, the unit G2/S2s.
- The intelligence reporting chain includes the OMTs, HATS, C/J/G/S2Xs, and unit G2/S2s.

10-17. Many elements serve multiple and overlapping functions within the reporting architecture. Each element must be aware of its function within the architecture to ensure that information is disseminated expeditiously to the right place in the right format. This architecture should be established and published prior to implementation in order to avoid confusion.

OPERATIONAL REPORTING

10-18. Operational reporting is sent via the organic communications architecture (see Chapter 13). Operational reports are normally sent per unit SOP or based on direction from higher headquarters. HCTs normally send all

operational reports through their OMT to the command element of the unit to which they are assigned. If an HCT is attached, it will normally send its operational reports to the unit to which it is attached with courtesy copies to their assigned unit as required. If there is an administrative or logistics relationship established with the supported unit, HCTs that are in DS send the principal copy of all related administrative and logistic reports to the supported unit with a courtesy copy to their parent unit. If the HCT is operating in GS, a courtesy copy of operational reports should be forwarded to all affected unit commanders in the supported AO.

TECHNICAL REPORTING

10-19. Technical reporting includes the forwarding of source information and technical parameters of collection operations from lower to higher and the passing of tasking specifics, source information, technical control measures, and other information from higher to lower. Technical reporting is conducted through the technical chain that extends from the HCT through the OMT and Operations Section (if one exists) to the C/J/G/S2X.

INTELLIGENCE REPORTING

10-20. The key to intelligence reporting is to balance the need for accurate reporting with the need to inform affected units as quickly as possible. The J/G/S2 and MI commander are key to ensuring the right balance.

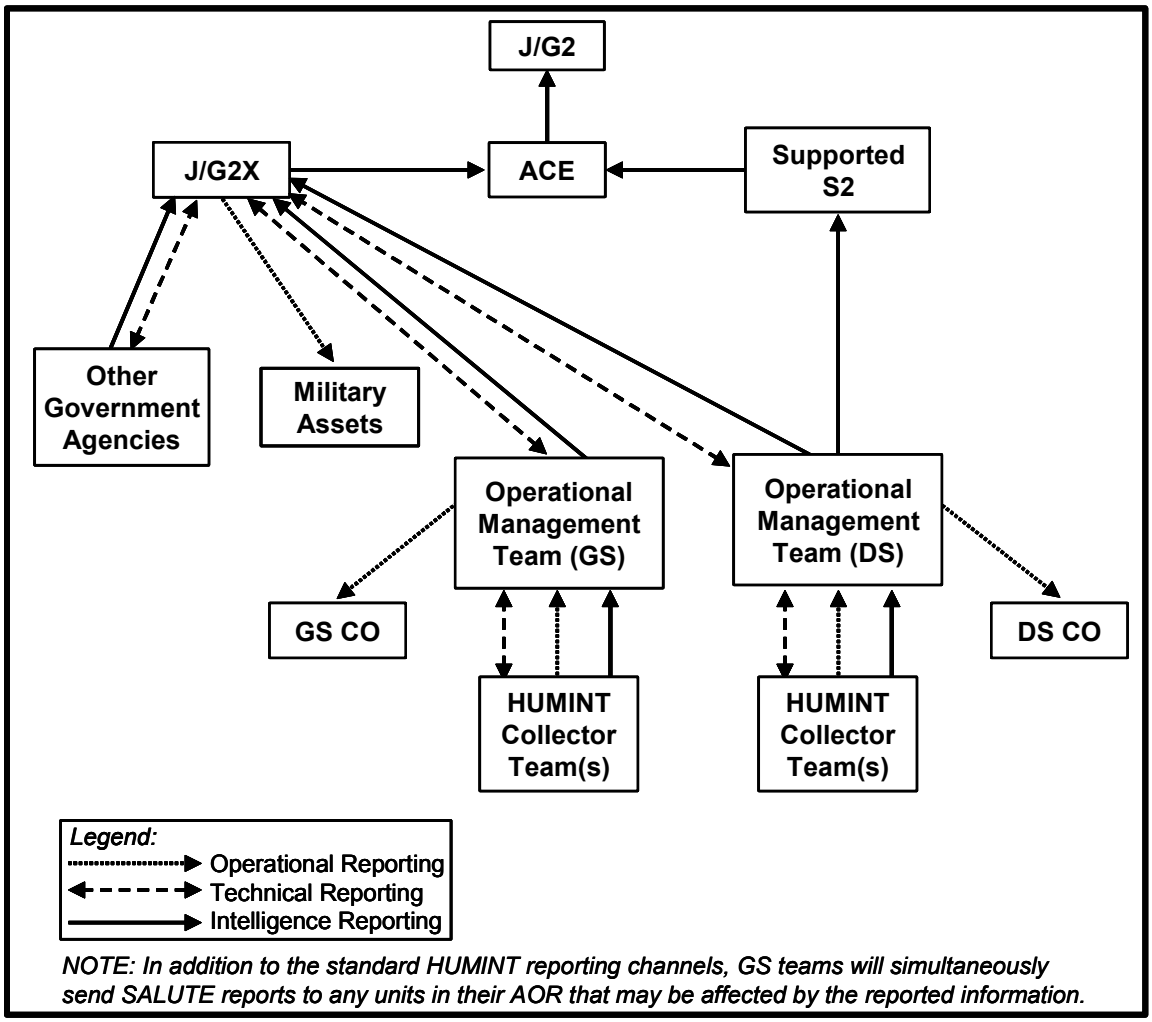

Figure 10-1. HUMINT Reporting Channels.

KB-EZ WORKSHEET

1. PERSONAL DATA:

1A. Name:

1B. Source Number (Capturing Unit):

1C. Source Number (MPs):

1D. Source Number (Other):

1E. Source Number (MI):

1F. Country of Citizenship:

1G. Birth City:

1H. Birth Country:

1I. Birth Date:

1K. Date Departed Country of Origin/Date of Capture:

1N. Last County of Residence:

1O. Language Competency:

2. Education: (Most Recent to Oldest)

Chapter 11

HUMINT Collection With An Interpreter

11-1. The use of interpreters is an integral part of the HUMINT collection effort. It is vital that the HUMINT collection skills be paired up with a qualified interpreter. Use of an interpreter is time consuming and potentially confusing. Proper use and control of an interpreter is a skill that must be learned and practiced to maximize the potential of HUMINT collection. It is also vital for the HUMINT collector to confirm that the interpreter he intends to use holds the required clearance for the level of information that will be discussed or potentially collected, and is authorized access to the detainee. This chapter deals strictly with the use of interpreters to support HUMINT collection; it is not intended to be applied to more routine uses of interpreters in support of administrative, logistical, or other operational requirements.

ADVANTAGES AND DISADVANTAGES OF INTERPRETER USE

ADVANTAGES

11-2. Interpreters are frequently a necessary aid to HUMINT collection. There are certain advantages to using an interpreter. The most obvious is that without an interpreter, a HUMINT collector without the proper language or necessary proficiency in that language is severely limited. Furthermore, if properly trained, briefed, and assessed, the interpreter can be a valuable assistant to the HUMINT collector. The interpreter—

- Probably has a greater knowledge of the local culture and language usage than could be developed by the HUMINT collector.
- Can identify language and culturally based clues that can help the HUMINT collector confirm or refute the veracity of the source's statements.
- Can interpret not only the literal meaning of a statement but also the intent and emotion of a sentence.

DISADVANTAGES

11-3. There are, however, several significant disadvantages to using interpreters. Disadvantages may include—

- A significant increase in time to conduct the collection. Since the interpreter must repeat each phrase, the time for a given questioning session or meeting is normally at least doubled.
- Since there is now a third person in the communications loop, the potential for confusion or misunderstanding increases significantly. This is especially true when the interpreter is deficient in his command of either language.

- The establishment of rapport and the use of some approach techniques (see Chapter 8) are made difficult or even impossible when working through an interpreter.
- The ability of the HUMINT collector to interpret the source's veracity through the analysis of word usage, nuances of speech, and body language is curtailed.
- The interpreter will have his own set of biases that could influence the manner in which the dialogue is interpreted.
- The source may be culturally biased against the interpreter. This is especially possible if the interpreter was locally hired and is of a different ethnic, social, or religious group than the source.
- The interpreter may be culturally biased against the source and intentionally misinterpret the meaning to obtain a desired effect.
- There may be mission or subject matter classification problems involved.

CAUTIONS

11-4. Be careful of comments made in the presence of your interpreter. Although you plan comprehensively with your interpreter, you should only share information with your interpreter on a need-to-know basis. Obviously the exchange of information concerning the "what, where, when, with whom, and how" of each meeting must be discussed with your interpreter, but sometimes the "real why" is none of his business! You may be meeting with a source or contact because the commander believes this individual has lied. The real purpose (the why) of the meeting is to pose control questions and to determine whether the source or contact lied in the past or whether there was simply a miscommunication.

11-5. Be careful of sensitive or personal conversations when the interpreter is present. This applies to conversations en route to or from meetings, conversations over lunch or dinner in the operational area, and conversations in the team area. It is easy to get used to the presence of the interpreter and to overlook his presence. An interpreter is a necessary tool but we must remember that most are only very lightly screened for the sensitive access they have. If your interpreter turned out to be working for the other side, what information beyond "the necessary" could he provide?

METHODS OF INTERPRETER USE

11-6. There is a basic method and advanced method of interaction between the HUMINT collector and the interpreter. As the collector and the interpreter become experienced at working together and gain confidence in each other's abilities, they may use more advanced interactive techniques. It is the HUMINT collector's decision whether or not to use more advanced techniques.

BASIC METHOD

11-7. The basic method of interaction is used when—

- The interpreter and HUMINT collectors have not worked together extensively.
- The interpreter has language skills but no interpreter training or experience.
- The interpreter's skill in English or the target language is suspect.
- The HUMINT collector has limited experience using an interpreter.
- The interpreter's capabilities, loyalty, or cultural knowledge are not known or suspect.

11-8. Using the basic method, the interpreter is used solely as an interpretation device. When initial contact is made, the interpreter instructs the source to maintain eye contact with the HUMINT collector. The interpreter is briefed on the general course of the collection but usually is not advised of the specific purpose or collection goals. While the interpreter will be instructed to reflect the attitude, behavior, and tone of voice of both the collector and the source, he is told to *not* interpose comments or personal opinions at all in the conversation.

11-9. The questioning phase is conducted in the same way it would be if no interpreter were used with the obvious increase in time due to the interpretation. The interpreter uses the same person and tense as the HUMINT collector or source and neither adds nor subtracts anything from the dialogue. He does his best to fade into the background. When reports are written, the interpreter will only be asked questions based on the actual translation of the dialogue.

ADVANCED METHOD

11-10. The advanced method of interaction requires additional training on the part of the HUMINT collector and the interpreter, extensive experience working together, and a rapport between the HUMINT collector and the interpreter. The HUMINT collector must trust both the capabilities and the judgment of the interpreter. At this level of interaction, the interpreter becomes a more active participant in the HUMINT activities. The HUMINT collector remains in charge and makes it clear to the interpreter that he (the HUMINT collector) is responsible for the substance and direction of the questioning. The interpreter is normally briefed as to the specific goals of the collection.

11-11. The interpreter becomes a more active participant in the approach and termination phases to the point of even making planned comments to the source supportive of the HUMINT collector's approach. For example, if the HUMINT collector is using an incentive approach, the interpreter in an aside to the source can tell him that the HUMINT collector always keeps his promises. This type of technique should only be used if both planned and rehearsed.

11-12. During the questioning phase, the interpreter supports the collector by not only translating the word of the source but also cueing the collector when there are language or culturally based nuances to what the source is

saying that might add credence or doubt as to the veracity of the statements. For example, the interpreter could point out that although the source claims to be a factory worker, his language use indicates that the source has a university education. In another example, the interpreter could indicate that the dialect or pronunciation that the source is using does not match the area that he claims to be from. During report writing, the interpreter supports the HUMINT collector by not only answering questions on the literal interpretation but also adds, when appropriate, comments on the significance of both what was said and how it was said.

SOURCES OF INTERPRETERS

11-13. There are almost never sufficient interpreters to meet all unit mission requirements. Interpreters in support of HUMINT collection require a security clearance and knowledge of the operational situation. While any qualified interpreter can be used to support HUMINT collection, the HUMINT collectors maximize the collection potential if the interpreter has received specific training. The number of interpreters needed to support a HUMINT collection mission is METT-TC driven based primarily on the number of HUMINT collectors, the dispersion of the HUMINT collectors in the AO, and the number of sources. Normally one interpreter for every two non-language qualified HUMINT collectors is sufficient; however, in situations where a large number of high-value sources must be questioned in a limited time, a ratio of 1 to 1 may be required. Interpreters are obtained from within the military and from the US and local civilian populations or other English-speaking countries.

MILITARY

11-14. There are many soldiers, including non-US citizens, who have native language abilities due to their upbringing. Their parent unit may identify these language abilities, or these soldiers may volunteer their abilities when a contingency arises. The ARNG, USAR, other US military services, and even coalition militaries, have language-trained and certified personnel in Military Intelligence MOSs, such as 98G or 09L, who may be called upon to serve as interpreters for the HUMINT collection effort.

CIVILIAN

11-15. Civilian corporations may be contracted by the military to provide interpreters for an operation. These interpreters are divided into three categories:

- CAT I Linguists - Locally hired personnel with an understanding of the English language. These personnel undergo a limited screening and are hired in-theater. They do not possess a security clearance and are used for unclassified work. During most operations, CAT I linguists are required to be re-screened on a scheduled basis. CAT I linguists should not be used for HUMINT collection operations.
- CAT II Linguists - US citizens who have native command of the target language and near-native command of the English language. These personnel undergo a screening process, which includes a national

agency check (NAC). Upon favorable findings, these personnel are granted an equivalent of a Secret collateral clearance. This is the category of linguist most used by HUMINT collectors.

- CAT III Linguists - US citizens who have native command of the target language and native command of the English language. These personnel undergo a screening process, which includes a special background investigation (SBI). Upon favorable findings, these personnel are granted an equivalent of a Top Secret (TS) clearance. CAT III linguists are used mostly for high-ranking official meetings and by strategic collectors.

INTERPRETATION TECHNIQUES

11-16. During the planning and preparation phase, the HUMINT collector, in collaboration with the interpreter, selects a method of interpretation. There are two methods:

- Alternate Interpretation. The interpreter listens to the entire phrase, sentence, or paragraph. The interpreter then translates it during natural pauses in speech.
- Simultaneous Interpretation. The interpreter listens to the source and translates what he says, just a phrase or a few words behind. The HUMINT collector should select the simultaneous method only if all the following criteria are met:
  - The sentence structure of the target language is parallel to English.
  - The interpreter can understand and speak English as well as the target language with ease.
  - The interpreter has special vocabulary skills for the topics to be covered.
  - The interpreter can easily imitate the HUMINT collector's tone of voice and attitude for the approaches and questioning technique selected.
  - Neither the collector nor the interpreter tends to get confused when using the simultaneous method of interpretation.

11-17. If any of the above-mentioned criteria in the simultaneous method cannot be met, the HUMINT collector should use the alternate method. The alternate method should also be used when a high degree of precision is required.

TRAINING AND BRIEFING THE INTERPRETER

11-18. The HUMINT collector will need to train an individual who has no interpreter experience as well as remind a trained and certified interpreter of the basic interpreter requirements. The requirements include—

- Statements made by the interpreter and the source should be interpreted in the first person, using the same content, tone of voice, inflection, and intent. The interpreter must not interject his or her own personality, ideas, or questions into the interview.

- The interpreter should inform the HUMINT collector if there are any inconsistencies in the language used by the source. The HUMINT collector will use this information in his assessment of the source.
- The interpreter needs to assist with the preparation of reports and administrative documents relevant to the source and meeting.

11-19. Once the HUMINT collector has chosen a method of interpretation, he must brief the interpreter. This briefing must cover—

- The current situation.
- Background information on the source (if available).
- The administrative particulars of the meeting such as where it will be held, the room setup, how long it will last.
- The specific positioning of the interpreter, collector, and source.
- The general or (if advanced method of interaction is being used) the specific collection objectives.
- The selected approach and possible alternate approaches that the HUMINT collector plans on using. If time allows, the collector and interpreter should rehearse the approaches.
- Any special topic or technical language that is anticipated. If time allows, the interpreter should research any anticipated technical vocabulary with which he is unfamiliar.

11-20. Throughout the briefing, the HUMINT collector fully and clearly answers questions the interpreter may have. This helps ensure the interpreter completely understands his role in the HUMINT collection process. With a more advanced interaction plan, the HUMINT collector and the interpreter should "wargame" their plan and rehearse their actions as necessary.

PLACEMENT OF THE INTERPRETER

11-21. The interpreter should be placed in a position that enhances the mood or general impression that the HUMINT collector wants to establish. When dealing with detainees or EPWs, the HUMINT collector generally wants to establish a dominant position, maintain a direct relationship with the source, and increase or at least maintain the anxiety level of the source. Having the HUMINT collector and the source facing each other with the interpreter located behind the source normally facilitates this. It allows the HUMINT collector to maximize control of both the source and interpreter. If desired, having the interpreter enter the room after the source, so the source never sees the interpreter, can further heighten the anxiety of the source.

11-22. Having the interpreter sit to the side of the HUMINT collector creates a more relaxed atmosphere. This is the norm for debriefings and official meetings. Having the interpreter at his side also facilities "off line" exchanges between the HUMINT collector and the interpreter. The collector should avoid having the interpreter sit beside the source since this has a tendency of establishing a stronger bond between the source and the interpreter and makes "off line" comments between the collector and the interpreter more difficult.

11-23. When conducting source meetings in a public setting, a more natural appearance is desirable. The seating needs to conform to the norm at the location where the meeting is taking place. For example, if meeting at a restaurant, the HUMINT collector, interpreter, and source will sit naturally around the table.

INTERACTIONS WITH AND CORRECTION OF THE INTERPRETER

11-24. The HUMINT collector must control the interpreter. He must be professional but firm and establish that he is in charge. During a questioning session, the HUMINT collector corrects the interpreter if he violates any standards that the pre-mission briefing covered. For example, if the interpreter interjects his own ideas into the meeting, he must be corrected. Corrections should be made in a low-key manner as to not alienate the interpreter, interrupt the flow of the questioning, or give the source the impression that there is an exploitable difference of opinion between the HUMINT collector and the interpreter. At no time should the HUMINT collector rebuke the interpreter sternly or loudly while they are with the source. The HUMINT collector should never argue with the interpreter in the presence of the source. If a major correction must be made, the HUMINT collector should temporarily terminate the meeting and leave the site temporarily to make the correction. The HUMINT collector needs to document any difficulties as part of his interpreter evaluation. The HUMINT collector must always ensure that the conduct and actions of the interpreter are within the bounds of applicable law and policy. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs.

11-25. The HUMINT collector must be alert for any signs that the interpreter is not performing as required. The following are some indicators of possible problems.

- Long-to-short. If you take 20 seconds to express yourself and the interpreter reduces it to a 3-second translation, it may indicate that something has been omitted, and you should not proceed until you have resolved the issue. There is nothing wrong with stating that you would "prefer" the interpreter translate everything that was just said. If you have trained your interpreter properly, this should not be an issue. If it arises even with the training you have given the interpreter, then it has significance and you must not let it pass.
- Short-to-long. If you take 5 seconds to express yourself and the interpreter expands it to a 30-second translation, it may indicate that something has been added, and you should not proceed until you have resolved the issue.
- Body-language shift. If the interpreter's body language suddenly has a significant shift from his normal behavior, you should look for the reason. (It is advisable for you to determine a base line of behavior for your interpreter to facilitate recognition of the changes.) Perhaps he is reluctant to translate what you just said. Be aware that the body shift

means that something is happening—your task is to find out what it means.

- Unusual pauses. Look for a longer delay than usual before the translation begins. Unless it is a vocabulary or concept issue, the long delay means that the interpreter is "thinking" before he translates. Any thinking beyond what is needed to translate, as closely as possible, what was just said represents a potential problem. Again, you should establish a base line of behavior for your interpreter so you can recognize these unusual pauses.
- "Wrong" reactions. If you say something humorous that should provoke a positive response from the source, and you do not get that response, then you should wonder if the message got through. If the source becomes upset in response to something (positive) you said, then you should begin to wonder what message was passed by the interpreter. Did you fail to express yourself clearly, or was it an accidental or deliberate mistranslation?

11-26. A trusted linguist should periodically review the accuracy of the interpreter's translations by monitoring an interrogation or debriefing and critiquing the monitored interpreter's performance.

INTERPRETER SUPPORT IN REPORT WRITING

11-27. The interpreter assists the HUMINT collector in preparing all required reports. He may be able to fill gaps and unclear details in the HUMINT collector's notes. He may also assist in transliterating, translating, and explaining foreign terms.

EVALUATING THE INTERPRETER

11-28. After submitting all reports, the HUMINT collector evaluates the performance of his interpreter. This should be done in writing, and copies should be given to the interpreter and placed on file with the individual managing the HUMINT collection portion of the interpreter program. The interpreter program manager needs to develop a standard evaluation format for inclusion in the unit SOP. The evaluation forms should note at a minimum:

- Administrative data (for example, date, time, interpreter's name).
- Strengths and weaknesses of the interpreter with any problems and corrective actions taken.
- Type of interpretation used (simultaneous or alternate).
- Type of HUMINT operation the interpretation was supporting (that is, an interrogation, a debriefing, a liaison meeting).
- Ability or lack of ability of the interpreter to use specific technical language that may have been required.
- Name or collector number of the HUMINT collector.

11-29. The interpreter program manager uses these forms to decide on future use of the interpreters, to develop training programs for the interpreters, and to assign interpreters to make maximum use of their specific capabilities.

The HUMINT collector should also review these files before using an unfamiliar interpreter.

MANAGING AN INTERPRETER PROGRAM

11-30. Units requiring interpretation support need to identify an individual or individuals to manage the interpreter program. In most units, this will be someone in the G3/S3 section. Division and Corps-level units will have a language manager. In MI units whose specific function is HUMINT collection, it will normally be a senior Warrant Officer within that unit. The functions of the interpreter program manager include but are not limited to—

- Consolidating and prioritizing interpreter requirements.
- Coordinating with G2 or INSCOM to contract for qualified interpreters.
- Coordinating with the G1/S1 to identify personnel in the unit with language skills who can be used as interpreters.
- Coordinating with the G1/S1 and G5 to obtain qualified local-hire interpreters.
- Coordinating with G2/S2 for clearances.
- Coordinating with the G3/S3 to establish training for both the interpreters and those that will be using interpreters.
- Coordinating with the G3/S3 for language testing of the interpreters in both English and the target language as required.
- Coordinating with the G1/S1 and G4/S4 to ensure that all administrative and logistical requirements for the interpreters are met.
- Establishing and maintaining the administrative, operational, and evaluation files on the interpreters.
- Assigning or recommending the assignment of interpreters to operational missions based on their specific capabilities.

PART FOUR

Analysis and Tools

Part Four discusses HUMINT analysis and the automation and communication tools needed to support the HUMINT collection effort.

HUMINT analysis supports operational planning and provides direction to HUMINT collection operations. Analysts determine if information from a single human source is internally consistent based on factors such as placement and access of source, prior information from the source, and existing holdings. Source analysis is used to determine if the information from a source is complete, truthful, and responsive to collection requirements. Operational analysis consists of those actions taken to determine how to best meet requirements.

Modern automation and communications systems are vital to HUMINT collection. Real-time collaboration, detailed operational planning and ISR integration, as well as enhanced collection and source exploitation tools, must support team efforts. Emerging technology continues to allow the entire HUMINT collection system to operate more effectively. Commanders must be prepared to supply their HUMINT collection assets with the best possible technology.

Chapter 12

HUMINT Analysis and Production

12-1. Analytical processes provide information to support the commander, his staff, and his unit. Analysis is an integral part of HUMINT collection. Analysis occurs throughout the HUMINT collection process but can be divided into four primary categories: analytical support to operational planning and targeting, operational analysis and assessment, source analysis, and single-discipline HUMINT analysis and production.

ANALYTICAL SUPPORT TO OPERATIONAL PLANNING

12-2. Several elements provide analytical support at various echelons, including the following:

- The HAT is subordinate to the G2 ACE. The HAT supports the G2 in developing IPB products and in developing and tailoring SIRs to match HUMINT collection capabilities.

- The HAC is subordinate to the C/J/G/S2X and functions in the same capacity for the C/J/G/S2X as the HAT does for the ACE.
- The HOC of the C/J/G/S2X supports the C/J/G/S2 and C/J/G/S2X in the identification of HUMINT collection opportunities, the development of taskings and RFIs for HUMINT collection assets, as well as the development of a HUMINT database.

INTELLIGENCE PREPARATION OF THE BATTLEFIELD

12-3. The HAT assists the G2 in the identification and characterization of the human component of operations and its effects on friendly and enemy operations. As part of its assistance to the G2, the HAT compiles and analyzes data about the local civilian population including its political, ethnic, religious, cultural, tribal, economic, and other social components. It carefully examines the various component groups and their predicted reaction to friendly force operations.

12-4. The HAT also provides input to all-source analysis by identifying specific actions and motivational factors that should strengthen the local population's support of the US or at least weaken its support of the enemy and by providing information on transient (refugees, DPs, third-country nationals) population and its effects on friendly and enemy operations. In addition to the above, the HAT—

- Closely examines the current and potential threat to identify all factors, such as morale, motivation, training, and beliefs that would affect both positively and negatively on enemy and opposing force capabilities.
- Identifies formal and informal leaders of hostile, neutral, and friendly groups and how their influence is likely to affect operations.
- Develops overlays, databases, and matrices, as required, to support IPB. These overlays may represent a wide variety of intelligence issues, including battlefield infrastructure (for example, electrical power grid), population density, ethnic, religious, or tribal affiliation, and no-strike or collateral damage.
- Provides its products to the C/J/G/S2, the all-source analysts and CI analysts of the ACE, the HOC, the C/J/G/S2X, and HUMINT collection units as required.

ISR TASK DEVELOPMENT

12-5. The HAT and the C/J/G/S2X support the C/J/G/S2 by expanding the PIRs that can be answered through HUMINT collection into ISR tasks that can be answered by a human source and that can be tasked to a specific collection entity. The HAT and the C/J/G/S2X provide this information to support the development of the HUMINT collection plan and its integration into the overarching ISR plan. The HAT normally establishes a list of prioritized standing indicators, and supplements this with ISR tasks developed to answer specific PIRs. The standing indicators are incorporated into the ACE's all-source analysis team's list of indicators that point to a pattern or COA. Each standing indicator is integrated with other indicators

and factors so that analysts can detect patterns and establish threat intentions.

SUPPORT TO HUMINT TASKING

12-6. The C/J/G/S2X supports the C/J/G/S2 and the C/J/G/S2 requirements manager by developing tasking for specific organic or attached HUMINT collection assets and by developing requests and coordinating for support from higher and lateral echelon HUMINT collection elements. The C/J/G/S2X matches specific collection requirements to collection units and sources. If current sources cannot answer the requirement, he develops profiles for new sources that guide the collection teams in the development of new sources. The C/J/G/S2X also determines the best method to achieve collection requirements. The C/J/G/S2X supplies any required technical support to the HUMINT operations section, OMTs, and HCTs.

HUMINT DATABASE DEVELOPMENT

12-7. The C/J/G/S2X maintains the source database, which receives input from HUMINT collection and CI operations. The C/J/G2X is responsible for maintaining the source database.

OPERATIONAL ANALYSIS AND ASSESSMENT

12-8. Operational analysis consists of those actions taken to determine how to best meet requirements. Assessment evaluates the effectiveness of the requirement effort. Operational analysis begins with the C/J/G/S2X when he determines the best collection assets and sources needed to answer collection requirements. For **analysis**, the C/J/G/S2X section and specifically the HOC—

- Provides higher echelon coordination and deconfliction for collection operations.
- Provides required technical support to the HUMINT operations sections, OMTs, and HCTs.
- Facilitates feedback and evaluations.

12-9. For **assessment**, the C/J/G/S2X section and specifically the HOC—

- Monitors all HUMINT reporting to ensure that requirements are being met.
- Refocuses efforts of assigned assets as needed.

12-10. The HUMINT operations section (if one exists) and the OMTs of tasked collection units determine which HCTs are best suited to meet specific collection requirements. They also conduct operational coordination for the HCT, provide technical support, and monitor all reporting to ensure that reports are properly formatted and support collection requirements. The team leader of the tasked HCT selects the specific collectors and sources to meet collection requirements, reviews the collection plan, provides technical support to the collectors, coordinates with the supported unit, and monitors all team reporting for format and content. He identifies additional lines of questioning and approaches required to fulfill collection requirements.

SOURCE ANALYSIS

12-11. Source analysis involves the actions taken to determine if information from a single human source is internally consistent based on factors such as placement and access of source, prior information from the source, and existing holdings. Source analysis is used to determine if the information from a source is complete, truthful, and responsive to collection requirements. Preliminarily source analysis is the responsibility of the individual HUMINT collector.

12-12. The HUMINT collector evaluates all source statements within the context of the information known about the source and the current situation to determine both the veracity and the validity of source statements. That is not to say that the HUMINT collector ignores any information that does not fit into expected pattern; rather that he treats that information with skepticism and uses appropriate questioning methodology to validate the statements (see Chapter 9). Source analysis is supported by the HCT leader, the OMTs, and the HOC. Each echelon reviews the intelligence and operational reports, identifies inconsistencies, evaluates veracity, and recommends additional lines of questioning as appropriate.

12-13. Analysts can assign an alphanumeric designator to collected information based on an analyst's determination of the reliability of the source and the probable accuracy of the information reported. A letter from A to F is assigned reflecting the level of reliability, with A representing the highest degree of reliability. The letter designation is then coupled with a number from 1 to 6. The number 1 represents confirmed intelligence and the numbers 2 through 6 represent increasing degrees of uncertainty as to the veracity of the information. A complete explanation if this rating system is contained in Appendix B. [NOTE: This system of labeling the reliability of sources and their reported information should not be confused with the alphanumeric rating scheme for source-screening operations as described in Chapter 6.]

SINGLE-DISCIPLINE HUMINT ANALYSIS AND PRODUCTION

12-14. Single-discipline HUMINT analysis involves the actions taken to evaluate the information provided by all HUMINT sources at a given echelon to determine interrelationships, trends, and contextual meaning. While called "single discipline," the analyst reviews and incorporates, as necessary, information from other disciplines and all-source analysis to provide a contextual basis for the HUMINT analysis. Single-discipline HUMINT analysis is conducted primarily by the HAT of the ACE. HUMINT operations sections and OMTs also conduct analysis to a lesser degree, based on the information from HUMINT sources at their echelon.

12-15. Analysis does more than simply restate facts. The analyst formulates a hypothesis based on available data, assesses the situation, and explains what the data means in logical terms that the user can understand. There are two basic thought processes used by analysts to study problems and reach conclusions: induction and deduction.

- Induction is the process of formulating hypotheses on the basis of observation or other evidence. It can best be characterized as a process of discovery when the analyst is able to establish a relationship between events under observation or study. Induction, or plausible reasoning, normally precedes deduction and is the type of reasoning analysts are required to perform most frequently.
- Deduction is the process of reasoning from general rules to particular cases. The analyst must draw out, or analyze, the premises to form a conclusion. Deductive reasoning is sometimes referred to as demonstrative reasoning because it is used to demonstrate the truth or validity of a conclusion based on certain premises.

ANALYTICAL TECHNIQUES AND TOOLS

12-16. There are three basic analytical techniques and automated tools that are particularly useful to single-discipline HUMINT analysis. Each of these tools takes fragmented bits of information and organizes them to create a chart or graph that can easily be read. They are the time event chart, matrices, and the link analysis diagram. HUMINT collectors and analysts can use automated computer programs such as Analyst Notebook or Crime Link to produce these tools or they can create them on paper. Computer programs are faster to use than previous methods and have the added advantage of producing a product that can be shared easily and rapidly over networks and portals. The diagrams in this chapter represent the tools that can be produced using automated programs.

Time Event Chart

12-17. A time event chart is a method for placing and representing individual or group actions in chronological form. It uses symbols to represent events, dates, and the flow of time. Normally, triangles are used to depict the beginning and end of the chart and may be used within the chart to indicate particularly critical events such as an ideological shift or change. Rectangles, used as event nodes, store administrative data and indicate significant events or activities. Drawing an "X" through the event node may highlight noteworthy or important events. Each of these symbols contains a sequence number, date (day, month, and year of the event), and may, if desired, contain a file reference number. The incident description written below the event node is a brief explanation of the incident and may include team size and type of incident. Arrows indicate time flow. By using these symbols and brief descriptions, it is possible to analyze the group's activities, transitions, trends, and particularly operational patterns in both time and activity. If desired, the event nodes may be color coded to indicate a particular event or type of event to aid in pattern recognition. The time event chart is the best analytical tool for pattern analysis. The example at Figure 12-1 depicts the history of the group, including most major players, which carried out the World Trade Center bombing in February 1993.

Matrices

12-18. Construction of a matrix is the easiest and simplest way to show the relationships between a number of similar or dissimilar associated items. The items can be anything that is important to a collection effort such as people, places, organizations, automobile license plates, weapons, telephone numbers, or locations. In analysis, matrices are often used to identify "who knows whom," or "who has been where or done what" in a clear concise manner. There are two types of matrices used in human analysis: the association matrix, used to determine existence of relationships between individual human beings, and the activities matrix, used to determine connectivity between individuals and any organization, event, address, activity, or any other non-personal entity. The graphics involved in constructing the two types of matrices differ slightly, but the principles are identical.

12-19. The association matrix (Figure 12-2) shows connections between key individuals involved in any event or activity. It shows associations within a group or associated activity. Normally, this type of matrix is constructed in the form of an equilateral triangle having the same number of rows and columns. Personalities must be listed in exactly the same order along both the rows and columns to ensure that all possible associations are correctly depicted. An alternate method is to list the names along the diagonal side of the matrix. This type of matrix does not show the nature, degree, or duration of a relationship, only that a relationship exists. The purpose of the matrix is to show the analyst who knows whom and who are suspected to know whom. In the event that a person of interest dies, a diamond is drawn next to his or her name on the matrix.

12-20. The analyst uses a dot or closed (filled-in) circle to depict a strong or known association. A known association is determined by direct contact between one or more persons. Direct contact is determined by several factors. *Direct associations* include—

- Face-to-face meetings.
- Telephonic conversations in which the analyst is sure who was conversing with whom.
- Members of a cell or other group who are involved in the same operations.

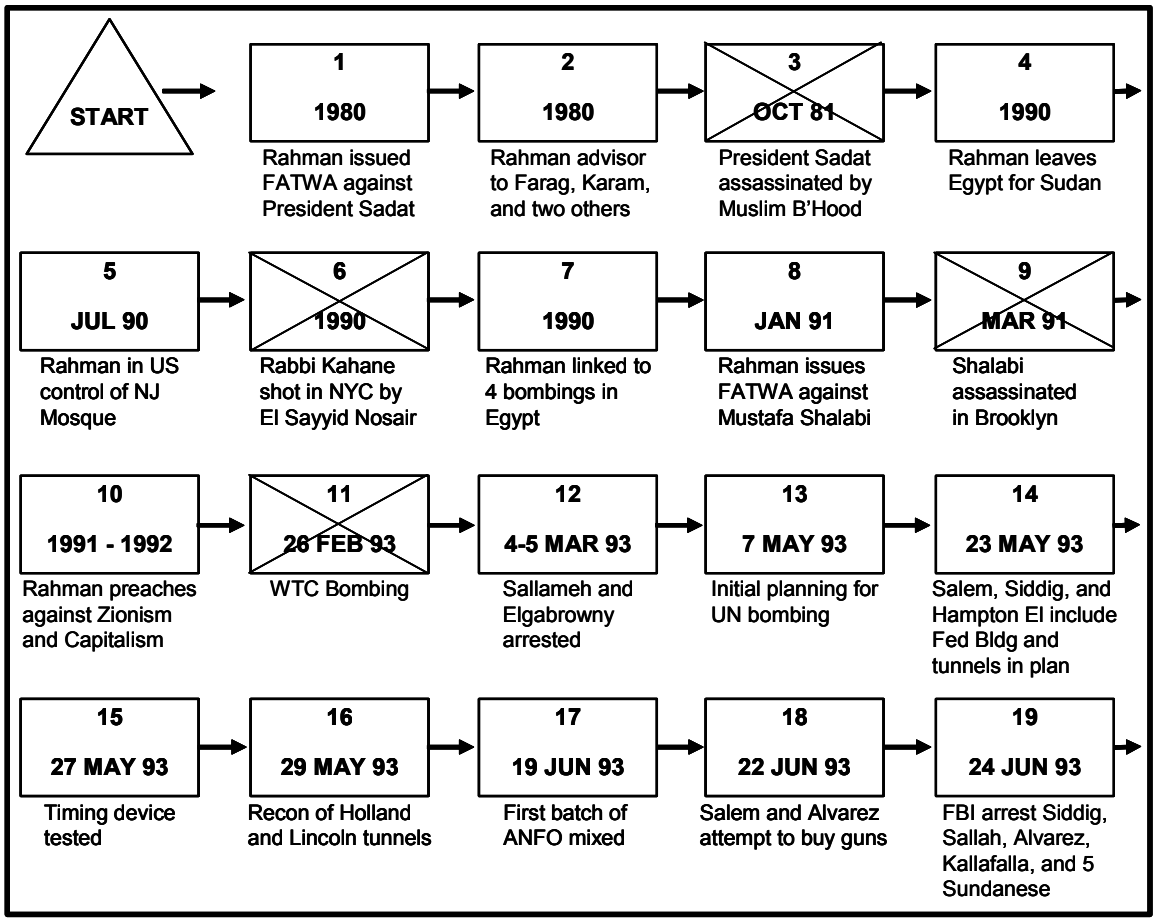

Figure 12-1. Example of a Time Event Chart.

12-21. Suspected or weak associations are those associations in which there are indicators that individuals may have had associations but there is no way to confirm that association; this is depicted with an open circle. Examples of *suspected associations* are—

- A known party calling a known telephone number (the analyst knows to whom the telephone number is listed) but it cannot be determined with certainty who answered the call.
- A face-to-face meeting where one party can be identified, but the other party can only be tentatively identified.

12-22. The rationale for depicting suspected associations is to get as close as possible to an objective analytic solution while staying as close as possible to known or confirmed facts. If a suspected association is later confirmed, the appropriate adjustment may be made on the association matrix. A secondary reason for depicting suspected associations is that it may give the analyst a focus for tasking limited intelligence collections assets in order to confirm the suspected association. An important point to remember about using the association matrix is that it will, without modification, show only the

existence of relationships; not the nature, degree, or duration of those relationships.

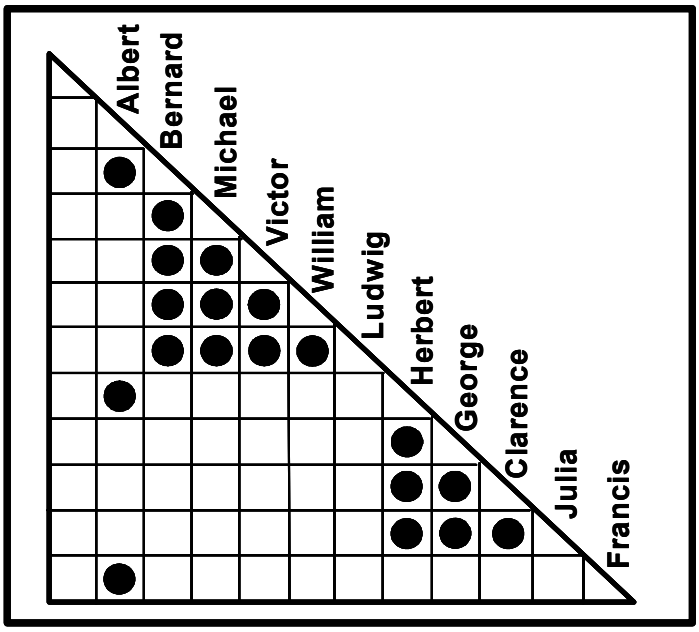

Figure 12-2. Example of an Association Matrix.

12-23. The activities matrix (Figure 12-3) is a rectangular array of personalities compared against activities, locations, events, or other appropriate information. The kind and quality of data that is available to the collector determines the number of rows and columns and their content. The analyst may tailor the matrix to fit the needs of the problem at hand or he may add to it as the problem expands in scope. This matrix normally is constructed with personalities arranged in a vertical listing on the left side of the matrix, and events, activities, organizations, addresses, or any other common denominator arranged along the bottom of the matrix. This matrix is critical for the study of a group's internal and external activities, external ties and linkages, and even modus operandi. As with the association matrix, confirmed or "strong" associations between individuals and non-personal entities are shown with a solid circle or dot, while suspected or "weak" associations are illustrated by an open circle.

12-24. Using matrices, the analyst can pinpoint the optimal targets for further intelligence collection, identify key personalities within an organization, and considerably increase the analyst's understanding of an organization and its structure. Matrices can be used to present briefings or to store information in a concise and understandable manner within a database. Matrices augment but cannot replace SOPs or standard database files. It is possible, and sometimes productive, to use one matrix for all associations. This is done routinely using the automated systems mentioned in paragraph 13-6.

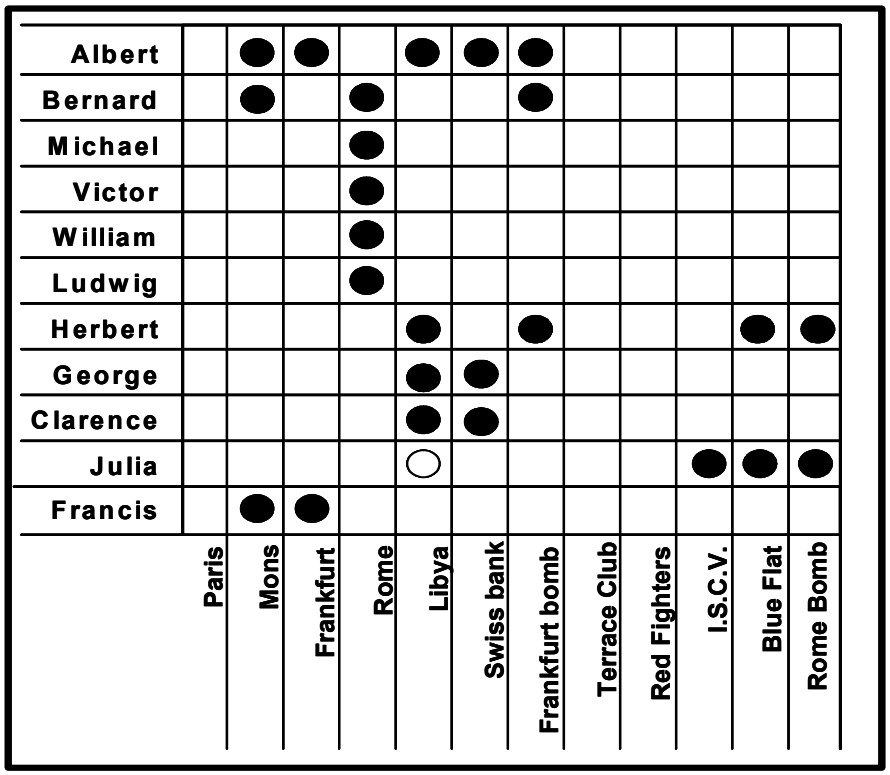

Figure 12-3. Example of an Activities Matrix.

12-25. The link analysis diagram (Figure 12-4) shows the connections between people, groups, or activities. The difference between matrices and link analysis is roughly the same as the difference between a mileage chart and a road map. The mileage chart (matrix) shows the connections between cities using numbers to represent travel distances. The map (link analysis diagram) uses symbols that represent cities, locations, and roads to show how two or more locations are linked to each other.

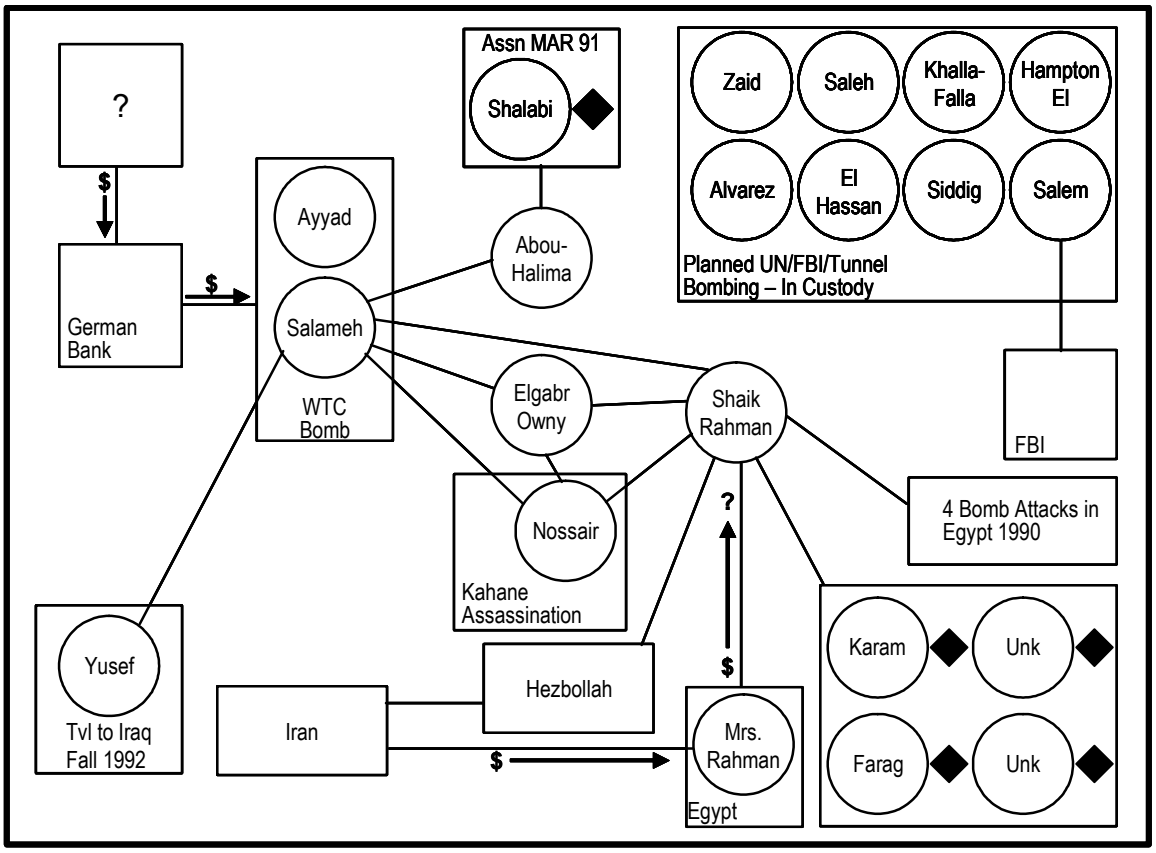

Figure 12-4. Example of a Link Analysis Diagram.

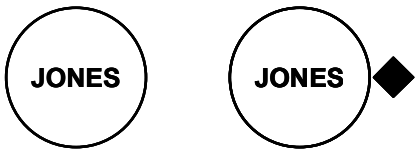
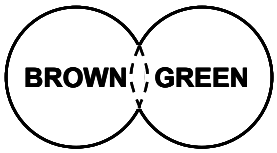
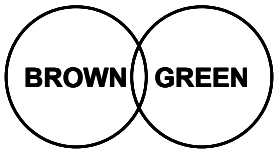
12-26. As with construction of association matrices, there are certain rules of graphics, symbology, and construction that must be followed. Standardization is critical to ensuring that everyone constructing, using, or reading a link analysis diagram understands exactly what the diagram depicts. Circles and lines are arranged so that no lines cross whenever possible. Often, especially when dealing with large groups, it is very difficult to construct a line diagram in which no lines cross. In these cases, every effort should be made to keep the number of crossings at an absolute minimum. The standard rules are as follows:

- Persons are shown as open circles with the name written inside the circle. Deceased persons are depicted in either open circles, with a diamond next to the circle representing that person (as in Figure 12-4) or as open diamonds with the name written inside the diamond.



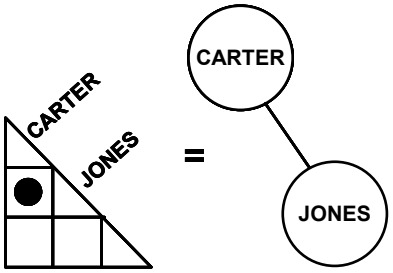
- Persons known by more than one name (alias or AKA) are shown as overlapping circles with names in each circle (as shown below) or both names are simply listed in the same circle. If the alias is suspected, a dotted line is used to depict the intersection. If the alias is confirmed, the intersection is shown with a solid line.

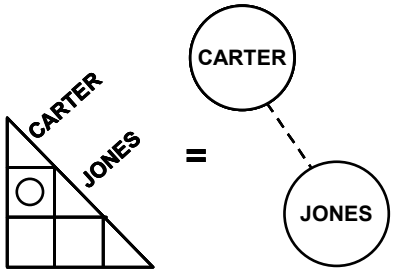




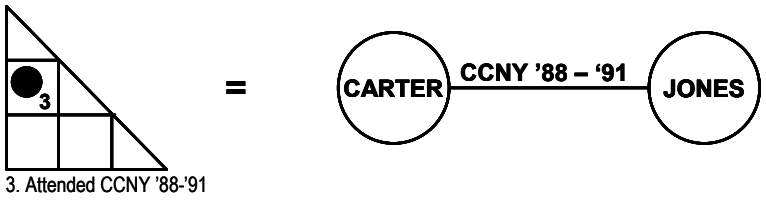
- Non-personal entities (organizations, governments, events, locations) are shown as appropriately labeled rectangles.

- Solid lines denote confirmed linkages or associations and dotted lines show suspected linkages and associations.



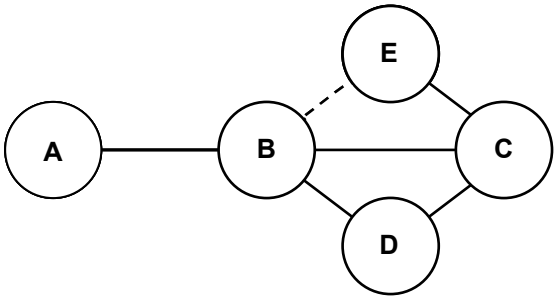


- Footnotes on the matrices can be shown as a brief legend on the connectivity line.



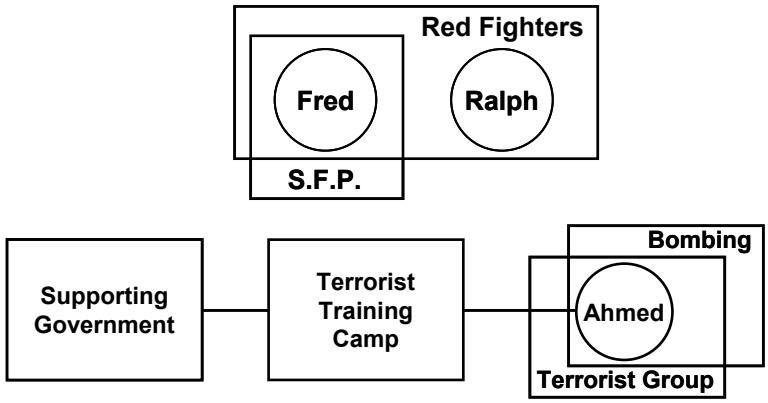
- Each person or non-personal entity is depicted only once in a link analysis diagram.

12-27. The following diagram shows only connectivity between persons:



12-28. The analyst can easily determine from the diagram that Alpha knows Bravo, Bravo knows Charlie and Delta. Bravo is suspected of knowing Echo and Charlie knows Delta, Bravo, and Echo. Although the same information could be shown on a matrix, it is easier to understand when depicted on a link analysis diagram. As situations or investigations become more complex, the ease in understanding a link analysis diagram becomes more apparent. In almost all cases, the available information is first depicted and analyzed on both types of matrices, which are then used to construct a link analysis diagram for further analysis.

12-29. Link analysis diagrams can show organizations, membership within the organization, action teams or cells, or participants in an event. Since each individual depicted on a link analysis diagram can be shown only once, and some individuals may belong to more than one organization or take part in more than one event, squares or rectangles representing non-personal entities may have to overlap. The following illustration demonstrates that Ralph and Fred are both members of the "Red Fighters," and that Fred also is a member of the "Students for Peace." Further, since Ralph and Fred are shown in the same “box,” it is a given that they are mutually associated.



12-30. There is more to overlapping organizations than is immediately obvious. At first glance, the overlap indicates only that an individual may belong to more than one organization or has taken part in multiple activities. Further study and analysis would reveal connections between organizations, connections between events, or connections between organizations and events, either directly or through persons. The above diagram reveals a more

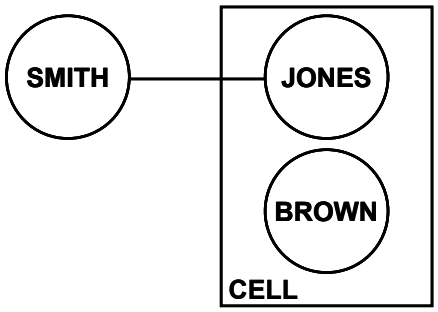
complex connection between organizations, personal connections, and linkages.

12-31. The analysis diagram in paragraph 12-29 shows a connection between organizations and events to which an individual belongs or is associated. In this case, a national government runs a training camp for terrorists. Ahmed, a member of the terrorist group, is associated with the training camp, and participated in the bombing attack. From this diagram, one can link the supporting government to the bombing through the camp and the participant.

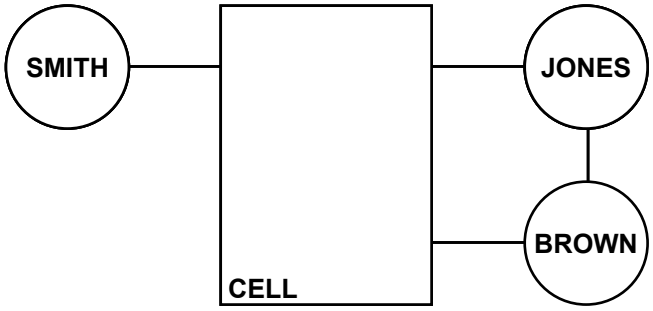
12-32. When, as is often the case, an organization or incident depicted in a link analysis diagram contains the names of more than one individual, it is not necessary to draw a solid line between those individuals to indicate connectivity. It is assumed that individual members of the same cell or participants in the same activity know each other, and the connection between them is therefore implied. If the persons are **not** mutually associated, they cannot be placed in the same "box." Another solution must be found to depict the situation; that is, show the persons as associated with a subordinate or different organization or activity.

12-33. A final set of rules for link analysis diagrams concerns connectivity between individuals who are not members of an organization or participants in an activity, but who are somehow connected to that entity. Two possibilities exist: First, the individual knows a member or members of the organization but is not associated with the organization itself; or second, the person is somehow connected with the organization or activity but cannot be directly linked with any particular member of that entity.

12-34. In the first case, the connectivity line is drawn only between the persons concerned as depicted here:



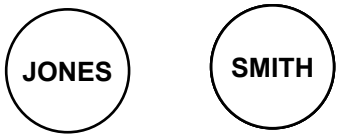
12-35. In the second case, where Smith is associated with the entity, but not the persons who are members of entity, the situation is shown as depicted here:



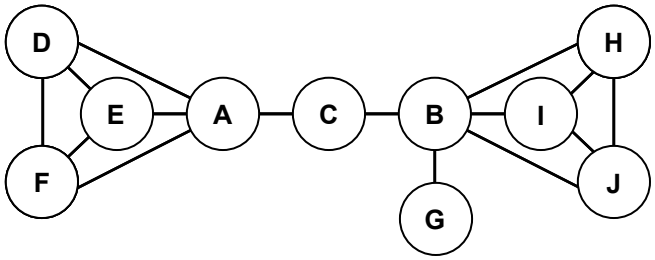
12-36. The steps in constructing a link analysis diagram are as follows:

- **Step 1**. Raw data or fragments of information are organized into logical order. Names of individuals, organizations, events, and locations are compiled on appropriate lists. At this point, a time event chart may be completed to assist in understanding the information and to arrange events into chronological order.
- **Step 2**. Information is entered onto the appropriate matrices, graphically displaying "who is associated with whom" and "who is associated with what."
- **Step 3.** Drawing information from the database and intelligence reports, and relationships from the matrices, the link analysis diagram can be constructed. The best method to start the link analysis diagram is to—
  - Start with the association matrix and determine which person has the greatest number of personal associations. Depict that person in the center of the page.

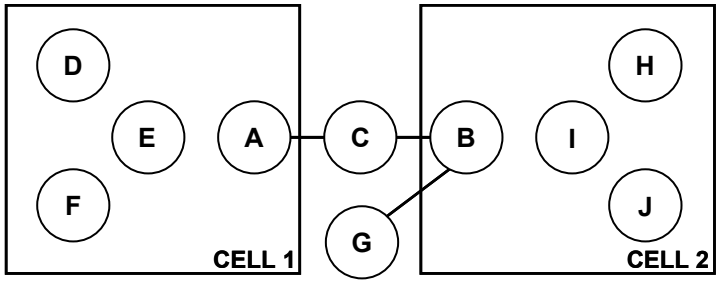
  - Determine which person has the next highest number of personal associations. Depict that person near the first person.



12-37. Use the association matrix and show all confirmed and suspected personal associations.



- After all personal associations have been shown on the link analysis diagram, the analyst uses the activities matrix to determine which activities, organizations, or other non-personal entities need to be depicted by appropriate rectangles. Having done so, the lines of connectivity between persons within the rectangles may be removed to prevent clutter. (It is assumed that participants in the same activity or members of the same cell are acquainted.)



12-38. As shown in Figure 12-4, the link analysis diagram depicts the membership, organization, activities, and connections of the group that, under the leadership of Sheik Omar Abdul Rahman, carried out the bombing of the World Trade Center in New York City and planned other bombing attacks. Together with the time event chart (Figure 12-1), one can gain a basic understanding of the group and its activities, and develop working hypotheses for additional collection and analysis efforts.

12-39. After completion of the matrices and the link analysis diagram, the analyst makes recommendations about the group's structure, and areas can be identified for further collection. Collection assets are employed to verify suspected connections, ID key personalities, and substantiate or refute the conclusions and assessments drawn from the link analysis that has been done. The link analysis diagram and thorough analysis of the information it contains can reveal a great deal about an organization. It can identify the group's leadership, its strong and weak points, and operational patterns. The analyst can use these to predict future activities.

OTHER ANALYSIS TOOLS

12-40. Pattern analysis is the process of deducing the doctrine and TTP that threat forces prefer to employ by careful observation and evaluation of patterns in its activities. This technique is based on the premise that threat COAs reflect certain characteristic patterns that can be identified and interpreted. Pattern analysis can be critically important when facing a threat whose doctrine is unknown and it is necessary to create new threat model and doctrinal templates. Three additional tools that can help the analyst to determine operational patterns and create and update their threat model are the coordinates register, pattern analysis plot sheet, and OB factors.

Coordinates Register

12-41. The coordinates register, or incident map, is one type of pattern analysis tool (Figure 12-5). It illustrates cumulative events that have occurred within the AO and focuses on the "where" of an event. The analyst may use multiple coordinates registers that focus on a different subject or blend subjects. Normally, the coordinates register includes additional information such as notes or graphics. The analyst should use the coordinates register in conjunction with the pattern analysis plot sheet.

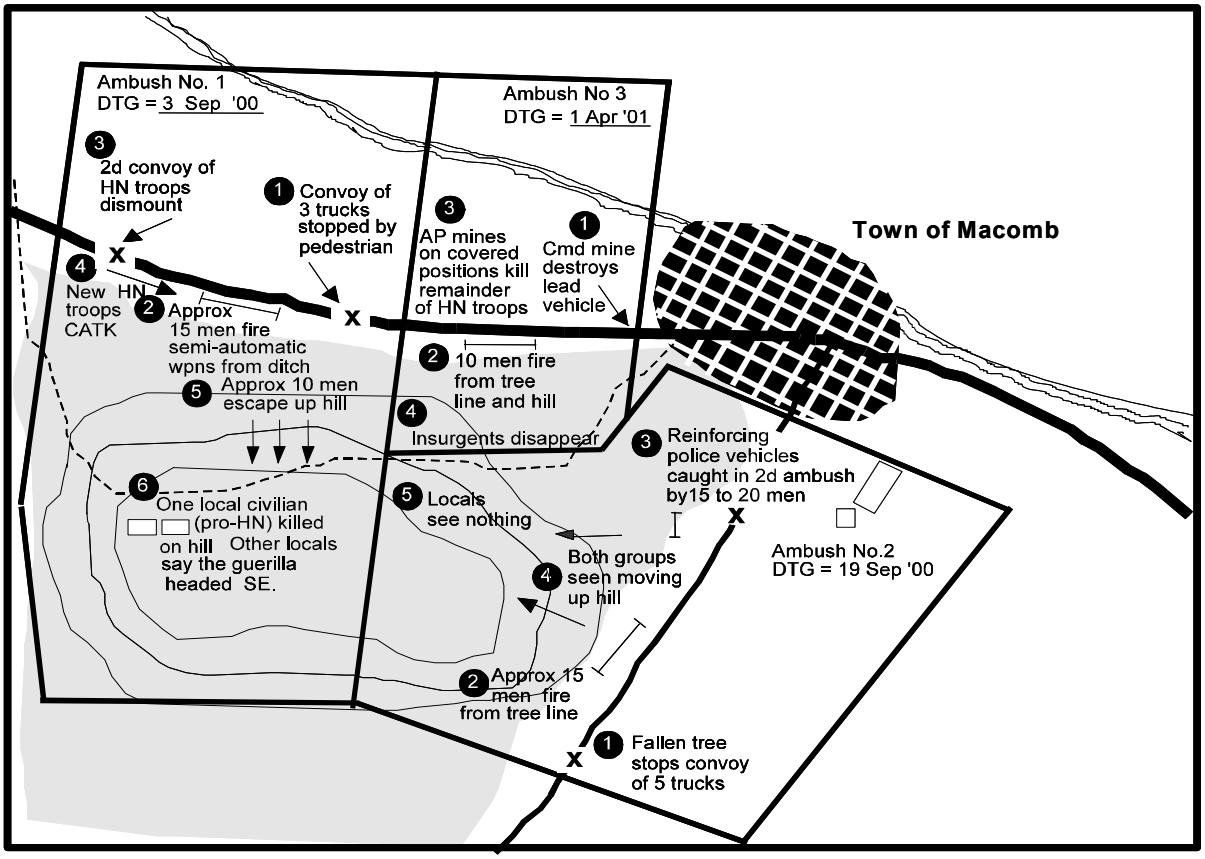


Figure 12-5. Coordinates Register.

Pattern Analysis Plot Sheet

12-42. The analyst uses a pattern analysis plot sheet to focus on the time and date of each serious incident that takes place within the AO (Figure 12-6) The rings depict days of the month; the segments depict the hours of the day As shown in the sheet's legend, the event itself is identified by using an alphanumeric designation and directly corresponds to the legend used on the coordinates register. Another type of the pattern analysis plot sheet helps distinguish patterns in activities that are tied to particular days, dates, or times. When used in conjunction with the coordinates register and any doctrinal templates, a pattern analysis plot sheet supplies the bulk of the data needed to complete an event template.

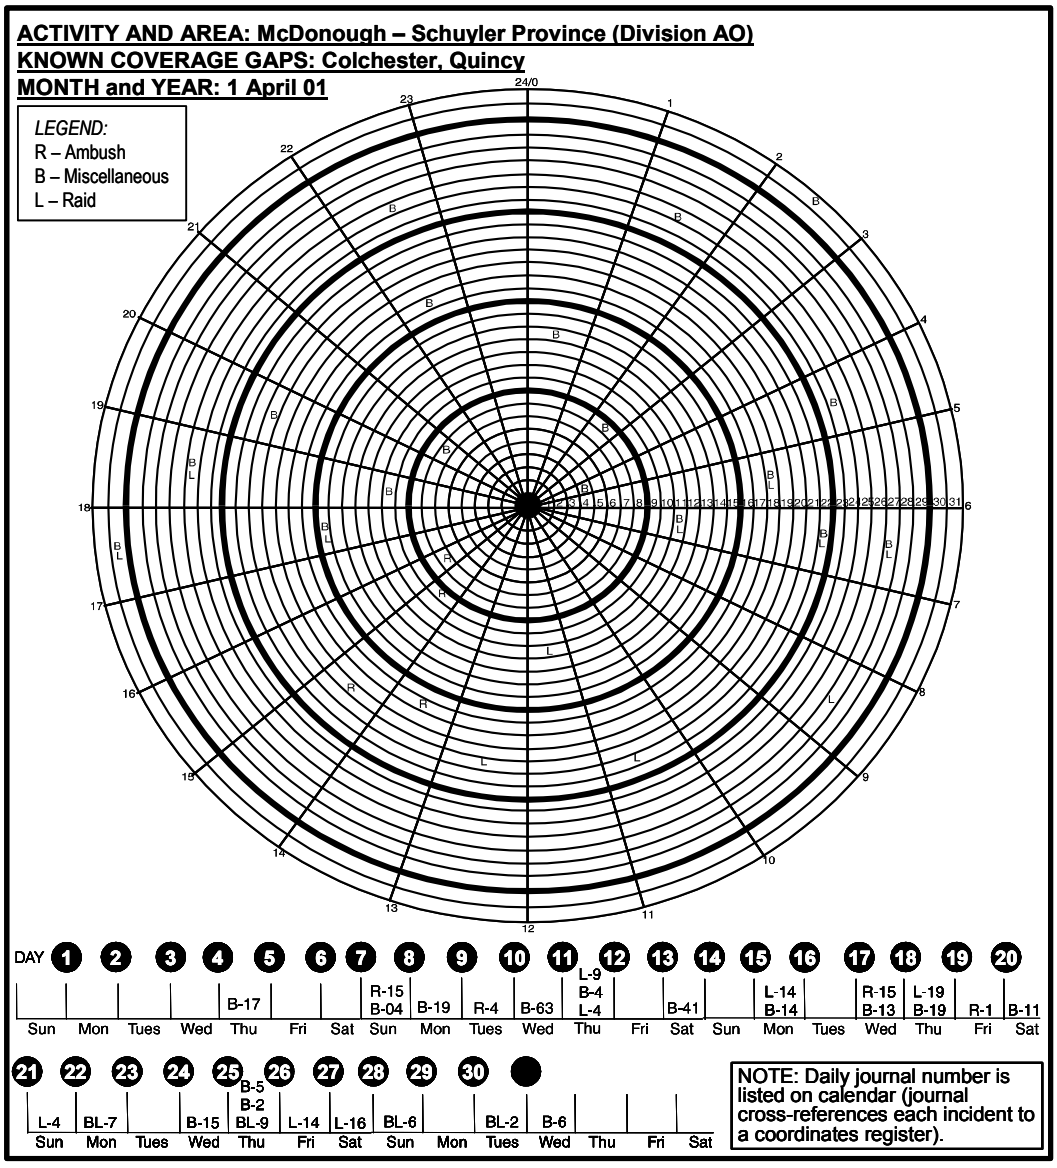

Figure 12-6. Pattern Analysis Plot Sheet.

OB Factors

12-43. A final analytical tool is OB. The OB does not predict enemy intentions or probable COAs but is a means of cataloging intelligence data that qualifies and quantifies certain aspects of threat units. The analyst uses nine factors shown in Table 12-1 to focus the analysis. These help the analyst determine threat capabilities, vulnerabilities, and COAs. Although the situation may dictate that one or more of the factors are given a higher priority, generally speaking, they are all of equal importance. The OB framework, while initially developed to support force-on-force offensive and defensive operations, is easily adapted to support stability and reconstruction operations and to depict "unconventional" forces or even civilian organizations.

Table 12-1. Order of Battle Factors.

Factor	Component
Composition	• Unit identification • Organization
Disposition	• Geographical Location • Tactical Deployment • Movements
Strength	• Personnel • Weapons and Equipment • Types of Units
Tactics	• Tactical Doctrine • Special Operations
Training	• Individual • Unit • Specialized
Logistics	• Systems • Status • Funding
Combat Effectiveness	• Combat Experience • Morale • Tactics • Logistics
Electronic Technical Data/Emitter Nomenclature	• Emitter Type • Mode of Emission • Frequency Range • Location Accuracy for Direction Finding • Associated Use (Units or Weapons)
Miscellaneous	• Personalities/Leadership • Unit History • Uniforms and Insignia • Code Names and Numbers

12-44. The OB is based on the premise that there are certain constants to any group activity. All groups whether they are conventional military forces, insurgent groups, or civilian organizations must have an organizational structure (composition). This structure may not be easily discernable but it will exist. Likewise, any organization has a location or locations in which it operates, personnel and equipment numbers, a system for training, getting supplies, judging efficiency and effectiveness of its operations, communi-

cating, and taking care of other intangibles such as morale. The OB gives the analyst a framework to organize information. The analyst adapts the topic headings to match the particular environment.

HUMINT SOURCE SELECTION

12-45. HUMINT source selection involves identifying, researching, and actively locating a specific group, organization, or individual for the purpose of collecting information in response to intelligence requirements. The HUMINT source selection process includes the C/J/G/S2X, the HOC, the HAT, the OMT, and the HCT. The source selection process allows the HUMINT team leader to identify the most likely source of information, eliminating the uncertainty of the access and placement of sources. Source selection also helps optimize the HUMINT collection effort. Any individual, group, organization, or agency that can be approached for information regarding intelligence requirements is a potential source. Sources are chosen according to their reliability, level of cooperation, and placement and access. Selection is particularly important in stability and reconstruction operations where the HUMINT collectors have access to a large potential source pool. Source selection establishes which current sources can best answer requirements and establishes source profiles to support the screening and selection of new sources.

ESTABLISH DATABASES AND TARGET FOLDERS

12-46. The establishment of local databases, target folders, and personality files is normally the responsibility of the OMT. This is done in coordination with the supporting ACE or analysis control team (ACT). Databases are required to manage the information. By using databases one can identify gaps in the information. The HCT and OMT access higher databases through intelligence reach to share and deconflict locally maintained data with higher level databases. Local databases can be created and used to help track source production, knowledge, reliability, and accuracy, and they simplify cross-reference data that is of primarily local interest. It is ideal to review and update databases at least weekly.

12-47. A target folder provides the collector with up-to-date intelligence information about details of the target. It includes anything of HUMINT value including biographies, descriptions, photographs, and previous information reports. The information can be gained from the ACE or ACT, past reports, INTSUMs, and databases; it can then be organized into easily accessible automated folders. Information on people is categorized and recorded in a personality file. The file serves as reference material for collectors. Information on key military and civilian figures can be of significant value when establishing unit or group identification, tactics, and combat effectiveness. The file should not only provide information on cultural, religious, tribal, political, military, criminal, and governmental background but also contain specific personalities for collectors to focus their collection effort on. This allows the collectors to concentrate on mission planning and to conduct their mission rather than to research information.

COMPARE SOURCE LIST WITH REQUIREMENTS

12-48. As target folders are compiled, a list of high-value sources will emerge. It is a simple matter to compare the source list with the PIRs and/or SIRs. This will lead to efficient and time-saving missions for the collectors. Rather than spend time meeting with sources who may have information concerning certain subjects, the HCT is able to tackle the collection process with foresight. Upon receipt of the mission, the OMT conducts mission analysis to determine the optimal way to meet mission requirements. Proper mission analysis enables the collector to properly focus his assets (sources) to gain the maximum amount of intelligence from those sources most likely to possess the highest quality information.

12-49. The following products, which will focus the HCT's collection efforts, can be prepared in conjunction with the ACE and joint intelligence centers:

- Time event charts.
- Source coverage overlays or matrices (see Figure 12-7).
- Link analysis diagrams.
- HUMINT portions of OPORDs and situation reports.

12-50. The source coverage overlay or matrix helps tie in the source coverage to the requirements. It also helps identify gaps in collection. A collection matrix serves the same purpose. It supplies a quick reference when answering intelligence requirements. The matrices must cover both the geographical area and the placement and access of the source. A demographic overlay helps to identify ethnic groups in an area and to track events and patterns based on religious or ethnic differences. The overlay and matrix are examples of how source coverage can be tied to intelligence requirements.

12-51. Source profiles are vital to screening sources for HUMINT collection operations and to identifying personnel that might be of interest to other agencies such as CI and TECHINT. As the situation changes, the HCT might be tasked with new collection requirements that cannot be answered by the current sources. The HCT is constantly looking for new and better sources. When presented with new requirements, the OMT develops a source profile of the type of individual that would most likely be able to provide the information required. This profiling can include placement, access, age, ethnic type, gender, location, occupation, and military specialty. The OMT first searches through existing local databases to try to get a source match. If not, it passes the profile to the HCTs along with the requirements to facilitate their screening of potential sources.

		L AREA	PIR 1	PIR 2	PIR 3	PIR 4	PIR 5	PIR 6
0001	Police	Village 1	X					
0002	Municipal Government	Village 1 and National		X	X			
0003	Political Party 1	City 1 and 2			X		X	
0004	Political Party 2	City 3 and 4		X		X		X

Chapter 13

Automation and Communication

13-1. Modern automation and communications systems are vital to HUMINT collection. Real-time collaboration, detailed operational planning and ISR integration, as well as enhanced collection and source exploitation tools, must support team efforts. Emerging technology continues to allow the entire HUMINT collection system to operate more effectively. Commanders must be prepared to supply their HUMINT collection assets with the best possible technology not only to enhance collection but also to optimize the survivability of the collectors. (See Appendix L.) Commanders may not be able to rely solely on standard military equipment but must be prepared to bridge the inevitable technological development gap through the identification and adaptation of commercially available products and technologies. For specific system components and capabilities, see ST 2-50.

AUTOMATION

13-2. HUMINT automation uses common hardware and software solutions with a flexible interactive user interface to provide standardization of equipment and processes across all operational environments and conditions. HUMINT automation must be deployable and scalable to fit the mission or force package. System components must be capable of intelligence reach to support forward-deployed elements. HUMINT automation allows integration and interaction with existing intelligence operations, HUMINT operational systems, and databases. This integration allows operations personnel and analysts to develop plans and levy collection and operational requirements, as well as to manage, control, analyze, and report the information collected. HUMINT automation—

- Provides connectivity and reach capability between all echelons of HUMINT activity.
- Receives higher echelon requirements and transmits requests for information.
- Converts HUMINT reporting into formats for JTF or coalition task force (CTF), theater, or national consumption.
- Pushes requirements, requests, and plans for HUMINT operations in theater as required.
- Maintains the central HUMINT database for the theater or AO.
- Leverages JTF or CTF, theater, and national level requirements and products for strategic, operational, and tactical HUMINT assets in theater.

- Enables HUMINT to provide accurate and timely correlated information to supported commanders through established reporting channels.
- Provides automated analysis tools.

13-3. Systems such as Trusted Workstation (TWS) can convert HUMINT reporting into formats for JTF or CTF, theater, or national consumption. TWS can also connect between the SIPRNET and any lower level networks, such as coalition, multinational, or NATO, or unclassified networks such as NIPRNET or the Internet.

COLLECTION SUPPORT AUTOMATION REQUIREMENTS

BIOMETRICS

13-4. Biometrics is the study of measurable biological characteristics. In HUMINT collection, biometric devices, usually computer based, enable the HUMINT collector to use biological data to support the collection and analysis effort. Biometrics can also be used in non-HUMINT efforts to collect and maintain evidence for criminal prosecution. The two major types of biometric data that are useful to the HUMINT collector are identification data and data that indicate source truthfulness. Identification devices use biological information such as fingerprints, voiceprints, facial scans, and retinal scans to match an individual to a source database. They can verify the identity of a specific individual from the target population during screening.

13-5. HCTs may be equipped with portable equipment for collecting, storing, analyzing, forwarding, and retrieving biometric information. The BAT is able to identify personnel by using identifying characteristics of their irises, fingerprints, or facial photograph. The structured query language (SQL) server-based database links identifying characteristics with all previous reports related to the person. Once a person's identifying characteristics are entered into the database, if that person is again detained and scanned, the system has a probability of identifying them that approaches 100 percent. This ability is especially useful for determining if a source is providing the same information to multiple collectors; thereby avoiding false confirmation of information. HUMINT collectors primarily use BAT during screening operations at all echelons; from checkpoint screening, to screening at a DCP, to screening at a JIDC. MPs use the Detainee Reporting System (DRS) during in-processing at internment facilities. The DRS records data for detainee processing and tracking and is intended to interact with the BAT system to avoid duplication of effort.

13-6. The hardware that makes up the system, which is given to MI teams, consists of a commercial off-the-shelf (COTS) semi-hardened laptop computer running an operating system with a graphical user interface. It has a camera and an iris scanner, each of which is portable and can be used independent of the computer to collect and temporarily store information. The system also includes a fingerprint scanner that conforms to FBI requirements for admissible evidence. The fingerprint scanner must be attached to the computer during use.

13-7. Biometric devices such as voice stress analyzer and polygraph support the determination of the truthfulness of a source. The polygraph is of limited usefulness in general HUMINT collection due to the level of expertise needed to operate it and the lack of general availability of the device to the field. As devices are developed that can remotely collect and report information to the HUMINT collector on subtle changes in the source's respiration, heartbeat, perspiration, and eye movement that can be indicators of deceit, they can be used to support HUMINT collection.

MACHINE TRANSLATION AND INTERPRETATION

13-8. Understanding oral and written communication in a foreign language is often the center of effective HUMINT collection operations. The optimal solution is to have an individual who is a trained collector of native proficiency, totally versed in the local situation and US requirements, with the requisite security clearance, who is capable of reporting accurately in English. Commanders' access to such individuals is usually problematic. This requirement is met through a combination of MI linguists, contractors, native speakers within the DOD system, and locally hired civilian translators. Difficulties arise if the proficiency levels of MI linguists are not up to mission requirements, or if the linguists do not possess the proper language for the theater of operation. Using locally hired translators raises security problems. In light of these conditions, an increasingly viable solution for the commander is the use of machine translation devices to meet some of these requirements.

13-9. Voice and text translation machines or software are critical in augmenting available linguists. This includes natural language processing, artificial intelligence, and optical character recognition (OCR) capabilities. The basic application of machine translation, such as speech recognition and OCRs, dramatically increases the speed of processing information. Software programs are becoming widely available that allow a non-linguist to determine the intelligence significance of a foreign document, aid linguists with laborious tasks, and add consistency to human translation.

13-10. Machine interpretation is the use of a machine to interpret the spoken word between the HUMINT collectors and another individual speaking a foreign language. Linguists are in high demand during operations and usually limited in number. As machine interpretation devices that address this problem become available to the field, they will improve the communication ability of non-linguists.

ANALYTICAL AUTOMATION REQUIREMENTS

13-11. The requirement for a robust HUMINT single-discipline analytical capability extends through all echelons from national level to the OMTs. Communication between HUMINT analysts at the operational level and analysts at the staff level may best be accomplished through a web-based communication capability. Web-based visual analytical tools allow maximum analyst participation in the development of products geared to mission planning, targeting, and information analysis at all echelons.

Analytical products must be responsive to the special needs of a specific collection operation, project, or element.

13-12. HUMINT collectors run operations in terrain made up of persons, organizations, and installations of interest. Intelligence analysis support determines the specific terrain in each team area and how it differs from one team's named area of interest (NAI) to another. Specific products include studies on nominated targets (persons, organizations, and installations) and trends based on HUMINT reporting, as appropriate, and visual analysis products (time event charts, matrices, link analysis diagrams, and organizational diagrams).

AUTOMATED ANALYSIS TOOLS

13-13. Automation of HUMINT analytical tools such as time event charts, association matrices, activity matrices, and link analysis diagrams dramatically increase predictive analysis capability. Automation saves time and permits access to more complete information thus producing a more accurate, timely product. Automated analysis techniques, aided by computerized virtual-viewing programs, allow the analyst better battlefield visualization. Automated analysis, linked to data and databases, includes artificial intelligence programs. These programs assist the analyst in developing predictions and identifying information gaps to support targeting and collection. Automation and web-based tools allow the analyst to—

- Track and cross-cue HUMINT reports.
- Incorporate data extraction technology, retrieval, automated data organization, content analysis, and visualization.
- Share analytical conclusions with HUMINT teams and other analysts in real time.
- Apply multidimensional technologies, content analysis techniques, and web-based collaborations.
- Display analytical results and view HUMINT operations in real time.
- Share resources such as models, queries, visualizations, map overlays, geospatial images, and tool outputs through a common interface.
- Apply clustering (a nonlinear search that compiles the results based on search parameters) and rapid spatial graphical and geographic visualization tools to determine the meaning of large informational streams.
- Rapidly discover links, patterns, relationships, and trends in text to use in predictive analysis.
- Capture analytical conclusions and automatically transfer to intelligence databases and systems.

SEARCH ENGINES

13-14. Search engines provide access to previously collected or known information facilitating the development of comprehensive analytical and intelligence products and avoiding unnecessary collection tasking redundancy. A tool set for data visualization, search, and discovery is required, which is embedded with several software programs for manipulating data from multiple databases. The types of modules in visualization packages should include search engines and knowledge discovery (semantic clustering) for unformatted data, applications for extracting and organizing formatted data, and data labeling. The package should also include a model building tool to enable users to make their archives more efficient with respect to search, retrieval, and compatibility to other applications as well as archiving and maintenance tools to support what will eventually become a large data warehouse. Search engines should be—

- Multilingual and able to query multiple classified and unclassified databases.
- Capable of developing, querying, and manipulating stored information.

WEB-BASED REPORTING AND PORTALS

13-15. Web-based reporting employs current Internet portal technology. The web-based portal is an efficient and effective means of developing a repository of HUMINT information. It employs an interactive graphic interface using client browser technology, search engines, hyperlinks, and intelligent software agents for searching, finding, viewing, and maintaining databases and supporting HUMINT work, data, and information flows. It supports collaborative analysis at multiple echelons through connectivity on the SIPRNET. The following pertains to web-based reporting:

- Web-based databases work with any computer hardware, operating system, or software and can be made accessible through web portals.
- Firewalls and information access are controlled at each level with an approving systems administrator at each level conducting quality control through release authority procedures.
- Graphic user interface uses standard Army and DOD report formats.
- Graphic user interface walks the user through a critical task and is able to identify Army and DOD reports as required. Reports must be Army and DOD platform compatible and transferable through and to their respective systems.
- Multimedia supports applications for attaching, associating, and hyperlinking video, still photographs, voice, scanned objects, graphics, and maps to records and files.

13-16. Web-based reporting and web pages developed for specific products allow the user to—

- Leverage their effort and expertise against all requirements, not just the ones that must be met immediately.

- Identify timely intelligence gaps and the leads to fill those gaps.
- Ensure immediate analytical feedback on collector reports to—
  - Post questions directly to a web page to enable all HCTs to answer or be cued to the specific request.
  - Identify or request clarification on questionable data for quality control.
- Fuse HUMINT information and all-source information as required.
- Focus collection teams supporting maneuver commanders' requirements more effectively.
- Immediately extract information for crisis reaction.

13-17. If HCTs use web portals to submit reports directly to theater level, they must also send the reports through their OMT for submission to the 2X. Failure to do so may deny the 2X the ability to deconflict and cross-reference reports. HUMINT collectors must ensure that they follow the theater-specific methodology for access to the theater web portal.

DATABASES

13-18. Without databases, information is difficult or impossible to retrieve quickly, especially under adverse conditions. Databases allow access to data in a distributed environment and support many complex HUMINT functions and requirements, including—

- Mission deconfliction.
- RM.
- RFIs.
- HUMINT analysis.
- Summary, report, and assessment preparation.
- Threat and friendly situation tracking.
- Targeting.

13-19. Databases interact with other tools to support predictive analysis, prepare graphic analytical products, and provide situational understanding down to the HCT. These databases—

- Support time event charts, association matrices, link analysis, and other analysis tools.
- Require a designated systems administrator at each. To ensure a high degree of integrity, discrepancies must be verified for accuracy.
- Allow operators, managers, and analysts to—
  - Compartment (protect) source-sensitive operational database segments, files, records, and fields.
  - Create, update, and maintain databases from locally generated information.
  - Import complete or partial databases from larger or peer databases.
  - Export complete or partial databases to peer or larger databases.

  - Share data and databases between peers, subordinates, or higher with appropriate access authorization.
- Provide systematic processing and automated parsing using standardized forms in intelligence operations, which are automatically parsed into appropriate databases for information storing, sharing, retrieval, and analysis.
- Allow query functions for decisionmaking as well as operational and analytical support.
- Provide analytical programs able to correlate data that facilitate information retrieval from any data repository.
- Incorporate information retrieval functions such as browsing (that is, point and click), key word searching, concepts, and similar functions.
- Support a suite of specialized decision support software (DSS)—a set of tools which supports HUMINT source administration, analysis, and risk management decisions. DSS tools should produce a set of HUMINT reports specifically tailored to the HUMINT decisionmaking, analysis, and assessment process.

13-20. HARMONY is the national intelligence database for foreign DOCEX and translations management. HARMONY is the single, comprehensive bibliographic reference for all available primary source foreign technical and military documents and their translations. This single database concept eliminates duplicate collection, translation, and reporting of primary source foreign technical and military documents and greatly streamlines the process of providing exploited documents to consumers. The HARMONY database application uses the DOD Information Infrastructure (DII) Common Operating Environment (COE) guidance. The HARMONY database is web-enabled and can be readily accessed, easily used, and responsive to the needs of analysts and other consumers within the US Government community.

AUTOMATION SYSTEMS

13-21. The HUMINT collection automation systems are normally shared systems used by both the HUMINT and CI communities. They must have connectivity with lateral units as well as higher and subordinate elements.

C/J/G/S2X, HOC, AND HAT AUTOMATION REQUIREMENTS

13-22. The HUMINT staff elements need to receive input from the OMTs and HCTs as well as input from higher and lateral echelons. They must be able to conduct HUMINT planning, RM, and report dissemination. They must transmit technical support information, interface with ACE and automated analysis systems, manipulate HUMINT databases, conduct reach, and have access to HUMINT analytical tools.

OMT AND COLLECTION TEAM LEADER REQUIREMENTS

13-23. The OMT must be able to track teams and team members; receive and transmit data including graphic data to and from higher, lateral, and lower HUMINT elements; create, receive, edit, and transmit reports; conduct single-discipline HUMINT analysis; receive and transmit technical support information and tasking information; conduct reach; and conduct mission planning.

INDIVIDUAL COLLECTOR AUTOMATION REQUIREMENTS

13-24. The key to effective HUMINT collection is unimpeded communication between the collector and the source of information. Any technological support to HUMINT collection must be as unobtrusive as possible to minimize the intimidation factor when dealing with human sources. The individual collector must be able to—

- Record (both video and voice) conversations with sources.
- Scan, translate, and transmit documents and photographs.
- Instantaneously locate themselves in both rural and urban environments.
- Immediately access local, theater, and even national level databases.
- Communicate instantaneously with other team elements.

HUMINT AND CI WORKSTATION REQUIREMENTS

13-25. The CI and HUMINT teams have organic computer and data processing equipment. These workstations provide HUMINT and CI teams with both productivity and management and analysis tools. They also provide SIPRNET connectivity and processing capability to identify requirements and facilitate reporting into other DOD systems as required. The HUMINT and CI workstation is able to use standard Army, DOD, and HUMINT and CI reporting programs, standard symbols, programs to produce map overlays, and map plotting software; all of which are included.

13-26. Teams use workstations to—

- Provide quality control and dissemination of reports from the subordinate HCTs.
- Direct activities of subordinate HCTs and provide management to them.
- Perform single-discipline HUMINT analysis for the supported commander.
- Transmit intelligence and administrative reports in NRT to higher headquarters.
- Receive tasking and administrative reports from higher headquarters and distribute to HCTs as required.
- Consolidate local databases and provide database input to higher headquarters.
- Receive database and digital information from higher headquarters and pass to lower and vice versa.

COMMUNICATIONS

13-27. Successful HUMINT operations must be supported by multi-echelon technical control and a communications system that provides internal team communications, links HCTs to OMTs, and links OMTs to higher headquarters, analytical elements, and theater and national agencies.

COMMUNICATION ARCHITECTURE

13-28. The HUMINT collection architecture requires operation on several communications and processing nets. These nets provide the framework needed to coordinate the tasking, reporting, C2, and service support of HUMINT collection units spread across the width and depth of the battlefield. Under most operational scenarios, HCTs are not stationary. They are constantly moving throughout their supported command's AO and are able to communicate on the move. They cannot rely on fixed communications nodes for support. Communications redundancy ensures the loss of any one system does not severely disrupt HUMINT operations. HCTs and OMTs normally operate at the collateral security level to ensure the timely dissemination of combat information and targeting data to organizations operating outside MI channels. The C/J/G/S2X normally requires access to Top Secret (SCI) communications capabilities to maintain coordination with national level agencies.

13-29. The HUMINT collection assets use three basic communications nets: the operations and intelligence (O/I) net, a command net, and a HUMINT-specific technical net. Dependent on their mission and battlefield location, the HCTs may also need to monitor the fire support element (FSE), aviation, or air defense artillery (ADA) communications nets.

- The O/I net links the collectors and producers of intelligence to the consumers of the intelligence information. It is used to pass information of immediate value to the affected unit and to analytical elements at the supported unit.
- The command nets exist at every echelon of command. They link the superior headquarters with its subordinate elements. Normally a unit will operate on two command nets; the one that links that unit to its higher headquarters and the one that links that unit to its subordinate elements. HUMINT elements will also use their unit's command net to coordinate logistic and administrative support.
- The technical nets link the control team to all of their subordinate collection teams and to the centers or organizations that provide the databases and technical guidance necessary for single-discipline collection and analysis. For example, the technical net would connect HCTs through their control teams to the S2X and higher echelon HUMINT analysis organizations.

MOBILE COMMUNICATIONS REQUIREMENTS

13-30. HUMINT mobile communications requirements augment the network connectivity that elements should have when at a base camp or facility; they vary with each element's mission and location as follows:

- Individual HUMINT collectors must maintain communications capability with the other team members and the team leader while dismounted. HUMINT collectors, especially when supporting offensive and defensive operations, may be deployed as individuals. They need to maintain contact with their team leader for technical and operational support.
- The HCT may operate anywhere within the supported unit's AO. They may operate mounted or dismounted. If supporting airmobile, airborne, amphibious, or other mobile operations, they may not have access to their vehicle-mounted communications systems for the critical early stages of these operations. They receive and report operational and technical information, as well as report intelligence information to the OMT using their unit's command net. They monitor their superior unit's O/I net. If in DS to a maneuver element, they also monitor the command net of the unit they are supporting.
- OMTs normally operate on the superior unit O/I net, their unit C2 net, and the HUMINT technical net. If the OMT is in DS, it must also operate on the C2 net of the supported unit.
- The C/J/G/S2X operates on the C2 net, monitors the O/I net, and controls its echelon HUMINT technical net. The 2X needs secure (SCI) communications capability to coordinate operations and pass data between themselves and higher HUMINT organizations.

Appendix A

Geneva Conventions

SECTION I. GENEVA CONVENTIONS RELATIVE TO THE TREATMENT OF PRISONERS OF WAR (THIRD GENEVA CONVENTION)

The articles in this section are extracted from the Geneva Convention Relative to the Treatment of Prisoners of War, 12 August 1949.

PART I GENERAL PROVISIONS

ARTICLE 1

The High Contracting Parties undertake to respect and to ensure respect for the present Convention in all circumstances.

ARTICLE 2

In addition to the provisions which shall be implemented in peace time, the present Convention shall apply to all cases of declared war or of any other armed conflict which may arise between two or more of the High Contracting Parties, even if the state of war is not recognized by one of them.

The Convention shall also apply to all cases of partial or total occupation of the territory of a High Contracting Party, even if the said occupation meets with no armed resistance.

Although one of the Powers in conflict may not be a party to the present Convention, the Powers who are parties thereto shall remain bound by it in their mutual relations. They shall furthermore be bound by the Convention in relation to the said Power, if the latter accepts and applies the provisions thereof.

ARTICLE 3

In the case of armed conflict not of an international character occurring in the territory of one of the High Contracting Parties, each party to the conflict shall be bound to apply, as a minimum, the following provisions:

1. Persons taking no active part in the hostilities, including members of armed forces who have laid down their arms and those placed hors de combat by sickness, wounds, detention, or any other cause, shall in all circumstances be treated humanely, without any adverse distinction founded on race, color, religion or faith, sex, birth or wealth, or any other similar criteria. To this end the following acts are and shall remain prohibited at any time and in any place whatsoever with respect to the above-mentioned persons:

(a) Violence to life and person, in particular murder of all kinds, mutilation, cruel treatment and torture;

(b) Taking of hostages;

(c) Outrages upon personal dignity, in particular, humiliating and degrading treatment;

(d) The passing of sentences and the carrying out of executions without previous judgment pronounced by a regularly constituted court affording all the judicial guarantees which are recognized as indispensable by civilized peoples.

2. The wounded and sick shall be collected and cared for.

An impartial humanitarian body, such as the International Committee of the Red Cross, may offer its services to the Parties to the conflict.

The Parties to the conflict should further endeavor to bring into force, by means of special agreements, all or part of the other provisions of the present Convention.

The application of the preceding provisions shall not affect the legal status of the Parties to the conflict.

ARTICLE 4

A. Prisoners of war, in the sense of the present Convention, are persons belonging to one of the following categories, who have fallen into the power of the enemy:

1. Members of the armed forces of a Party to the conflict as well as members of militias or volunteer corps forming part of such armed forces.

2. Members of other militias and members of other volunteer corps, including those of organized resistance movements, belonging to a Party to the conflict and operating in or outside their own territory, even if this territory is occupied, provided that such militias or volunteer corps, including such organized resistance movements, fulfill the following conditions:

(a) That of being commanded by a person responsible for his subordinates;

(b) That of having a fixed distinctive sign recognizable at a distance;

(c) That of carrying arms openly;

(d) That of conducting their operations in accordance with the laws and customs of war.

3. Members of regular armed forces who profess allegiance to a government or an authority not recognized by the Detaining Power.

4. Persons who accompany the armed forces without actually being members thereof, such as civilian members of military aircraft crews, war correspondents, supply contractors, members of labor units or of services responsible for the welfare of the armed forces, provided that they have received authorization from the armed forces which they accompany, who shall provide them for that purpose with an identity card similar to the annexed model.

5. Members of crews, including masters, pilots and apprentices, of the merchant marine and the crews of civil aircraft of the Parties to the conflict, who do not benefit by more favorable treatment under any other provisions of international law.

6. Inhabitants of a non-occupied territory, who on the approach of the enemy spontaneously take up arms to resist the invading forces, without having had time to form themselves into regular armed units, provided they carry arms openly and respect the laws and customs of war.

B. The following shall likewise be treated as prisoners of war under the present Convention:

1. Persons belonging, or having belonged, to the armed forces of the occupied country, if the occupying Power considers it necessary by reason of such allegiance to intern them, even though it has originally liberated them while hostilities were going on outside the territory it occupies, in particular where such persons have made an unsuccessful attempt to rejoin the armed forces to which they belong and which are engaged in combat, or where they fail to comply with a summons made to them with a view to internment.

2. The persons belonging to one of the categories enumerated in the present Article, who have been received by neutral or non-belligerent Powers on their territory and whom these Powers are required to intern under international law, without prejudice to any more favorable treatment which these Powers may choose to give and with the exception of Articles 8, 10, 15, 30, fifth paragraph, 58-67, 92, 126 and, where diplomatic relations exist between the Parties to the conflict and the neutral or non-belligerent Power concerned, those Articles concerning the Protecting Power. Where such diplomatic relations exist, the Parties to a conflict on whom these persons depend shall be allowed to perform towards them the functions of a Protecting Power as provided in the present Convention, without prejudice to the functions which these Parties normally exercise in conformity with diplomatic and consular usage and treaties.

C. This Article shall in no way affect the status of medical personnel and chaplains as provided for in Article 33 of the present Convention.

ARTICLE 5

The present Convention shall apply to the persons referred to in Article 4 from the time they fall into the power of the enemy and until their final release and repatriation.

Should any doubt arise as to whether persons, having committed a belligerent act and having fallen into the hands of the enemy, belong to any of the categories enumerated in Article 4, such persons shall enjoy the protection of the present Convention until such time as their status has been determined by a competent tribunal.

ARTICLE 6

In addition to the agreements expressly provided for in Articles 10, 23, 28, 33, 60, 65, 66, 67, 72, 73, 75, 109, 110, 118, 119, 122 and 132, the High Contracting Parties may conclude other special agreements for all matters concerning which they may deem it suitable to make separate provision. No special agreement shall adversely affect the situation of prisoners of war, as defined by the present Convention, nor restrict the rights which it confers upon them.

Prisoners of war shall continue to have the benefit of such agreements as long as the Convention is applicable to them, except where express provisions to the contrary are contained in the aforesaid or in subsequent agreements, or where more favorable measures have been taken with regard to them by one or other of the Parties to the conflict.

ARTICLE 7

Prisoners of war may in no circumstances renounce in part or in entirety the rights secured to them by the present Convention, and by the special agreements referred to in the foregoing Article, if such there be.

ARTICLE 8

The present Convention shall be applied with the cooperation and under the scrutiny of the Protecting Powers whose duty it is to safeguard the interests of the Parties to the conflict. For this purpose, the Protecting Powers may appoint, apart from their diplomatic or consular staff, delegates from amongst their own nationals or the nationals of other neutral Powers. The said delegates shall be subject to the approval of the Power with which they are to carry out their duties.

The Parties to the conflict shall facilitate to the greatest extent possible the task of the representatives or delegates of the Protecting Powers.

The representatives or delegates of the Protecting Powers shall not in any case exceed their mission under the present Convention. They shall, in particular, take account of the imperative necessities of security of the State wherein they carry out their duties.

ARTICLE 9

The provisions of the present Convention constitute no obstacle to the humanitarian activities which the International Committee of the Red Cross or any other impartial humanitarian organization may, subject to the consent of the Parties to the conflict concerned, undertake for the protection of prisoners of war and for their relief.

ARTICLE 10

The High Contracting Parties may at any time agree to entrust to an organization which offers all guarantees of impartiality and efficacy the duties incumbent on the Protecting Powers by virtue of the present Convention.

When prisoners of war do not benefit or cease to benefit, no matter for what reason, by the activities of a Protecting Power or of an organization provided for in the first paragraph above, the Detaining Power shall request a neutral State, or such an organization, to undertake the functions performed under the present Convention by a Protecting Power designated by the Parties to a conflict.

If protection cannot be arranged accordingly, the Detaining Power shall request or shall accept, subject to the provisions of this Article, the offer of the services of a humanitarian organization, such as the International Committee of the Red Cross, to assume the humanitarian functions performed by Protecting Powers under the present Convention.

Any neutral Power or any organization invited by the Power concerned or offering itself for these purposes, shall be required to act with a sense of responsibility towards the Party to the conflict on which persons protected by the present Convention depend, and shall be required to furnish sufficient assurances that it is in a position to undertake the appropriate functions and to discharge them impartially.

No derogation from the preceding provisions shall be made by special agreements between Powers one of which is restricted, even temporarily, in its freedom to negotiate with the other Power or its allies by reason of military events, more particularly where the whole, or a substantial part, of the territory of the said Power is occupied.

Whenever in the present Convention mention is made of a Protecting Power, such mention applies to substitute organizations in the sense of the present Article.

ARTICLE 11

In cases where they deem it advisable in the interest of protected persons, particularly in cases of disagreement between the Parties to the conflict as to the application or interpretation of the provisions of the present Convention, the Protecting Powers shall lend their good offices with a view to settling the disagreement.

For this purpose, each propose to the Parties of the Protecting Powers may, either at the invitation of one Party or on its own initiative, to the conflict a meeting of their representatives, and in particular of the authorities responsible for prisoners of war, possibly on neutral territory suitably chosen. The Parties to the conflict shall be bound to give effect to the proposals made to them for this purpose. The Protecting Powers may, if necessary, propose for approval by the Parties to the conflict a person belonging to a neutral Power, or delegated by the International Committee of the Red Cross, who shall be invited to take part in such a meeting.

PART II GENERAL PROTECTION OF PRISONERS OF WAR

ARTICLE 12

Prisoners of war are in the hands of the enemy Power, but not of the individuals or military units who have captured them. Irrespective of the individual responsibilities that may exist, the Detaining Power is responsible for the treatment given them.

Prisoners of war may only be transferred by the Detaining Power to a Power which is a party to the Convention and after the Detaining Power has satisfied itself of the willingness and ability of such transferee Power to apply the Convention. When prisoners of war are transferred under such circumstances, responsibility for the application of the Convention rests on the Power accepting them while they are in its custody.

Nevertheless if that Power fails to carry out the provisions of the Convention in any important respect, the Power by whom the prisoners of war were transferred shall, upon being notified by the PROTECTING Power, take effective measures to correct the situation or shall request the return of the prisoners of war. Such requests must be complied with.

ARTICLE 13

Prisoners of war must at all times be humanely treated. Any unlawful act or omission by the Detaining Power causing death or seriously endangering the health of a prisoner of war in its custody is prohibited, and will be regarded as a serious breach of the present Convention. In particular, no prisoner of war may be subjected to physical mutilation or to medical or scientific experiments of any kind which are not justified by the medical, dental or hospital treatment of the prisoner concerned and carried out in his interest.

Likewise, prisoners of war must at all times be protected, particularly against acts of violence or intimidation and against insults and public curiosity.

Measures of reprisal against prisoners of war are prohibited.

ARTICLE 14

Prisoners of war are entitled in all circumstances to respect for their persons and their honor. Women shall be treated with all the regard due to their sex and shall in all cases benefit by treatment as favorable as that granted to men. Prisoners of war shall retain the full civil capacity which they enjoyed at the time of their capture. The Detaining Power may not restrict the exercise, either within or without its own territory, of the rights such capacity confers except in so far as the captivity requires.

ARTICLE 15

The Power detaining prisoners of war shall be bound to provide free of charge for their maintenance and for the medical attention required by their state of health.

ARTICLE 16

Taking into consideration the provisions of the present Convention relating to rank and sex, and subject to any privileged treatment which may be accorded to them by reason of their state of health, age or professional qualifications, all prisoners of war shall be treated alike by the Detaining Power, without any adverse distinction based on race, nationality, religious belief or political opinions, or any other distinction founded on similar criteria.

PART III CAPTIVITY

SECTION I BEGINNING OF CAPTIVITY

ARTICLE 17

Every prisoner of war, when questioned on the subject, is bound to give only his surname, first names and rank, date of birth, and army, regimental, personal or serial number, or failing this, equivalent information. If he willfully infringes this rule, he may render himself liable to a restriction of the privileges accorded to his rank or status.

Each Party to a conflict is required to furnish the persons under its jurisdiction who are liable to become prisoners of war, with an identity card showing the owner's surname, first names, rank, army, regimental, personal or serial number or equivalent information, and date of birth. The

identity card may, furthermore, bear the signature or the fingerprints, or both, of the owner, and may bear, as well, any other information the Party to the conflict may wish to add concerning persons belonging to its armed forces. As far as possible the card shall measure 6.5 x 10 cm. and shall be issued in duplicate. The identity card shall be shown by the prisoner of war upon demand, but may in no case be taken away from him.

No physical or mental torture, nor any other form of coercion, may be inflicted on prisoners of war to secure from them information of any kind whatever. Prisoners of war who refuse to answer may not be threatened, insulted, or exposed to any unpleasant or disadvantageous treatment of any kind.

Prisoners of war who, owing to their physical or mental condition, are unable to state their identity, shall be handed over to the medical service. The identity of such prisoners shall be established by all possible means, subject to the provisions of the preceding paragraph.

The questioning of prisoners of war shall be carried out in a language which they understand.

ARTICLE 18

All effects and articles of personal use, except arms, horses, military equipment and military documents shall remain in the possession of prisoners of war, likewise their metal helmets and gas masks and like articles issued for personal protection. Effects and articles used for their clothing or feeding shall likewise remain in their possession, even if such effects and articles belong to their regulation military equipment.

At no time should prisoners of war be without identity documents. The Detaining Power shall supply such documents to prisoners of war who possess none.

Badges of rank and nationality, decorations and articles having above all a personal or sentimental value may not be taken from prisoners of war.

Sums of money carried by prisoners of war may not be taken away from them except by order of an officer, and after the amount and particulars of the owner have been recorded in a special register and an itemized receipt has been given, legibly inscribed with the name, rank and unit of the person issuing the said receipt. Sums in the currency of the Detaining Power, or which are changed into such currency at the prisoner's request, shall be placed to the credit of the prisoner's account as provided in Article 64.

The Detaining Power may withdraw articles of value from prisoners of war only for reasons of security; when such articles are withdrawn, the procedure laid down for sums of money impounded shall apply.

Such objects, likewise the sums taken away in any currency other than that of the Detaining Power and the conversion of which has not been asked for by the owners, shall be kept in the custody of the Detaining Power and shall be returned in their initial shape to prisoners of war at the end of their captivity.

ARTICLE 19

Prisoners of war shall be evacuated, as soon as possible after their capture, to camps situated in an area far enough from the combat zone for them to be out of danger.

Only those prisoners of war who, owing to wounds or sickness, would run greater risks by being evacuated than by remaining where they are, may be temporarily kept back in a danger zone.

Prisoners of war shall not be unnecessarily exposed to danger while awaiting evacuation from a fighting zone.

ARTICLE 20

The evacuation of prisoners of war shall always be effected humanely and in conditions similar to those for the forces of the Detaining Power in their changes of station.

The Detaining Power shall supply prisoners of war who are being evacuated with sufficient food and potable water, and with the necessary clothing and medical attention. The Detaining Power shall take all suitable precautions to ensure their safety during evacuation, and shall establish as soon as possible a list of the prisoners of war who are evacuated.

If prisoners of war must, during evacuation, pass through transit camps, their stay in such camps shall be as brief as possible.

SECTION II INTERNMENT OF PRISONERS OF WAR

CHAPTER I GENERAL OBSERVATIONS

ARTICLE 21

The Detaining Power may subject prisoners of war to internment. It may impose on them the obligation of not leaving, beyond certain limits, the camp where they are interned, or if the said camp is fenced in, of not going outside its perimeter. Subject to the provisions of the present Convention relative to penal and disciplinary sanctions, prisoners of war may not be held in close confinement except where necessary to safeguard their health and then only during the continuation of the circumstances which make such confinement necessary.

Prisoners of war may be partially or wholly released on parole or promise, in so far as is allowed by the laws of the Power on which they depend. Such measures shall be taken particularly in cases where this may contribute to the improvement of their state of health. No prisoner of war shall be compelled to accept liberty on parole or promise.

Upon the outbreak of hostilities, each Party to the conflict shall notify the adverse Party of the laws and regulations allowing or forbidding its own nationals to accept liberty on parole or promise. Prisoners of war who are paroled or who have given their promise in conformity with the laws and regulations so notified, are bound on their personal honor scrupulously to fulfil, both towards the Power on which they depend and towards the Power which has captured them, the engagements of their paroles or promises. In such cases, the Power on which they depend is bound neither to require nor to accept from them any service incompatible with the parole or promise given.

ARTICLE 22

Prisoners of war may be interned only in premises located on land and affording every guarantee of hygiene and healthfulness. Except in particular cases which are justified by the interest of the prisoners themselves, they shall not be interned in penitentiaries.

Prisoners of war interned in unhealthy areas, or where the climate is injurious for them, shall be removed as soon as possible to a more favorable climate.

The Detaining Power shall assemble prisoners of war in camps or camp compounds according to their nationality, language and customs, provided that such prisoners shall not be separated from prisoners of war belonging to the armed forces with which they were serving at the time of their capture, except with their consent.

ARTICLE 23

No prisoner of war may at any time be sent to or detained in areas where he may be exposed to the fire of the combat zone, nor may his presence be used to render certain points or areas immune from military operations.

Prisoners of war shall have shelters against air bombardment and other hazards of war, to the same extent as the local civilian population. With the exception of those engaged in the protection of their quarters against the aforesaid hazards, they may enter such shelters as soon as possible after the giving of the alarm. Any other protective measure taken in favor of the population shall also apply to them.

Detaining Powers shall give the Powers concerned, through the intermediary of the Protecting Powers, all useful information regarding the geographical location of prisoner of war camps.

Whenever military considerations permit, prisoner of war camps shall be indicated in the daytime by the letters PW or PG, placed so as to be clearly visible from the air. The Powers concerned may, however, agree upon any other system of marking. Only prisoner of war camps shall be marked as such.

ARTICLE 24

Transit or screening camps of a permanent kind shall be fitted out under conditions similar to those described in the present Section, and the prisoners therein shall have the same treatment as in other camps.

CHAPTER II QUARTERS, FOOD AND CLOTHING OF PRISONERS OF WAR

ARTICLE 25

Prisoners of war shall be quartered under conditions as favorable as those for the forces of the Detaining Power who are billeted in the same area. The said conditions shall make allowance for the habits and customs of the prisoners and shall in no case be prejudicial to their health.

The foregoing provisions shall apply in particular to the dormitories of prisoners of war as regards both total surface and minimum cubic space, and the general installations, bedding and blankets.

The premises provided for the use of prisoners of war individually or collectively, shall be entirely protected from dampness and adequately heated and lighted, in particular between dusk and lights out. All precautions must be taken against the danger of fire.

In any camps in which women prisoners of war, as well as men, are accommodated, separate dormitories shall be provided for them.

ARTICLE 26

The basic daily food rations shall be sufficient in quantity, quality and variety to keep prisoners of war in good health and to prevent loss of weight or the development of nutritional deficiencies. Account shall also be taken of the habitual diet of the prisoners.

The Detaining Power shall supply prisoners of war who work with such additional rations as are necessary for the labor on which they are employed.

Sufficient drinking water shall be supplied to prisoners of war. The use of tobacco shall be permitted.

Prisoners of war shall, as far as possible, be associated with the preparation of their meals; they may be employed for that purpose in the kitchens. Furthermore, they shall be given the means of preparing, themselves, the additional food in their possession.

Adequate premises shall be provided for messing.

Collective disciplinary measures affecting food are prohibited.

ARTICLE 27

Clothing, underwear and footwear shall be supplied to prisoners of war in sufficient quantities by the Detaining Power, which shall make allowance for the climate of the region where the prisoners are detained. Uniforms of enemy armed forces captured by the Detaining Power should, if suitable for the climate, be made available to clothe prisoners of war.

The regular replacement and repair of the above articles shall be assured by the Detaining Power. In addition, prisoners of war who work shall receive appropriate clothing, wherever the nature of the work demands.

ARTICLE 28

Canteens shall be installed in all camps, where prisoners of war may procure foodstuffs, soap and tobacco and ordinary articles in daily use. The tariff shall never be in excess of local market prices. The profits made by camp canteens shall be used for the benefit of the prisoners; a special fund shall be created for this purpose. The prisoners' representative shall have the right to collaborate in the management of the canteen and of this fund.

When a camp is closed down, the credit balance of the special fund shall be handed to an international welfare organization, to be employed for the benefit of prisoners of war of the same

nationality as those who have contributed to the fund. In case of a general repatriation, such profits shall be kept by the Detaining Power, subject to any agreement to the contrary between the Powers concerned

CHAPTER III HYGIENE AND MEDICAL ATTENTION

ARTICLE 29

The Detaining Power shall be bound to take all sanitary measures necessary to ensure the cleanliness and healthfulness of camps and to prevent epidemics.

Prisoners of war shall have for their use, day and night, conveniences which conform to the rules of hygiene and are maintained in a constant state of cleanliness. In any camps in which women prisoners of war are accommodated, separate conveniences shall be provided for them.

Also, apart from the baths and showers with which the camps shall be furnished, prisoners of war shall be provided with sufficient water and soap for their personal toilet and for washing their personal laundry; the necessary installations, facilities and time shall be granted them for that purpose.

ARTICLE 30

Every camp shall have an adequate infirmary where prisoners of war may have the attention they require, as well as appropriate diet. Isolation wards shall, if necessary, be set aside for cases of contagious or mental disease.

Prisoners of war suffering from serious disease, or whose condition necessitates special treatment, a surgical operation or hospital care, must be admitted to any military or civilian medical unit where such treatment can be given, even if their repatriation is contemplated in the near future. Special facilities shall be afforded for the care to be given to the disabled, in particular to the blind, and for their rehabilitation, pending repatriation.

Prisoners of war shall have the attention, preferably, of medical personnel of the Power on which they depend and, if possible, of their nationality.

Prisoners of war may not be prevented from presenting themselves to the medical authorities for examination. The detaining authorities shall, upon request, issue to every prisoner who has undergone treatment, an official certificate indicating the nature of his illness or injury, and the duration and kind of treatment received. A duplicate of this certificate shall be forwarded to the Central Prisoners of War Agency.

The costs of treatment, including those of any apparatus necessary for the maintenance of prisoners of war in good health, particularly dentures and other artificial appliances, and spectacles, shall be borne by the Detaining Power.

ARTICLE 31

Medical inspections of prisoners of war shall be held at least once a month. They shall include the checking and the recording of the weight of each prisoner of war. Their purpose shall be, in particular, to supervise the general state of health, nutrition and cleanliness of prisoners and to detect contagious diseases, especially tuberculosis, malaria and venereal disease. For this

purpose the most efficient methods available shall be employed, e.g. periodic mass miniature radiography for the early detection of tuberculosis.

ARTICLE 32

Prisoners of war who, though not attached to the medical service of their armed forces, are physicians, surgeons, dentists, nurses or medical orderlies, may be required by the Detaining Power to exercise their medical functions in the interests of prisoners of war dependent on the same Power. In that case they shall continue to be prisoners of war, but shall receive the same treatment as corresponding medical personnel retained by the Detaining Power. They shall be exempted from any other work under Article 49.

Chapter IV Medical Personnel and Chaplains Retained To Assist Prisoners Of War

ARTICLE 33

Members of the medical personnel and chaplains while retained by the Detaining Power with a view to assisting prisoners of war, shall not be considered as prisoners of war. They shall, however, receive as a minimum the benefits and protection of the present Convention, and shall also be granted all facilities necessary to provide for the medical care of, and religious ministration to, prisoners of war.

They shall continue to exercise their medical and spiritual functions for the benefit of prisoners of war, preferably those belonging to the armed forces upon which they depend, within the scope of the military laws and regulations of the Detaining Power and under the control of its competent services, in accordance with their professional etiquette. They shall also benefit by the following facilities in the exercise of their medical or spiritual functions:

(a) They shall be authorized to visit periodically prisoners of war situated in working detachments or in hospitals outside the camp. For this purpose, the Detaining Power shall place at their disposal the necessary means of transport.

(b) The senior medical officer in each camp shall be responsible to the camp military authorities for everything connected with the activities of retained medical personnel. For this purpose, Parties to the conflict shall agree at the outbreak of hostilities on the subject of the corresponding ranks of the medical personnel, including that of societies mentioned in Article 26 of the Geneva Convention for the Amelioration of the Condition of the Wounded and Sick in Armed Forces in the Field of August 12, 1949. This senior medical officer, as well as chaplains, shall have the right to deal with the competent authorities of the camp on all questions relating to their duties. Such authorities shall afford them all necessary facilities for correspondence relating to these questions.

(c) Although they shall be subject to the internal discipline of the camp in which they are retained, such personnel may not be compelled to carry out any work other than that concerned with their medical or religious duties.

During hostilities, the Parties to the conflict shall agree concerning the possible relief of retained personnel and shall settle the procedure to be followed.

None of the preceding provisions shall relieve the Detaining Power of its obligations with regard to prisoners of war from the medical or spiritual point of view.

CHAPTER V RELIGIOUS, INTELLECTUAL AND PHYSICAL ACTIVITIES

ARTICLE 34

Prisoners of war shall enjoy complete latitude in the exercise of their religious duties, including attendance at the service of their faith, on condition that they comply with the disciplinary routine prescribed by the military authorities.

Adequate premises shall be provided where religious services may be held.

ARTICLE 35

Chaplains who fall into the hands of the enemy Power and who remain or are retained with a view to assisting prisoners of war, shall be allowed to minister to them and to exercise freely their ministry amongst prisoners of war of the same religion, in accordance with their religious conscience. They shall be allocated among the various camps and labor detachments containing prisoners of war belonging to the same forces, speaking the same language or practicing the same religion. They shall enjoy the necessary facilities, including the means of transport provided for in Article 33, for visiting the prisoners of war outside their camp. They shall be free to correspond, subject to censorship, on matters concerning their religious duties with the ecclesiastical authorities in the country of detention and with international religious organizations. Letters and cards which they may send for this purpose shall be in addition to the quota provided for in Article 71.

ARTICLE 36

Prisoners of war who are ministers of religion, without having officiated as chaplains to their own forces, shall be at liberty, whatever their denomination, to minister freely to the members of their community. For this purpose, they shall receive the same treatment as the chaplains retained by the Detaining Power. They shall not be obliged to do any other work.

ARTICLE 37

When prisoners of war have not the assistance of a retained chaplain or of a prisoner of war minister of their faith, a minister belonging to the prisoners' or a similar denomination, or in his absence a qualified layman, if such a course is feasible from a confessional point of view, shall be appointed, at the request of the prisoners concerned, to fill this office. This appointment, subject to the approval of the Detaining Power, shall take place with the agreement of the community of prisoners concerned and, wherever necessary, with the approval of the local religious authorities of the same faith. The person thus appointed shall comply with all regulations established by the Detaining Power in the interests of discipline and military security.

ARTICLE 38

While respecting the individual preferences of every prisoner, the Detaining Power shall encourage the practice of intellectual, educational, and recreational pursuits, sports and games amongst prisoners, and shall take the measures necessary to ensure the exercise thereof by providing them with adequate premises and necessary equipment.

Prisoners shall have opportunities for taking physical exercise, including sports and games, and for being out of doors. Sufficient open spaces shall be provided for this purpose in all camps.

CHAPTER VI DISCIPLINE

ARTICLE 39

Every prisoner of war camp shall be put under the immediate authority of a responsible commissioned officer belonging to the regular armed forces of the Detaining Power. Such officer shall have in his possession a copy of the present Convention; he shall ensure that its provisions are known to the camp staff and the guard and shall be responsible, under the direction of his government, for its application.

Prisoners of war, with the exception of officers, must salute and show to all officers of the Detaining Power the external marks of respect provided for by the regulations applying in their own forces.

Officer prisoners of war are bound to salute only officers of a higher rank of the Detaining Power; they must, however, salute the camp commander regardless of his rank.

ARTICLE 40

The wearing of badges of rank and nationality, as well as of decorations, shall be permitted.

ARTICLE 41

In every camp the text of the present Convention and its Annexes and the contents of any special agreement provided for in Article 6, shall be posted, in the prisoners' own language, at places where all may read them. Copies shall be supplied, on request, to the prisoners who cannot have access to the copy which has been posted.

Regulations, orders, notices and publications of every kind relating to the conduct of prisoners of war shall be issued to them in a language which they understand. Such regulations, orders and publications shall be posted in the manner described above and copies shall be handed to the prisoners' representative. Every order and command addressed to prisoners of war individually must likewise be given in a language which they understand.

ARTICLE 42

The use of weapons against prisoners of war, especially against those who are escaping or attempting to escape, shall constitute an extreme measure, which shall always be preceded by warnings appropriate to the circumstances.

CHAPTER VII RANK OF PRISONERS OF WAR

ARTICLE 43

Upon the outbreak of hostilities, the Parties to the conflict shall communicate to one another the titles and ranks of all the persons mentioned in Article 4 of the present Convention, in order to ensure equality of treatment between prisoners of equivalent rank. Titles and ranks which are subsequently created shall form the subject of similar communications.

The Detaining Power shall recognize promotions in rank which have been accorded to prisoners of war and which have been duly notified by the Power on which these prisoners depend.

ARTICLE 44

Officers and prisoners of equivalent status shall be treated with the regard due to their rank and age.

In order to ensure service in officers' camps, other ranks of the same armed forces who, as far as possible, speak the same language, shall be assigned in sufficient numbers, account being taken of the rank of officers and prisoners of equivalent status. Such orderlies shall not be required to perform any other work.

Supervision of the mess by the officers themselves shall be facilitated in every way.

ARTICLE 45

Prisoners of war other than officers and prisoners of equivalent status shall be treated with the regard due to their rank and age.

Supervision of the mess by the prisoners themselves shall be facilitated in every way.

CHAPTER VIII TRANSFER OF PRISONERS OF WAR AFTER THEIR ARRIVAL IN CAMP

ARTICLE 46

The Detaining Power, when deciding upon the transfer of prisoners of war, shall take into account the interests of the prisoners themselves, more especially so as not to increase the difficulty of their repatriation.

The transfer of prisoners of war shall always be effected humanely and in conditions not less favorable than those under which the forces of the Detaining Power are transferred. Account shall always be taken of the climatic conditions to which the prisoners of war are accustomed and the conditions of transfer shall in no case be prejudicial to their health.

The Detaining Power shall supply prisoners of war during transfer with sufficient food and drinking water to keep them in good health, likewise with the necessary clothing, shelter and medical attention. The Detaining Power shall take adequate precautions especially in case of transport by sea or by air, to ensure their safety during transfer, and shall draw up a complete list of all transferred prisoners before their departure.

ARTICLE 47

Sick or wounded prisoners of war shall not be transferred as long as their recovery may be endangered by the journey, unless their safety imperatively demands it.

If the combat zone draws closer to a camp, the prisoners of war in the said camp shall not be transferred unless their transfer can be carried out in adequate conditions of safety, or if they are exposed to greater risks by remaining on the spot than by being transferred.

ARTICLE 48

In the event of transfer, prisoners of war shall be officially advised of their departure and of their new postal address. Such notifications shall be given in time for them to pack their luggage and inform their next of kin.

They shall be allowed to take with them their personal effects, and the correspondence and parcels which have arrived for them. The weight of such baggage may be limited, if the conditions of transfer so require, to what each prisoner can reasonably carry, which shall in no case be more than twenty-five kilograms per head.

Mail and parcels addressed to their former camp shall be forwarded to them without delay. The camp commander shall take, in agreement with the prisoners' representative, any measures needed to ensure the transport of the prisoners' community property and of the luggage they are unable to take with them in consequence of restrictions imposed by virtue of the second paragraph of this Article.

The costs of transfers shall be borne by the Detaining Power.

SECTION III LABOR OF PRISONERS OF WAR

ARTICLE 49

The Detaining Power may utilize the labor of prisoners of war who are physically fit, taking into account their age, sex, rank and physical aptitude, and with a view particularly to maintaining them in a good state of physical and mental health.

Non-commissioned officers who are prisoners of war shall only be required to do supervisory work. Those not so required may ask for other suitable work which shall, so far as possible, be found for them.

If officers or persons of equivalent status ask for suitable work, it shall be found for them, so far as possible, but they may in no circumstances be compelled to work.

ARTICLE 50

Besides work connected with camp administration, installation or maintenance, prisoners of war may be compelled to do only such work as is included in the following classes:

(a) Agriculture;

(b) Industries connected with the production or the extraction of raw materials, and manufacturing industries, with the exception of metallurgical, machinery and chemical industries; public works and building operations which have no military character or purpose;

(c) Transport and handling of stores which are not military in character or purpose;

(d) Commercial business, and arts and crafts;

(e) Domestic service;

(f) Public utility services having no military character or purpose.

Should the above provisions be infringed, prisoners of war shall be allowed to exercise their right of complaint, in conformity with Article 78.

ARTICLE 51

Prisoners of war must be granted suitable working conditions, especially as regards accommodation, food, clothing and equipment; such conditions shall not be inferior to those enjoyed by nationals of the Detaining Power employed in similar work; account shall also be taken of climatic conditions.

The Detaining Power, in utilizing the labor of prisoners of war, shall ensure that in areas in which prisoners are employed, the national legislation concerning the protection of labor, and, more particularly, the regulations for the safety of workers, are duly applied.

Prisoners of war shall receive training and be provided with the means of protection suitable to the work they will have to do and similar to those accorded to the nationals of the Detaining Power. Subject to the provisions of Article 52, prisoners may be submitted to the normal risks run by these civilian workers.

Conditions of labor shall in no case be rendered more arduous by disciplinary measures.

ARTICLE 52

Unless he be a volunteer, no prisoner of war may be employed on labor which is of an unhealthy or dangerous nature.

No prisoner of war shall be assigned to labor which would be looked upon as humiliating for a member of the Detaining Power's own forces.

The removal of mines or similar devices shall be considered as dangerous labor.

ARTICLE 53

The duration of the daily labor of prisoners of war, including the time of the journey to and fro, shall not be excessive, and must in no case exceed that permitted for civilian workers in the district, who are nationals of the Detaining Power and employed on the same work.

Prisoners of war must be allowed, in the middle of the day's work, a rest of not less than one hour. This rest will be the same as that to which workers of the Detaining Power are entitled, if the latter is of longer duration. They shall be allowed in addition a rest of twenty-four consecutive hours every week, preferably on Sunday or the day of rest in their country of origin. Furthermore, every prisoner who has worked for one year shall be granted a rest of eight consecutive days, during which his working pay shall be paid him.

If methods of labor such as piecework are employed, the length of the working period shall not be rendered excessive thereby.

ARTICLE 54

The working pay due to prisoners of war shall be fixed in accordance with the provisions of Article 62 of the present Convention.

Prisoners of war who sustain accidents in connection with work, or who contract a disease in the course, or in consequence of their work, shall receive all the care their condition may require. The Detaining Power shall furthermore deliver to such prisoners of war a medical certificate enabling them to submit their claims to the Power on which they depend, and shall send a duplicate to the Central Prisoners of War Agency provided for in Article 123.

ARTICLE 55

The fitness of prisoners of war for work shall be periodically verified by medical examinations at least once a month. The examinations shall have particular regard to the nature of the work which prisoners of war are required to do.

If any prisoner of war considers himself incapable of working, he shall be permitted to appear before the medical authorities of his camp. Physicians or surgeons may recommend that the prisoners who are, in their opinion, unfit for work, be exempted therefrom.

ARTICLE 56

The organization and administration of labor detachments shall be similar to those of prisoner of war camps.

Every labor detachment shall remain under the control of and administratively part of a prisoner of war camp. The military authorities and the commander of the said camp shall be responsible, under the direction of their government, for the observance of the provisions of the present Convention in labor detachments.

The camp commander shall keep an up-to-date record of the labor detachments dependent on his camp, and shall communicate it to the delegates of the Protecting Power, of the International Committee of the Red Cross, or of other agencies giving relief to prisoners of war, who may visit the camp.

ARTICLE 57

The treatment of prisoners of war who work for private persons, even if the latter are responsible for guarding and protecting them, shall not be inferior to that which is provided for by the present Convention. The Detaining Power, the military authorities and the commander of the camp to which such prisoners belong shall be entirely responsible for the maintenance, care, treatment, and payment of the working pay of such prisoners of war.

Such prisoners of war shall have the right to remain in communication with the prisoners' representatives in the camps on which they depend.

SECTION IV FINANCIAL RESOURCES OF PRISONERS OF WAR

ARTICLE 58

Upon the outbreak of hostilities, and pending an arrangement on this matter with the Protecting Power, the Detaining Power may determine the maximum amount of money in cash or in any similar form that prisoners may have in their possession. Any amount in excess, which was properly in their possession and which has been taken or withheld from them, shall be placed to their account, together with any monies deposited by them, and shall not be converted into any other currency without their consent.

If prisoners of war are permitted to purchase services or commodities outside the camp against payment in cash, such payments shall be made by the prisoner himself or by the camp administration who will charge them to the accounts of the prisoners concerned. The Detaining Power will establish the necessary rules in this respect.

ARTICLE 59

Cash which was taken from prisoners of war, in accordance with Article 18, at the time of their capture, and which is in the currency of the Detaining Power, shall be placed to their separate accounts, in accordance with the provisions of Article 64 of the present Section.

The amounts, in the currency of the Detaining Power, due to the conversion of sums in other currencies that are taken from the prisoners of war at the same time, shall also be credited to their separate accounts.

ARTICLE 60

The Detaining Power shall grant all prisoners of war a monthly advance of pay, the amount of which shall be fixed by conversion, into the currency of the said Power, of the following amounts:

Category I: Prisoners ranking below sergeant: eight Swiss francs.

Category II: Sergeants and other non-commissioned officers, or prisoners of equivalent rank: twelve Swiss francs.

Category III: Warrant officers and commissioned officers below the rank of major or prisoners of equivalent rank: fifty Swiss francs.

Category IV: Majors, lieutenant colonels, colonels or prisoners of equivalent rank: sixty Swiss francs.

Category V: General officers or prisoners of equivalent rank: seventy-five Swiss francs.

However, the Parties to the conflict concerned may by special agreement modify the amount of advances of pay due to prisoners of the preceding categories.

Furthermore, if the amounts indicated in the first paragraph above would be unduly high compared with the pay of the Detaining Power's armed forces or would, for any reason, seriously embarrass the Detaining Power, then, pending the conclusion of a special agreement with the Power on which the prisoners depend to vary the amounts indicated above, the Detaining Power:

(a) Shall continue to credit the accounts of the prisoners with the amounts indicated in the first paragraph above;

(b) May temporarily limit the amount made available from these advances of pay to prisoners of war for their own use, to sums which are reasonable, but which, for Category I, shall never be inferior to the amount that the Detaining Power gives to the members of its own armed forces.

The reasons for any limitations will be given without delay to the Protecting Power.

ARTICLE 61

The Detaining Power shall accept for distribution as supplementary pay to prisoners of war sums which the Power on which the prisoners depend may forward to them, on condition that the sums to be paid shall be the same for each prisoner of the same category, shall be payable to all prisoners of that category depending on that Power, and shall be placed in their separate accounts, at the earliest opportunity, in accordance with the provisions of Article 64. Such supplementary pay shall not relieve the Detaining Power of any obligation under this Convention.

ARTICLE 62

Prisoners of war shall be paid a fair working rate of pay by the detaining authorities direct. The rate shall be fixed by the said authorities, but shall at no time be less than one-fourth of one Swiss franc for a full working day. The Detaining Power shall inform prisoners of war, as well as the Power on which they depend, through the intermediary of the Protecting Power, of the rate of daily working pay that it has fixed.

Working pay shall likewise be paid by the detaining authorities to prisoners of war permanently detailed to duties or to a skilled or semi-skilled occupation in connection with the administration, installation or maintenance of camps, and to the prisoners who are required to carry out spiritual or medical duties on behalf of their comrades.

The working pay of the prisoners' representative, of his advisers, if any, and of his assistants, shall be paid out of the fund maintained by canteen profits. The scale of this working pay shall be fixed by the prisoners' representative and approved by the camp commander. If there is no such fund, the detaining authorities shall pay these prisoners a fair working rate of pay.

ARTICLE 63

Prisoners of war shall be permitted to receive remittances of money addressed to them individually or collectively.

Every prisoner of war shall have at his disposal the credit balance of his account as provided for in the following Article, within the limits fixed by the Detaining Power, which shall make such payments as are requested. Subject to financial or monetary restrictions which the Detaining Power regards as essential, prisoners of war may also have payments made abroad. In this case payments addressed by prisoners of war to dependants shall be given priority.

In any event, and subject to the consent of the Power on which they depend, prisoners may have payments made in their own country, as follows: the Detaining Power shall send to the aforesaid

Power through the Protecting Power a notification giving all the necessary particulars concerning the prisoners of war, the beneficiaries of the payments, and the amount of the sums to be paid, expressed in the Detaining Power's currency. The said notification shall be signed by the prisoners and countersigned by the camp commander. The Detaining Power shall debit the prisoners' account by a corresponding amount; the sums thus debited shall be placed by it to the credit of the Power on which the prisoners depend.

To apply the foregoing provisions, the Detaining Power may usefully consult the Model Regulations in Annex V of the present Convention.

ARTICLE 64

The Detaining Power shall hold an account for each prisoner of war, showing at least the following:

1. The amounts due to the prisoner or received by him as advances of pay, as working pay or derived from any other source; the sums in the currency of the Detaining Power which were taken from him; the sums taken from him and converted at his request into the currency of the said Power.

2. The payments made to the prisoner in cash, or in any other similar form; the payments made on his behalf and at his request; the sums transferred under Article 63, third paragraph.

ARTICLE 65

Every item entered in the account of a prisoner of war shall be countersigned or initialed by him, or by the prisoners' representative acting on his behalf.

Prisoners of war shall at all times be afforded reasonable facilities for consulting and obtaining copies of their accounts, which may likewise be inspected by the representatives of the Protecting Powers at the time of visits to the camp.

When prisoners of war are transferred from one camp to another, their personal accounts will follow them. In case of transfer from one Detaining Power to another, the monies which are their property and are not in the currency of the Detaining Power will follow them. They shall be given certificates for any other monies standing to the credit of their accounts.

The Parties to the conflict concerned may agree to notify to each other at specific intervals through the Protecting Power, the amount of the accounts of the prisoners of war.

ARTICLE 66

On the termination of captivity, through the release of a prisoner of war or his repatriation, the Detaining Power shall give him a statement, signed by an authorized officer of that Power, showing the credit balance then due to him. The Detaining Power shall also send through the Protecting Power to the government upon which the prisoner of war depends, lists giving all appropriate particulars of all prisoners of war whose captivity has been terminated by repatriation, release, escape, death or any other means, and showing the amount of their credit balances. Such lists shall be certified on each sheet by an authorized representative of the Detaining Power.

Any of the above provisions of this Article may be varied by mutual agreement between any two Parties to the conflict.

The Power on which the prisoner of war depends shall be responsible for settling with him any credit balance due to him from the Detaining Power on the termination of his captivity.

ARTICLE 67

Advances of pay, issued to prisoners of war in conformity with Article 60, shall be considered as made on behalf of the Power on which they depend. Such advances of pay, as well as all payments made by the said Power under Article 63, third paragraph, and Article 68, shall form the subject of arrangements between the Powers concerned, at the close of hostilities.

ARTICLE 68

Any claim by a prisoner of war for compensation in respect of any injury or other disability arising out of work shall be referred to the Power on which he depends, through the Protecting Power. In accordance with Article 54, the Detaining Power will, in all cases, provide the prisoner of war concerned with a statement showing the nature of the injury or disability, the circumstances in which it arose and particulars of medical or hospital treatment given for it. This statement will be signed by a responsible officer of the Detaining Power and the medical particulars certified by a medical officer.

Any claim by a prisoner of war for compensation in respect of personal effects, monies or valuables impounded by the Detaining Power under Article 18 and not forthcoming on his repatriation, or in respect of loss alleged to be due to the fault of the Detaining Power or any of its servants, shall likewise be referred to the Power on which he depends. Nevertheless, any such personal effects required for use by the prisoners of war whilst in captivity shall be replaced at the expense of the Detaining Power. The Detaining Power will, in all cases, provide the prisoner of war with a statement, signed by a responsible officer, showing all available information regarding the reasons why such effects, monies or valuables have not been restored to him. A copy of this statement will be forwarded to the Power on which he depends through the Central Prisoners of War Agency provided for in Article 123.

SECTION V RELATIONS OF PRISONERS OF WAR WITH THE EXTERIOR

ARTICLE 69

Immediately upon prisoners of war falling into its power, the Detaining Power shall inform them and the Powers on which they depend, through the Protecting Power, of the measures taken to carry out the provisions of the present Section. They shall likewise inform the parties concerned of any subsequent modifications of such measures.

ARTICLE 70

Immediately upon capture, or not more than one week after arrival at a camp, even if it is a transit camp, likewise in case of sickness or transfer to hospital or another camp, every prisoner of war shall be enabled to write direct to his family, on the one hand, and to the Central

Prisoners of War Agency provided for in Article 123, on the other hand, a card similar, if possible, to the model annexed to the present Convention, informing his relatives of his capture, address and state of health. The said cards shall be forwarded as rapidly as possible and may not be delayed in any manner.

ARTICLE 71

Prisoners of war shall be allowed to send and receive letters and cards. If the Detaining Power deems it necessary to limit the number of letters and cards sent by each prisoner of war, the said number shall not be less than two letters and four cards monthly, exclusive of the capture cards provided for in Article 70, and conforming as closely as possible to the models annexed to the present Convention. Further limitations may be imposed only if the Protecting Power is satisfied that it would be in the interests of the prisoners of war concerned to do so owing to difficulties of translation caused by the Detaining Power's inability to find sufficient qualified linguists to carry out the necessary censorship. If limitations must be placed on the correspondence addressed to prisoners of war, they may be ordered only by the Power on which the prisoners depend, possibly at the request of the Detaining Power. Such letters and cards must be conveyed by the most rapid method at the disposal of the Detaining Power; they may not be delayed or retained for disciplinary reasons.

Prisoners of war who have been without news for a long period, or who are unable to receive news from their next of kin or to give them news by the ordinary postal route, as well as those who are at a great distance from their homes, shall be permitted to send telegrams, the fees being charged against the prisoners of war's accounts with the Detaining Power or paid in the currency at their disposal. They shall likewise benefit by this measure in cases of urgency.

As a general rule, the correspondence of prisoners of war shall be written in their native language. The Parties to the conflict may allow correspondence in other languages.

Sacks containing prisoner of war mail must be securely sealed and labeled so as clearly to indicate their contents, and must be addressed to offices of destination.

ARTICLE 72

Prisoners of war shall be allowed to receive by post or by any other means individual parcels or collective shipments containing, in particular, foodstuffs, clothing, medical supplies and articles of a religious, educational or recreational character which may meet their needs, including books, devotional articles, scientific equipment, examination papers, musical instruments, sports outfits and materials allowing prisoners of war to pursue their studies or their cultural activities.

Such shipments shall in no way free the Detaining Power from the obligations imposed upon it by virtue of the present Convention.

The only limits which may be placed on these shipments shall be those proposed by the Protecting Power in the interest of the prisoners themselves, or by the International Committee of the Red Cross or any other organization giving assistance to the prisoners, in respect of their own shipments only, on account of exceptional strain on transport or communications.

The conditions for the sending of individual parcels and collective relief shall, if necessary, be the subject of special agreements between the Powers concerned, which may in no case delay the

receipt by the prisoners of relief supplies. Books may not be included in parcels of clothing and foodstuffs. Medical supplies shall, as a rule, be sent in collective parcels.

ARTICLE 73

In the absence of special agreements between the Powers concerned on the conditions for the receipt and distribution of collective relief shipments, the rules and regulations concerning collective shipments, which are annexed to the present Convention, shall be applied.

The special agreements referred to above shall in no case restrict the right of prisoners' representatives to take possession of collective relief shipments intended for prisoners of war, to proceed to their distribution or to dispose of them in the interest of the prisoners.

Nor shall such agreements restrict the right of representatives of the Protecting Power, the International Committee of the Red Cross or any other organization giving assistance to prisoners of war and responsible for the forwarding of collective shipments, to supervise their distribution to the recipients.

ARTICLE 74

All relief shipments for prisoners of war shall be exempt from import, customs and other dues.

Correspondence, relief shipments and authorized remittances of money addressed to prisoners of war or dispatched by them through the post office, either direct or through the Information Bureau provided for in Article 122 and the Central Prisoners of War Agency provided for in Article 123, shall be exempt from any postal dues, both in the countries of origin and destination, and in intermediate countries.

If relief shipments intended for prisoners of war cannot be sent through the post office by reason of weight or for any other cause, the cost of transportation shall be borne by the Detaining Power in all the territories under its control. The other Powers party to the Convention shall bear the cost of transport in their respective territories.

In the absence of special agreements between the Parties concerned, the costs connected with transport of such shipments, other than costs covered by the above exemption, shall be charged to the senders.

The High Contracting Parties shall endeavor to reduce, so far as possible, the rates charged for telegrams sent by prisoners of war, or addressed to them.

ARTICLE 75

Should military operations prevent the Powers concerned from fulfilling their obligation to assure the transport of the shipments referred to in Articles 70, 71, 72 and 77, the Protecting Powers concerned, the International Committee of the Red Cross or any other organization duly approved by the Parties to the conflict may undertake to ensure the conveyance of such shipments by suitable means (railway wagons, motor vehicles, vessels or aircraft, etc.). For this purpose, the High Contracting Parties shall endeavor to supply them with such transport and to allow its circulation, especially by granting the necessary safe-conducts.

Such transport may also be used to convey:

(a) Correspondence, lists and reports exchanged between the Central Information Agency referred to in Article 123 and the National Bureau referred to in Article 122;

(b) Correspondence and reports relating to prisoners of war which the Protecting Powers, the International Committee of the Red Cross or any other body assisting the prisoners, exchange either with their own delegates or with the Parties to the conflict.

These provisions in no way detract from the right of any Party to the conflict to arrange other means of transport, if it should so prefer, nor preclude the granting of safe-conducts, under mutually agreed conditions, to such means of transport.

In the absence of special agreements, the costs occasioned by the use of such means of transport shall be borne proportionally by the Parties to the conflict whose nationals are benefited thereby.

ARTICLE 76

The censoring of correspondence addressed to prisoners of war or dispatched by them shall be done as quickly as possible. Mail shall be censored only by the dispatching State and the receiving State, and once only by each.

The examination of consignments intended for prisoners of war shall not be carried out under conditions that will expose the goods contained in them to deterioration; except in the case of written or printed matter, it shall be done in the presence of the addressee, or of a fellow-prisoner duly delegated by him. The delivery to prisoners of individual or collective consignments shall not be delayed under the pretext of difficulties of censorship.

Any prohibition of correspondence ordered by Parties to the conflict, either for military or political reasons, shall be only temporary and its duration shall be as short as possible.

ARTICLE 77

The Detaining Powers shall provide all facilities for the transmission, through the Protecting Power or the Central Prisoners of War Agency provided for in Article 123, of instruments, papers or documents intended for prisoners of war or dispatched by them, especially powers of attorney and wills.

In all cases they shall facilitate the preparation and execution of such documents on behalf of prisoners of war; in particular, they shall allow them to consult a lawyer and shall take what measures are necessary for the authentication of their signatures.

SECTION VI RELATIONS BETWEEN PRISONERS OF WAR AND THE AUTHORITIES

CHAPTER I COMPLAINTS OF PRISONERS OF WAR RESPECTING THE CONDITIONS OF CAPTIVITY

ARTICLE 78

Prisoners of war shall have the right to make known to the military authorities in whose power they are, their requests regarding the conditions of captivity to which they are subjected.

They shall also have the unrestricted right to apply to the representatives of the Protecting Powers either through their prisoners' representative or, if they consider it necessary, direct, in order to draw their attention to any points on which they may have complaints to make regarding their conditions of captivity.

These requests and complaints shall not be limited nor considered to be a part of the correspondence quota referred to in Article 71. They must be transmitted immediately. Even if they are recognized to be unfounded, they may not give rise to any punishment.

Prisoners' representatives may send periodic reports on the situation in the camps and the needs of the prisoners of war to the representatives of the Protecting Powers.

CHAPTER II PRISONER OF WAR REPRESENTATIVES

ARTICLE 79

In all places where there are prisoners of war, except in those where there are officers, the prisoners shall freely elect by secret ballot, every six months, and also in case of vacancies, prisoners' representatives entrusted with representing them before the military authorities, the Protecting Powers, the International Committee of the Red Cross and any other organization which may assist them. These prisoners' representatives shall be eligible for re-election.

In camps for officers and persons of equivalent status or in mixed camps, the senior officer among the prisoners of war shall be recognized as the camp prisoners' representative. In camps for officers, he shall be assisted by one or more advisers chosen by the officers; in mixed camps, his assistants shall be chosen from among the prisoners of war who are not officers and shall be elected by them.

Officer prisoners of war of the same nationality shall be stationed in labor camps for prisoners of war, for the purpose of carrying out the camp administration duties for which the prisoners of war are responsible. These officers may be elected as prisoners' representatives under the first paragraph of this Article. In such a case the assistants to the prisoners' representatives shall be chosen from among those prisoners of war who are not officers.

Every representative elected must be approved by the Detaining Power before he has the right to commence his duties. Where the Detaining Power refuses to approve a prisoner of war elected by his fellow prisoners of war, it must inform the Protecting Power of the reason for such refusal.

In all cases the prisoners' representative must have the same nationality, language and customs as the prisoners of war whom he represents. Thus, prisoners of war distributed in different sections of a camp, according to their nationality, language or customs, shall have for each section their own prisoners' representative, in accordance with the foregoing paragraphs.

ARTICLE 80

Prisoners' representatives shall further the physical, spiritual and intellectual well being of prisoners of war.

In particular, where the prisoners decide to organize amongst themselves a system of mutual assistance, this organization will be within the province of the prisoners' representative, in addition to the special duties entrusted to him by other provisions of the present Convention.

Prisoners' representatives shall not be held responsible, simply by reason of their duties, for any offences committed by prisoners of war.

ARTICLE 81

Prisoners' representatives shall not be required to perform any other work, if the accomplishment of their duties is thereby made more difficult.

Prisoners' representatives may appoint from amongst the prisoners such assistants as they may require. All material facilities shall be granted them, particularly a certain freedom of movement necessary for the accomplishment of their duties (inspection of labor detachments, receipt of supplies, etc.).

Prisoners' representatives shall be permitted to visit premises where prisoners of war are detained, and every prisoner of war shall have the right to consult freely his prisoners' representative.

All facilities shall likewise be accorded to the prisoners' representatives for communication by post and telegraph with the detaining authorities, the Protecting Powers, the International Committee of the Red Cross and their delegates, the Mixed Medical Commissions and with the bodies which give assistance to prisoners of war. Prisoners' representatives of labor detachments shall enjoy the same facilities for communication with the prisoners' representatives of the principal camp. Such communications shall not be restricted, nor considered as forming a part of the quota mentioned in Article 71.

Prisoners' representatives who are transferred shall be allowed a reasonable time to acquaint their successors with current affairs.

In case of dismissal, the reasons therefor shall be communicated to the Protecting Power.

CHAPTER III PENAL AND DISCIPLINARY SANCTIONS

I. GENERAL PROVISIONS

ARTICLE 82

A prisoner of war shall be subject to the laws, regulations and orders in force in the armed forces of the Detaining Power; the Detaining Power shall be justified in taking judicial or disciplinary measures in respect of any offence committed by a prisoner of war against such laws, regulations or orders. However, no proceedings or punishments contrary to the provisions of this Chapter shall be allowed.

If any law, regulation or order of the Detaining Power shall declare acts committed by a prisoner of war to be punishable, whereas the same acts would not be punishable if committed by a member of the forces of the Detaining Power, such acts shall entail disciplinary punishments only.

ARTICLE 83

In deciding whether proceedings in respect of an offence alleged to have been committed by a prisoner of war shall be judicial or disciplinary, the Detaining Power shall ensure that the competent authorities exercise the greatest leniency and adopt, wherever possible, disciplinary rather than judicial measures.

ARTICLE 84

A prisoner of war shall be tried only by a military court, unless the existing laws of the Detaining Power expressly permit the civil courts to try a member of the armed forces of the Detaining Power in respect of the particular offence alleged to have been committed by the prisoner of war.

In no circumstances whatever shall a prisoner of war be tried by a court of any kind which does not offer the essential guarantees of independence and impartiality as generally recognized, and, in particular, the procedure of which does not afford the accused the rights and means of defense provided for in Article 105.

ARTICLE 85

Prisoners of war prosecuted under the laws of the Detaining Power for acts committed prior to capture shall retain, even if convicted, the benefits of the present Convention.

ARTICLE 86

No prisoner of war may be punished more than once for the same act, or on the same charge.

ARTICLE 87

Prisoners of war may not be sentenced by the military authorities and courts of the Detaining Power to any penalties except those provided for in respect of members of the armed forces of the said Power who have committed the same acts.

When fixing the penalty, the courts or authorities of the Detaining Power shall take into consideration, to the widest extent possible, the fact that the accused, not being a national of the Detaining Power, is not bound to it by any duty of allegiance, and that he is in its power as the result of circumstances independent of his own will. The said courts or authorities shall be at liberty to reduce the penalty provided for the violation of which the prisoner of war is accused, and shall therefore not be bound to apply the minimum penalty prescribed.

Collective punishment for individual acts, corporal punishments, imprisonment in premises without daylight and, in general, any form of torture or cruelty, are forbidden.

No prisoner of war may be deprived of his rank by the Detaining Power, or prevented from wearing his badges.

ARTICLE 88

Officers, non-commissioned officers and men who are prisoners of war undergoing a disciplinary or judicial punishment, shall not be subjected to more severe treatment than that applied in respect of the same punishment to members of the armed forces of the Detaining Power of equivalent rank.

A woman prisoner of war shall not be awarded or sentenced to a punishment more severe, or treated whilst undergoing punishment more severely, than a woman member of the armed forces of the Detaining Power dealt with for a similar offence.

In no case may a woman prisoner of war be awarded or sentenced to a punishment more severe, or treated whilst undergoing punishment more severely, than a male member of the armed forces of the Detaining Power dealt with for a similar offence.

Prisoners of war who have served disciplinary or judicial sentences may not be treated differently from other prisoners of war.

II. DISCIPLINARY SANCTIONS

ARTICLE 89

The disciplinary punishments applicable to prisoners of war are the following:

1. A fine which shall not exceed 50 per cent of the advances of pay and working pay which the prisoner of war would otherwise receive under the provisions of Articles 60 and 62 during a period of not more than thirty days.

2. Discontinuance of privileges granted over and above the treatment provided for by the present Convention.

3. Fatigue duties not exceeding two hours daily.

4. Confinement.

The punishment referred to under (3) shall not be applied to officers.

In no case shall disciplinary punishments be inhuman, brutal or dangerous to the health of prisoners of war.

ARTICLE 90

The duration of any single punishment shall in no case exceed thirty days. Any period of confinement awaiting the hearing of a disciplinary offence or the award of disciplinary punishment shall be deducted from an award pronounced against a prisoner of war.

The maximum of thirty days provided above may not be exceeded, even if the prisoner of war is answerable for several acts at the same time when he is awarded punishment, whether such acts are related or not.

The period between the pronouncing of an award of disciplinary punishment and its execution shall not exceed one month.

When a prisoner of war is awarded a further disciplinary punishment, a period of at least three days shall elapse between the execution of any two of the punishments, if the duration of one of these is ten days or more.

ARTICLE 91

The escape of a prisoner of war shall be deemed to have succeeded when:

1. He has joined the armed forces of the Power on which he depends, or those of an allied Power;

2. He has left the territory under the control of the Detaining Power, or of an ally of the said Power;

3. He has joined a ship flying the flag of the Power on which he depends, or of an allied Power, in the territorial waters of the Detaining Power, the said ship not being under the control of the last-named Power.

Prisoners of war who have made good their escape in the sense of this Article and who are recaptured, shall not be liable to any punishment in respect of their previous escape.

ARTICLE 92

A prisoner of war who attempts to escape and is recaptured before having made good his escape in the sense of Article 91 shall be liable only to a disciplinary punishment in respect of this act, even if it is a repeated offence.

A prisoner of war who is recaptured shall be handed over without delay to the competent military authority.

Article 88, fourth paragraph, notwithstanding, prisoners of war punished as a result of an unsuccessful escape may be subjected to special surveillance. Such surveillance must not affect the state of their health, must be undergone in a prisoner of war camp, and must not entail the suppression of any of the safeguards granted them by the present Convention.

ARTICLE 93

Escape or attempt to escape, even if it is a repeated offence, shall not be deemed an aggravating circumstance if the prisoner of war is subjected to trial by judicial proceedings in respect of an offence committed during his escape or attempt to escape.

In conformity with the principle stated in Article 83, offences committed by prisoners of war with the sole intention of facilitating their escape and which do not entail any violence against life or limb, such as offences against public property, theft without intention of self-enrichment, the drawing up or use of false papers, the wearing of civilian clothing, shall occasion disciplinary punishment only.

Prisoners of war who aid or abet an escape or an attempt to escape shall be liable on this count to disciplinary punishment only.

ARTICLE 94

If an escaped prisoner of war is recaptured, the Power on which he depends shall be notified thereof in the manner defined in Article 122, provided notification of his escape has been made.

ARTICLE 95

A prisoner of war accused of an offence against discipline shall not be kept in confinement pending the hearing unless a member of the armed forces of the Detaining Power would be so kept if he were accused of a similar offence, or if it is essential in the interests of camp order and discipline.

Any period spent by a prisoner of war in confinement awaiting the disposal of an offence against discipline shall be reduced to an absolute minimum and shall not exceed fourteen days.

The provisions of Articles 97 and 98 of this Chapter shall apply to prisoners of war who are in confinement awaiting the disposal of offences against discipline.

ARTICLE 96

Acts which constitute offences against discipline shall be investigated immediately.

Without prejudice to the competence of courts and superior military authorities, disciplinary punishment may be ordered only by an officer having disciplinary powers in his capacity as camp commander, or by a responsible officer who replaces him or to whom he has delegated his disciplinary powers.

In no case may such powers be delegated to a prisoner of war or be exercised by a prisoner of war.

Before any disciplinary award is pronounced, the accused shall be given precise information regarding the offences of which he is accused, and given an opportunity of explaining his conduct and of defending himself. He shall be permitted, in particular, to call witnesses and to have recourse, if necessary, to the services of a qualified interpreter. The decision shall be announced to the accused prisoner of war and to the prisoners' representative.

A record of disciplinary punishments shall be maintained by the camp commander and shall be open to inspection by representatives of the Protecting Power.

ARTICLE 97

Prisoners of war shall not in any case be transferred to penitentiary establishments (prisons, penitentiaries, convict prisons, etc.) to undergo disciplinary punishment therein.

All premises in which disciplinary punishments are undergone shall conform to the sanitary requirements set forth in Article 25. A prisoner of war undergoing punishment shall be enabled to keep himself in a state of cleanliness, in conformity with Article 29.

Officers and persons of equivalent status shall not be lodged in the same quarters as non-commissioned officers or men.

Women prisoners of war undergoing disciplinary punishment shall be confined in separate quarters from male prisoners of war and shall be under the immediate supervision of women.

ARTICLE 98

A prisoner of war undergoing confinement as a disciplinary punishment, shall continue to enjoy the benefits of the provisions of this Convention except in so far as these are necessarily rendered inapplicable by the mere fact that he is confined. In no case may he be deprived of the benefits of the provisions of Articles 78 and 126.

A prisoner of war awarded disciplinary punishment may not be deprived of the prerogatives attached to his rank.

Prisoners of war awarded disciplinary punishment shall be allowed to exercise and to stay in the open air at least two hours daily.

They shall be allowed, on their request, to be present at the daily medical inspections. They shall receive the attention which their state of health requires and, if necessary, shall be removed to the camp infirmary or to a hospital.

They shall have permission to read and write, likewise to send and receive letters. Parcels and remittances of money, however, may be withheld from them until the completion of the punishment; they shall meanwhile be entrusted to the prisoners' representative, who will hand over to the infirmary the perishable goods contained in such parcels.

III. JUDICIAL PROCEEDINGS

ARTICLE 99

No prisoner of war may be tried or sentenced for an act which is not forbidden by the law of the Detaining Power or by international law, in force at the time the said act was committed.

No moral or physical coercion may be exerted on a prisoner of war in order to induce him to admit himself guilty of the act of which he is accused.

No prisoner of war may be convicted without having had an opportunity to present his defense and the assistance of a qualified advocate or counsel.

ARTICLE 100

Prisoners of war and the Protecting Powers shall be informed as soon as possible of the offences which are punishable by the death sentence under the laws of the Detaining Power.

Other offences shall not thereafter be made punishable by the death penalty without the concurrence of the Power upon which the prisoners of war depend.

The death sentence cannot be pronounced on a prisoner of war unless the attention of the court has, in accordance with Article 87, second paragraph, been particularly called to the fact that since the accused is not a national of the Detaining Power, he is not bound to it by any duty of allegiance, and that he is in its power as the result of circumstances independent of his own will.

ARTICLE 101

If the death penalty is pronounced on a prisoner of war, the sentence shall not be executed before the expiration of a period of at least six months from the date when the Protecting Power receives, at an indicated address, the detailed communication provided for in Article 107.

ARTICLE 102

A prisoner of war can be validly sentenced only if the sentence has been pronounced by the same courts according to the same procedure as in the case of members of the armed forces of the Detaining Power, and if, furthermore, the provisions of the present Chapter have been observed.

ARTICLE 103

Judicial investigations relating to a prisoner of war shall be conducted as rapidly as circumstances permit and so that his trial shall take place as soon as possible. A prisoner of war shall not be confined while awaiting trial unless a member of the armed forces of the Detaining Power would be so confined if he were accused of a similar offence, or if it is essential to do so in the interests of national security. In no circumstances shall this confinement exceed three months.

Any period spent by a prisoner of war in confinement awaiting trial shall be deducted from any sentence of imprisonment passed upon him and taken into account in fixing any penalty.

The provisions of Articles 97 and 98 of this Chapter shall apply to a prisoner of war whilst in confinement awaiting trial.

ARTICLE 104

In any case in which the Detaining Power has decided to institute judicial proceedings against a prisoner of war, it shall notify the Protecting Power as soon as possible and at least three weeks before the opening of the trial. This period of three weeks shall run as from the day on which such notification reaches the Protecting Power at the address previously indicated by the latter to the Detaining Power.

The said notification shall contain the following information:

1. Surname and first names of the prisoner of war, his rank, his army, regimental, personal or serial number, his date of birth, and his profession or trade, if any;

2. Place of internment or confinement;

3. Specification of the charge or charges on which the prisoner of war is to be arraigned, giving the legal provisions applicable;

4 . Designation of the court which will try the case, likewise the date and place fixed for the opening of the trial.

The same communication shall be made by the Detaining Power to the prisoners' representative.

If no evidence is submitted, at the opening of a trial, that the notification referred to above was received by the Protecting Power, by the prisoner of war and by the prisoners' representative concerned, at least three weeks before the opening of the trial, then the latter cannot take place and must be adjourned.

ARTICLE 105

The prisoner of war shall be entitled to assistance by one of his prisoner comrades, to defense by a qualified advocate or counsel of his own choice, to the calling of witnesses and, if he deems necessary, to the services of a competent interpreter. He shall be advised of these rights by the Detaining Power in due time before the trial.

Failing a choice by the prisoner of war, the Protecting Power shall find him an advocate or counsel, and shall have at least one week at its disposal for the purpose. The Detaining Power shall deliver to the said Power, on request, a list of persons qualified to present the defense. Failing a choice of an advocate or counsel by the prisoner of war or the Protecting Power, the Detaining Power shall appoint a competent advocate or counsel to conduct the defense.

The advocate or counsel conducting the defense on behalf of the prisoner of war shall have at his disposal a period of two weeks at least before the opening of the trial, as well as the necessary facilities to prepare the defense of the accused. He may, in particular, freely visit the accused and interview him in private. He may also confer with any witnesses for the defense, including prisoners of war. He shall have the benefit of these facilities until the term of appeal or petition has expired.

Particulars of the charge or charges on which the prisoner of war is to be arraigned, as well as the documents which are generally communicated to the accused by virtue of the laws in force in the armed forces of the Detaining Power, shall be communicated to the accused prisoner of war in a language which he understands, and in good time before the opening of the trial. The same communication in the same circumstances shall be made to the advocate or counsel conducting the defense on behalf of the prisoner of war.

The representatives of the Protecting Power shall be entitled to attend the trial of the case, unless, exceptionally, this is held in camera in the interest of State security. In such a case the Detaining Power shall advise the Protecting Power accordingly.

ARTICLE 106

Every prisoner of war shall have, in the same manner as the members of the armed forces of the Detaining Power, the right of appeal or petition from any sentence pronounced upon him, with a view to the quashing or revising of the sentence or the reopening of the trial. He shall be fully informed of his right to appeal or petition and of the time limit within which he may do so.

ARTICLE 107

Any judgment and sentence pronounced upon a prisoner of war shall be immediately reported to the Protecting Power in the form of a summary communication, which shall also indicate whether he has the right of appeal with a view to the quashing of the sentence or the reopening of the trial. This communication shall likewise be sent to the prisoners' representative concerned. It shall also be sent to the accused prisoner of war in a language he understands, if the sentence was not pronounced in his presence. The Detaining Power shall also immediately communicate to the Protecting Power the decision of the prisoner of war to use or to waive his right of appeal.

Furthermore, if a prisoner of war is finally convicted or if a sentence pronounced on a prisoner of war in the first instance is a death sentence, the Detaining Power shall as soon as possible address to the Protecting Power a detailed communication containing:

1. The precise wording of the finding and sentence;

2. A summarized report of any preliminary investigation and of the trial, emphasizing in particular the elements of the prosecution and the defense;

3. Notification, where applicable, of the establishment where the sentence will be served.

The communications provided for in the foregoing subparagraphs shall be sent to the Protecting Power at the address previously made known to the Detaining Power.

ARTICLE 108

Sentences pronounced on prisoners of war after a conviction has become duly enforceable, shall be served in the same establishments and under the same conditions as in the case of members of the armed forces of the Detaining Power. These conditions shall in all cases conform to the requirements of health and humanity.

A woman prisoner of war on whom such a sentence has been pronounced shall be confined in separate quarters and shall be under the supervision of women.

In any case, prisoners of war sentenced to a penalty depriving them of their liberty shall retain the benefit of the provisions of Articles 78 and 126 of the present Convention. Furthermore, they shall be entitled to receive and dispatch correspondence, to receive at least one relief parcel monthly, to take regular exercise in the open air, to have the medical care required by their state of health, and the spiritual assistance they may desire. Penalties to which they may be subjected shall be in accordance with the provisions of Article 87, third paragraph.

PART IV TERMINATION OF CAPTIVITY

SECTION I DIRECT REPATRIATION AND ACCOMMODATION IN NEUTRAL COUNTRIES

ARTICLE 109

Subject to the provisions of the third paragraph of this Article, Parties to the conflict are bound to send back to their own country, regardless of number or rank, seriously wounded and seriously sick prisoners of war, after having cared for them until they are fit to travel, in accordance with the first paragraph of the following Article.

Throughout the duration of hostilities, Parties to the conflict shall endeavor, with the cooperation of the neutral Powers concerned, to make arrangements for the accommodation in neutral countries of the sick and wounded prisoners of war referred to in the second paragraph of the following Article. They may, in addition, conclude agreements with a view to the direct repatriation or internment in a neutral country of able-bodied prisoners of war who have undergone a long period of captivity.

No sick or injured prisoner of war who is eligible for repatriation under the first paragraph of this Article, may be repatriated against his will during hostilities.

ARTICLE 110

The following shall be repatriated direct:

1. Incurably wounded and sick whose mental or physical fitness seems to have been gravely diminished.

2. Wounded and sick who, according to medical opinion, are not likely to recover within one year, whose condition requires treatment and whose mental or physical fitness seems to have been gravely diminished.

3. Wounded and sick who have recovered, but whose mental or physical fitness seems to have been gravely and permanently diminished.

The following may be accommodated in a neutral country:

1. Wounded and sick whose recovery may be expected within one year of the date of the wound or the beginning of the illness, if treatment in a neutral country might increase the prospects of a more certain and speedy recovery.

2. Prisoners of war whose mental or physical health, according to medical opinion, is seriously threatened by continued captivity, but whose accommodation in a neutral country might remove such a threat.

The conditions which prisoners of war accommodated in a neutral country must fulfil in order to permit their repatriation shall be fixed, as shall likewise their status, by agreement between the Powers concerned. In general, prisoners of war who have been accommodated in a neutral country, and who belong to the following categories, should be repatriated:

1. Those whose state of health has deteriorated so as to fulfil the conditions laid down for direct repatriation;

2. Those whose mental or physical powers remain, even after treatment, considerably impaired.

If no special agreements are concluded between the Parties to the conflict concerned, to determine the cases of disablement or sickness entailing direct repatriation or accommodation in a neutral country, such cases shall be settled in accordance with the principles laid down in the Model Agreement concerning direct repatriation and accommodation in neutral countries of wounded and sick prisoners of war and in the Regulations concerning Mixed Medical Commissions annexed to the present Convention.

ARTICLE 111

The Detaining Power, the Power on which the prisoners of war depend, and a neutral Power agreed upon by these two Powers, shall endeavor to conclude agreements which will enable prisoners of war to be interned in the territory of the said neutral Power until the close of hostilities.

ARTICLE 112

Upon the outbreak of hostilities, Mixed Medical Commissions shall be appointed to examine sick and wounded prisoners of war, and to make all appropriate decisions regarding them. The appointment, duties and functioning of these Commissions shall be in conformity with the provisions of the Regulations annexed to the present Convention.

However, prisoners of war who, in the opinion of the medical authorities of the Detaining Power, are manifestly seriously injured or seriously sick, may be repatriated without having to be examined by a Mixed Medical Commission.

ARTICLE 113

Besides those who are designated by the medical authorities of the Detaining Power, wounded or sick prisoners of war belonging to the categories listed below shall be entitled to present themselves for examination by the Mixed Medical Commissions provided for in the foregoing Article:

1. Wounded and sick proposed by a physician or surgeon who is of the same nationality, or a national of a Party to the conflict allied with the Power on which the said prisoners depend, and who exercises his functions in the camp.

2. Wounded and sick proposed by their prisoners' representative.

3. Wounded and sick proposed by the Power on which they depend, or by an organization duly recognized by the said Power and giving assistance to the prisoners.

Prisoners of war who do not belong to one of the three foregoing categories may nevertheless present themselves for examination by Mixed Medical Commissions, but shall be examined only after those belonging to the said categories.

The physician or surgeon of the same nationality as the prisoners who present themselves for examination by the Mixed Medical Commission, likewise the prisoners' representative of the said prisoners, shall have permission to be present at the examination.

ARTICLE 114

Prisoners of war who meet with accidents shall, unless the injury is self-inflicted, have the benefit of the provisions of this Convention as regards repatriation or accommodation in a neutral country.

ARTICLE 115

No prisoner of war on whom a disciplinary punishment has been imposed and who is eligible for repatriation or for accommodation in a neutral country, may be kept back on the plea that he has not undergone his punishment.

Prisoners of war detained in connection with a judicial prosecution or conviction and who are designated for repatriation or accommodation in a neutral country, may benefit by such measures before the end of the proceedings or the completion of the punishment, if the Detaining Power consents.

Parties to the conflict shall communicate to each other the names of those who will be detained until the end of the proceedings or the completion of the punishment.

ARTICLE 116

The costs of repatriating prisoners of war or of transporting them to a neutral country shall be borne, from the frontiers of the Detaining Power, by the Power on which the said prisoners depend.

ARTICLE 117

No repatriated person may be employed on active military service.

SECTION II RELEASE AND REPATRIATION OF PRISONERS OF WAR AT THE CLOSE OF HOSTILITIES

ARTICLE 118

Prisoners of war shall be released and repatriated without delay after the cessation of active hostilities.

In the absence of stipulations to the above effect in any agreement concluded between the Parties to the conflict with a view to the cessation of hostilities, or failing any such agreement, each of the Detaining Powers shall itself establish and execute without delay a plan of repatriation in conformity with the principle laid down in the foregoing paragraph.

In either case, the measures adopted shall be brought to the knowledge of the prisoners of war.

The costs of repatriation of prisoners of war shall in all cases be equitably apportioned between the Detaining Power and the Power on which the prisoners depend. This apportionment shall be carried out on the following basis:

(a) If the two Powers are contiguous, the Power on which the prisoners of war depend shall bear the costs of repatriation from the frontiers of the Detaining Power.

(b) If the two Powers are not contiguous, the Detaining Power shall bear the costs of transport of prisoners of war over its own territory as far as its frontier or its port of embarkation nearest to the territory of the Power on which the prisoners of war depend. The Parties concerned shall agree between themselves as to the equitable apportionment of the remaining costs of the repatriation. The conclusion of this agreement shall in no circumstances justify any delay in the repatriation of the prisoners of war.

ARTICLE 119

Repatriation shall be effected in conditions similar to those laid down in Articles 46 to 48 inclusive of the present Convention for the transfer of prisoners of war, having regard to the provisions of Article 118 and to those of the following paragraphs.

On repatriation, any articles of value impounded from prisoners of war under Article 18, and any foreign currency which has not been converted into the currency of the Detaining Power, shall be restored to them. Articles of value and foreign currency which, for any reason whatever, are not restored to prisoners of war on repatriation, shall be dispatched to the Information Bureau set up under Article 122.

Prisoners of war shall be allowed to take with them their personal effects, and any correspondence and parcels which have arrived for them. The weight of such baggage may be limited, if the conditions of repatriation so require, to what each prisoner can reasonably carry. Each prisoner shall in all cases be authorized to carry at least twenty-five kilograms.

The other personal effects of the repatriated prisoner shall be left in the charge of the Detaining Power which shall have them forwarded to him as soon as it has concluded an agreement to this effect, regulating the conditions of transport and the payment of the costs involved, with the Power on which the prisoner depends.

Prisoners of war against whom criminal proceedings for an indictable offence are pending may be detained until the end of such proceedings, and, if necessary, until the completion of the punishment. The same shall apply to prisoners of war already convicted for an indictable offence.

Parties to the conflict shall communicate to each other the names of any prisoners of war who are detained until the end of the proceedings or until punishment has been completed.

By agreement between the Parties to the conflict, commissions shall be established for the purpose of searching for dispersed prisoners of war and of assuring their repatriation with the least possible delay.

SECTION III DEATH OF PRISONERS OF WAR

ARTICLE 120

Wills of prisoners of war shall be drawn up so as to satisfy the conditions of validity required by the legislation of their country of origin, which will take steps to inform the Detaining Power of its requirements in this respect. At the request of the prisoner of war and, in all cases, after death, the will shall be transmitted without delay to the Protecting Power; a certified copy shall be sent to the Central Agency.

Death certificates in the form annexed to the present Convention, or lists certified by a responsible officer, of all persons who die as prisoners of war shall be forwarded as rapidly as possible to the Prisoner of War Information Bureau established in accordance with Article 122. The death certificates or certified lists shall show particulars of identity as set out in the third paragraph of Article 17, and also the date and place of death, the cause of death, the date and place of burial and all particulars necessary to identify the graves.

The burial or cremation of a prisoner of war shall be preceded by a medical examination of the body with a view to confirming death and enabling a report to be made and, where necessary, establishing identity.

The detaining authorities shall ensure that prisoners of war who have died in captivity are honorably buried, if possible according to the rites of the religion to which they belonged, and that their graves are respected, suitably maintained and marked so as to be found at any time. Wherever possible, deceased prisoners of war who depended on the same Power shall be interred in the same place.

Deceased prisoners of war shall be buried in individual graves unless unavoidable circumstances require the use of collective graves. Bodies may be cremated only for imperative reasons of hygiene, on account of the religion of the deceased or in accordance with his express wish to this effect. In case of cremation, the fact shall be stated and the reasons given in the death certificate of the deceased.

In order that graves may always be found, all particulars of burials and graves shall be recorded with a Graves Registration Service established by the Detaining Power. Lists of graves and particulars of the prisoners of war interred in cemeteries and elsewhere shall be transmitted to the Power on which such prisoners of war depended. Responsibility for the care of these graves and for records of any subsequent moves of the bodies shall rest on the Power controlling the territory, if a Party to the present Convention. These provisions shall also apply to the ashes, which shall be kept by the Graves Registration Service until proper disposal thereof in accordance with the wishes of the home country.

ARTICLE 121

Every death or serious injury of a prisoner of war caused or suspected to have been caused by a sentry, another prisoner of war, or any other person, as well as any death the cause of which is unknown, shall be immediately followed by an official enquiry by the Detaining Power.

A communication on this subject shall be sent immediately to the Protecting Power. Statements shall be taken from witnesses, especially from those who are prisoners of war, and a report including such statements shall be forwarded to the Protecting Power.

If the enquiry indicates the guilt of one or more persons, the Detaining Power shall take all measures for the prosecution of the person or persons responsible.

PART V INFORMATION BUREAU AND RELIEF SOCIETIES FOR PRISONERS OF WAR

ARTICLE 122

Upon the outbreak of a conflict and in all cases of occupation, each of the Parties to the conflict shall institute an official Information Bureau for prisoners of war who are in its power. Neutral or non-belligerent Powers who may have received within their territory persons belonging to one of the categories referred to in Article 4, shall take the same action with respect to such persons. The Power concerned shall ensure that the Prisoners of War Information Bureau is provided with the necessary accommodation, equipment and staff to ensure its efficient working. It shall be at liberty to employ prisoners of war in such a Bureau under the conditions laid down in the Section of the present Convention dealing with work by prisoners of war.

Within the shortest possible period, each of the Parties to the conflict shall give its Bureau the information referred to in the fourth, fifth and sixth paragraphs of this Article regarding any enemy person belonging to one of the categories referred to in Article 4, who has fallen into its power. Neutral or non-belligerent Powers shall take the same action with regard to persons belonging to such categories whom they have received within their territory.

The Bureau shall immediately forward such information by the most rapid means to the Powers concerned, through the intermediary of the Protecting Powers and likewise of the Central Agency provided for in Article 123.

This information shall make it possible quickly to advise the next of kin concerned. Subject to the provisions of Article 17, the information shall include, in so far as available to the Information Bureau, in respect of each prisoner of war, his surname, first names, rank, army, regimental, personal or serial number, place and full date of birth, indication of the Power on which he depends, first name of the father and maiden name of the mother, name and address of the person to be informed and the address to which correspondence for the prisoner may be sent.

The Information Bureau shall receive from the various departments concerned information regarding transfers, releases, repatriations, escapes, admissions to hospital, and deaths, and shall transmit such information in the manner described in the third paragraph above.

Likewise, information regarding the state of health of prisoners of war who are seriously ill or seriously wounded shall be supplied regularly, every week if possible.

The Information Bureau shall also be responsible for replying to all inquiries sent to it concerning prisoners of war, including those who have died in captivity; it will make any inquiries necessary to obtain the information which is asked for if this is not in its possession.

All written communications made by the Bureau shall be authenticated by a signature or a seal.

The Information Bureau shall furthermore be charged with collecting all personal valuables, including sums in currencies other than that of the Detaining Power and documents of importance to the next of kin, left by prisoners of war who have been repatriated or released, or who have escaped or died, and shall forward the said valuables to the Powers concerned. Such articles shall be sent by the Bureau in sealed packets which shall be accompanied by statements giving clear and full particulars of the identity of the person to whom the articles belonged, and by a complete list of the contents of the parcel. Other personal effects of such prisoners of war shall be transmitted under arrangements agreed upon between the Parties to the conflict concerned.

ARTICLE 123

A Central Prisoners of War Information Agency shall be created in a neutral country. The International Committee of the Red Cross shall, if it deems necessary, propose to the Powers concerned the organization of such an Agency.

The function of the Agency shall be to collect all the information it may obtain through official or private channels respecting prisoners of war, and to transmit it as rapidly as possible to the country of origin of the prisoners of war or to the Power on which they depend. It shall receive from the Parties to the conflict all facilities for effecting such transmissions.

The High Contracting Parties, and in particular those whose nationals benefit by the services of the Central Agency, are requested to give the said Agency the financial aid it may require.

The foregoing provisions shall in no way be interpreted as restricting the humanitarian activities of the International Committee of the Red Cross, or of the relief Societies provided for in Article 125.

ARTICLE 124

The national Information Bureau and the Central Information Agency shall enjoy free postage for mail, likewise all the exemptions provided for in Article 74, and further, so far as possible, exemption from telegraphic charges or, at least, greatly reduced rates.

ARTICLE 125

Subject to the measures which the Detaining Powers may consider essential to ensure their security or to meet any other reasonable need, the representatives of religious organizations, relief societies, or any other organization assisting prisoners of war, shall receive from the said Powers, for themselves and their duly accredited agents, all necessary facilities for visiting the prisoners, distributing relief supplies and material, from any source, intended for religious, educational or recreative purposes, and for assisting them in organizing their leisure time within the camps. Such societies or organizations may be constituted in the territory of the Detaining Power or in any other country, or they may have an international character.

The Detaining Power may limit the number of societies and organizations whose delegates are allowed to carry out their activities in its territory and under its supervision, on condition, however, that such limitation shall not hinder the effective operation of adequate relief to all prisoners of war.

The special position of the International Committee of the Red Cross in this field shall be recognized and respected at all times.

As soon as relief supplies or material intended for the above-mentioned purposes are handed over to prisoners of war, or very shortly afterwards, receipts for each consignment, signed by the prisoners' representative, shall be forwarded to the relief society or organization making the shipment. At the same time, receipts for these consignments shall be supplied by the administrative authorities responsible for guarding the prisoners.

PART VI EXECUTION OF THE CONVENTION

SECTION I GENERAL PROVISIONS

ARTICLE 126

Representatives or delegates of the Protecting Powers shall have permission to go to all places where prisoners of war may be, particularly to places of internment, imprisonment and labor, and shall have access to all premises occupied by prisoners of war; they shall also be allowed to go to the places of departure, passage and arrival of prisoners who are being transferred. They shall be able to interview the prisoners, and in particular the prisoners' representatives, without witnesses, either personally or through an interpreter.

Representatives and delegates of the Protecting Powers shall have full liberty to select the places they wish to visit. The duration and frequency of these visits shall not be restricted. Visits may not be prohibited except for reasons of imperative military necessity, and then only as an exceptional and temporary measure.

The Detaining Power and the Power on which the said prisoners of war depend may agree, if necessary, that compatriots of these prisoners of war be permitted to participate in the visits.

The delegates of the International Committee of the Red Cross shall enjoy the same prerogatives. The appointment of such delegates shall be submitted to the approval of the Power detaining the prisoners of war to be visited.

ARTICLE 127

The High Contracting Parties undertake, in time of peace as in time of war, to disseminate the text of the present Convention as widely as possible in their respective countries, and, in particular, to include the study thereof in their programs of military and, if possible, civil instruction, so that the principles thereof may become known to all their armed forces and to the entire population.

Any military or other authorities, who in time of war assume responsibilities in respect of prisoners of war, must possess the text of the Convention and be specially instructed as to its provisions.

ARTICLE 128

The High Contracting Parties shall communicate to one another through the Swiss Federal Council and, during hostilities, through the Protecting Powers, the official translations of the

present Convention, as well as the laws and regulations which they may adopt to ensure the application thereof.

ARTICLE 129

The High Contracting Parties undertake to enact any legislation necessary to provide effective penal sanctions for persons committing, or ordering to be committed, any of the grave breaches of the present Convention defined in the following Article.

Each High Contracting Party shall be under the obligation to search for persons alleged to have committed, or to have ordered to be committed, such grave breaches, and shall bring such persons, regardless of their nationality, before its own courts. It may also, if it prefers, and in accordance with the provisions of its own legislation, hand such persons over for trial to another High Contracting Party concerned, provided such High Contracting Party has made out a prima facie case.

Each High Contracting Party shall take measures necessary for the suppression of all acts contrary to the provisions of the present Convention other than the grave breaches defined in the following Article.

In all circumstances, the accused persons shall benefit by safeguards of proper trial and defense, which shall not be less favorable than those provided by Article 105 and those following of the present Convention.

ARTICLE 130

Grave breaches to which the preceding Article relates shall be those involving any of the following acts, if committed against persons or property protected by the Convention: willful killing, torture or inhuman treatment, including biological experiments, willfully causing great suffering or serious injury to body or health, compelling a prisoner of war to serve in the forces of the hostile Power, or willfully depriving a prisoner of war of the rights of fair and regular trial prescribed in this Convention.

ARTICLE 131

No High Contracting Party shall be allowed to absolve itself or any other High Contracting Party of any liability incurred by itself or by another High Contracting Party in respect of breaches referred to in the preceding Article.

ARTICLE 132

At the request of a Party to the conflict, an enquiry shall be instituted, in a manner to be decided between the interested Parties, concerning any alleged violation of the Convention.

If agreement has not been reached concerning the procedure for the enquiry, the Parties should agree on the choice of an umpire who will decide upon the procedure to be followed.

Once the violation has been established, the Parties to the conflict shall put an end to it and shall repress it with the least possible delay.

SECTION II FINAL PROVISIONS

ARTICLE 133

The present Convention is established in English and in French. Both texts are equally authentic. The Swiss Federal Council shall arrange for official translations of the Convention to be made in the Russian and Spanish languages.

ARTICLE 134

The present Convention replaces the Convention of 27 July 1929, in relations between the High Contracting Parties.

ARTICLE 135

In the relations between the Powers which are bound by The Hague Convention respecting the Laws and Customs of War on Land, whether that of July 29, 1899, or that of October 18, 1907, and which are parties to the present Convention, this last Convention shall be complementary to Chapter II of the Regulations annexed to the above-mentioned Conventions of The Hague.

ARTICLE 136

The present Convention, which bears the date of this day, is open to signature until February 12, 1950, in the name of the Powers represented at the Conference which opened at Geneva on April 21, 1949; furthermore, by Powers not represented at that Conference, but which are parties to the Convention of July 27, 1929.

ARTICLE 137

The present Convention shall be ratified as soon as possible and the ratifications shall be deposited at Berne.

A record shall be drawn up of the deposit of each instrument of ratification and certified copies of this record shall be transmitted by the Swiss Federal Council to all the Powers in whose name the Convention has been signed, or whose accession has been notified.

ARTICLE 138

The present Convention shall come into force six months after not less than two instruments of ratification have been deposited.

Thereafter, it shall come into force for each High Contracting Party six months after the deposit of the instrument of ratification.

ARTICLE 139

From the date of its coming into force, it shall be open to any Power in whose name the present Convention has not been signed, to accede to this Convention.

ARTICLE 140

Accessions shall be notified in writing to the Swiss Federal Council, and shall take effect six months after the date on which they are received.

The Swiss Federal Council shall communicate the accessions to all the Powers in whose name the Convention has been signed, or whose accession has been notified.

ARTICLE 141

The situations provided for in Articles 2 and 3 shall give immediate effect to ratifications deposited and accessions notified by the Parties to the conflict before or after the beginning of hostilities or occupation. The Swiss Federal Council shall communicate by the quickest method any ratifications or accessions received from Parties to the conflict.

ARTICLE 142

Each of the High Contracting Parties shall be at liberty to denounce the present Convention.

The denunciation shall be notified in writing to the Swiss Federal Council, which shall transmit it to the Governments of all the High Contracting Parties.

The denunciation shall take effect one year after the notification thereof has been made to the Swiss Federal Council. However, a denunciation of which notification has been made at a time when the denouncing Power is involved in a conflict shall not take effect until peace has been concluded, and until after operations connected with the release and repatriation of the persons protected by the present Convention have been terminated.

The denunciation shall have effect only in respect of the denouncing Power. It shall in no way impair the obligations which the Parties to the conflict shall remain bound to fulfill by virtue of the principles of the law of nations, as they result from the usages established among civilized peoples, from the laws of humanity and the dictates of the public conscience.

ARTICLE 143

The Swiss Federal Council shall register the present Convention with the Secretariat of the United Nations. The Swiss Federal Council shall also inform the Secretariat of the United Nations of all ratifications, accessions and denunciations received by it with respect to the present Convention.

IN WITNESS WHEREOF the undersigned, having deposited their respective full powers, have signed the present Convention.

DONE at Geneva this twelfth day of August 1949, in the English and French languages. The original shall be deposited in the Archives of the Swiss Confederation. The Swiss Federal Council shall transmit certified copies thereof to each of the signatory and acceding States.

SECTION II. GENEVA CONVENTIONS RELATIVE TO THE PROTECTION OF CIVILIAN PERSONS IN TIME OF WAR (FOURTH GENEVA CONVENTION)

The following excerpted articles from the Geneva Conventions contain requirements concerning the treatment of civilians during time of war. Violations of these articles can constitute war crimes and should be treated as such.

PART I

GENERAL PROVISIONS

Article 1

The High Contracting Parties undertake to respect and to ensure respect for the present Convention in all circumstances.

Article 2

In addition to the provisions which shall be implemented in peacetime, the present Convention shall apply to all cases of declared war or of any other armed conflict which may arise between two or more of the High Contracting Parties, even if the state of war is not recognized by one of them.

The Convention shall also apply to all cases of partial or total occupation of the territory of a High Contracting Party, even if the said occupation meets with no armed resistance.

Although one of the Powers in conflict may not be a party to the present Convention, the Powers who are parties thereto shall remain bound by it in their mutual relations. They shall furthermore be bound by the Convention in relation to the said Power, if the latter accepts and applies the provisions thereof.

Article 3

In the case of armed conflict not of an international character occurring in the territory of one of the High Contracting Parties, each Party to the conflict shall be bound to apply, as a minimum, the following provisions:

1. Persons taking no active part in the hostilities, including members of armed forces who have laid down their arms and those placed hors de combat by sickness, wounds, detention, or any other cause, shall in all circumstances be treated humanely, without any adverse distinction founded on race, colour, religion or faith, sex, birth or wealth, or any other similar criteria.

To this end, the following acts are and shall remain prohibited at any time and in any place whatsoever with respect to the above-mentioned persons:

(a) Violence to life and person, in particular murder of all kinds, mutilation, cruel treatment and torture;

(b) Taking of hostages;

(c) Outrages upon personal dignity, in particular humiliating and degrading treatment;

(d) The passing of sentences and the carrying out of executions without previous judgment pronounced by a regularly constituted court, affording all the judicial guarantees which are recognized as indispensable by civilized peoples.

2. The wounded and sick shall be collected and cared for.

An impartial humanitarian body, such as the International Committee of the Red Cross, may offer its services to the Parties to the conflict.

The Parties to the conflict should further endeavour to bring into force, by means of special agreements, all or part of the other provisions of the present Convention.

The application of the preceding provisions shall not affect the legal status of the Parties to the conflict.

Article 4

Persons protected by the Convention are those who, at a given moment and in any manner whatsoever, find themselves, in case of a conflict or occupation, in the hands of a Party to the conflict or Occupying Power of which they are not nationals.
Nationals of a State which is not bound by the Convention are not protected by it.

Nationals of a neutral State who find themselves in the territory of a belligerent State, and nationals of a co-belligerent State, shall not be regarded as protected persons while the State of which they are nationals has normal diplomatic representation in the State in whose hands they are.

The provisions of Part II are, however, wider in application, as defined in Article 13.

Persons protected by the Geneva Convention for the Amelioration of the Condition of the Wounded and Sick in Armed Forces in the Field of August 12, 1949, or by the Geneva Convention for the Amelioration of the Condition of Wounded, Sick and Shipwrecked Members of Armed Forces at Sea of August 12, 1949, or by the Geneva Convention relative to the Treatment of Prisoners of War of August 12, 1949, shall not be considered as protected persons within the meaning of the present Convention.

Article 5

Where, in the territory of a Party to the conflict, the latter is satisfied that an individual protected person is definitely suspected of or engaged in activities hostile to the security of the State, such individual person shall not be entitled to claim such rights and privileges under the present Convention as would, if exercised in the favour of such individual person, be prejudicial to the security of such State.

Where in occupied territory an individual protected person is detained as a spy or saboteur, or as a person under definite suspicion of activity hostile to the security of the Occupying Power, such person shall, in those cases where absolute military security so requires, be regarded as having forfeited rights of communication under the present Convention.

In each case, such persons shall nevertheless be treated with humanity, and in case of trial, shall not be deprived of the rights of fair and regular trial prescribed by the present Convention. They shall also be granted the full rights and privileges of a protected person under the present Convention at the earliest date consistent with the security of the State or Occupying Power, as the case may be.

Article 25

All persons in the territory of a Party to the conflict, or in a territory occupied by it, shall be enabled to give news of a strictly personal nature to members of their families, wherever they may be, and to receive news from them. This correspondence shall be forwarded speedily and without undue delay.

If, as a result of circumstances, it becomes difficult or impossible to exchange family correspondence by the ordinary post, the Parties to the conflict concerned shall apply to a neutral intermediary, such as the Central Agency provided for in Article 140, and shall decide in consultation with it how to ensure the fulfillment of their obligations under the best possible conditions, in particular with the cooperation of the National Red Cross (Red Crescent, Red Lion and Sun) Societies.

If the Parties to the conflict deem it necessary to restrict family correspondence, such restrictions shall be confined to the compulsory use of standard forms containing twenty-five freely chosen words, and to the limitation of the number of these forms dispatched to one each month.

PART III

STATUS AND TREATMENT OF PROTECTED PERSONS

SECTION I

PROVISIONS COMMON TO THE TERRITORIES OF THE PARTIES
TO THE CONFLICT AND TO OCCUPIED TERRITORIES

Article 27

Protected persons are entitled, in all circumstances, to respect for their persons, their honour, their family rights, their religious convictions and practices, and their manners and customs. They shall at all times be humanely treated, and shall be protected especially against all acts of violence or threats thereof and against insults and public curiosity.

Women shall be especially protected against any attack on their honour, in particular against rape, enforced prostitution, or any form of indecent assault.

Without prejudice to the provisions relating to their state of health, age and sex, all protected persons shall be treated with the same consideration by the Party to the conflict in whose power they are, without any adverse distinction based, in particular, on race, religion or political opinion.

However, the Parties to the conflict may take such measures of control and security in regard to protected persons as may be necessary as a result of the war.

Article 28

The presence of a protected person may not be used to render certain points or areas immune from military operations.

Article 29

The Party to the conflict in whose hands protected persons may be is responsible for the treatment accorded to them by its agents, irrespective of any individual responsibility which may be incurred.

Article 30

Protected persons shall have every facility for making application to the Protecting Powers, the International Committee of the Red Cross, the National Red Cross (Red Crescent, Red Lion and Sun) Society of the country where they may be, as well as to any organization that might assist them.

These several organizations shall be granted all facilities for that purpose by the authorities, within the bounds set by military or security considerations.

Apart from the visits of the delegates of the Protecting Powers and of the International Committee of the Red Cross, provided for by Article 143, the Detaining or Occupying Powers shall facilitate as much as possible visits to protected persons by the representatives of other organizations whose object is to give spiritual aid or material relief to such persons.

Article 31

No physical or moral coercion shall be exercised against protected persons, in particular to obtain information from them or from third parties.

Article 32

The High Contracting Parties specifically agree that each of them is prohibited from taking any measure of such a character as to cause the physical suffering or extermination of protected persons in their hands. This prohibition applies not only to murder, torture, corporal punishment, mutilation and medical or scientific experiments not necessitated by the medical treatment of a protected person but also to any other measures of brutality whether applied by civilian or military agents.

Article 33

No protected person may be punished for an offence he or she has not personally committed. Collective penalties and likewise all measures of intimidation or of terrorism are prohibited.

Pillage is prohibited.

Reprisals against protected persons and their property are prohibited.

Article 34

The taking of hostages is prohibited.

SECTION II

ALIENS IN THE TERRORITY OF A PARTY TO THE CONFLICT

Article 41

Should the Power in whose hands protected persons may be consider the measures of control mentioned in the present Convention to be inadequate, it may not have recourse to any other measure of control more severe than that of assigned residence or internment, in accordance with the provisions of Articles 42 and 43.

In applying the provisions of Article 39, second paragraph, to the cases of persons required to leave their usual places of residences by virtue of a decision placing them in assigned residence elsewhere, the Detaining Power shall be guided as closely as possible by the standards of welfare set forth in Part III, Section IV of this Convention.

Article 42

The internment or placing in assigned residence of protected persons may be ordered only if the security of the Detaining Power makes it absolutely necessary.

If any person, acting through the representatives of the Protecting Power, voluntarily demands internment, and if his situation renders this step necessary, he shall be interned by the Power in whose hands he may be.

Article 43

Any protected person who has been interned or placed in assigned residence shall be entitled to have such action reconsidered as soon as possible by an appropriate court or administrative board designated by the Detaining Power for that purpose. If the internment or placing in assigned residence is maintained, the court or administrative board shall periodically, and at least twice yearly, give consideration to his or her case, with a view to the favourable amendment of the initial decision, if circumstances permit.

Unless the protected persons concerned object, the Detaining Power shall, as rapidly as possible, give the Protecting Power the names of any protected persons who have been interned or subjected to assigned residence, or who have been released from internment or assigned residence. The decisions of the courts or boards mentioned in the first paragraph of the present Article shall also, subject to the same conditions, be notified as rapidly as possible to the Protecting Power.

Article 44

In applying the measures of control mentioned in the present Convention, the Detaining Power shall not treat as enemy aliens exclusively on the basis of their nationality de jure of an enemy State, refugees who do not, in fact, enjoy the protection of any government.

Appendix B

Source and Information Reliability Matrix

SOURCE RELIABILITY

B-1. Reliability ratings range from "Reliable" (A) to "Unreliable" (E) as shown in Table B-1. In every instance the rating is based on previous reporting from that source. If there has been no previous reporting, the source must be rated as "F". [NOTE: An "F" rating does not necessarily mean that the source cannot be trusted, but that there is no reporting history and therefore no basis for making a determination.]

Table B-1. Evaluation of Source Reliability.

A	**Reliable**	**No doubt** of authenticity, trustworthiness, or competency; has a history of complete reliability
B	**Usually Reliable**	**Minor doubt** about authenticity, trustworthiness, or competency; has a history of valid information most of the time
C	**Fairly Reliable**	**Doubt** of authenticity, trustworthiness, or competency but has provided valid information in the past
D	**Not Usually Reliable**	**Significant doubt** about authenticity, trustworthiness, or competency but has provided valid information in the past
E	**Unreliable**	**Lacking** in authenticity, trustworthiness, and competency; history of invalid information
F	**Cannot Be Judged**	**No basis** exists for evaluating the reliability of the source

INFORMATION CONTENT

B-2. The highest degree of confidence in reported information is given to that which has been confirmed by outside sources, "1". Table B-2 shows evaluation of information content. The degree of confidence decreases if the information is not confirmed, and/or does not seem to make sense. The lowest evaluated rating of "5" means that the information is considered to be false. [NOTE: A rating of "6" does not necessarily mean false information, but is generally used to indicate that no determination can be made since the information is completely new.]

Table B-2. Evaluation of Information Content.

1	**Confirmed**	**Confirmed** by other independent sources; **logical** in itself; **Consistent** with other information on the subject
2	**Probably True**	Not confirmed; **logical** in itself; **consistent** with other information on the subject
3	**Possibly True**	Not confirmed; **reasonably logical** in itself; **agrees with some** other information on the subject
4	**Doubtfully True**	Not confirmed; possible but **not logical**; **no other information** on the subject
5	**Improbable**	Not confirmed; **not logical** in itself; **contradicted** by other information on the subject
6	**Cannot Be Judged**	**No basis** exists for evaluating the validity of the information

Appendix C

Pre-Deployment Planning

HUMINT leaders must anticipate, identify, consider, and evaluate all potential threats. They must take advantage of enhanced information flow through hierarchical and nonhierarchical networks (computer, communications, and personnel). HCTs should—

- Review available databases on assigned contingency AOIs; review existing IPB products, conduct IPB on these AOIs; and develop appropriate IPB products. Information on databases created for specific contingencies can be gotten from the J2X.
- Continually monitor and update their OPLANs to reflect the evolving situation.
- Be aware of higher headquarters SOPs and DIA manuals for specific ISR management guidance.
- Prepare and practice an intelligence "surge" on likely contingency crises.
- Prepare and practice coordination from pre-deployment through redeployment with personnel from HUMINT, IMINT, MASINT, SIGINT, CA, PSYOP, SOF units, MP, and Engineers.
- Plan for requirements to support 24-hour operations: automation, communications capacity, and personnel necessary to provide continuous intelligence information collection and RM, processing, and reporting.
- Plan and coordinate for linguistic support.
- Forward all RFIs to higher headquarters in accordance with SOPs.
- Prepare and practice coordination with units they will support during pre-deployment exercises. Liaison must be conducted with commanders, S2s, administrative support personnel, logistical support personnel, communications personnel, and others. Obtain supported unit's briefing slide formats.
- Obtain copies of the supported unit's SOPs and ensure all team members are aware of the procedures governing HUMINT interface.
- Ensure that team data processing equipment is compatible with the supported unit's network structure and that appropriate interfaces are available.
- Exercise unit deployment SOPs, load plans, and packing lists.

Appendix D

S2 Guide for Handling Detainees, Captured Enemy Documents, and Captured Enemy Equipment

D-1. Detainees, retained personnel, CEDs, and CEE are critical sources of combat intelligence. Often the Maneuver Battalion S2 is the first MI officer to encounter these sources. His actions are critical to the exploitation system. Information from these items is time sensitive, and these information sources need to be exploited at as low an echelon as possible. The S2 should anticipate requirements for support based on planned missions and request HUMINT collector support as necessary. If unable to receive HUMINT collector support, the S2 must be prepared to exploit these sources of information to the best of his ability and more importantly expedite their evacuation to locations and units where they can be exploited.

PURPOSE

D-2. This guide is for battalion and brigade S2s. It explains standard procedures on what the S2 should do when his unit—

- Captures an enemy soldier or other detainee.
- Encounters a civilian on the battlefield.
- Finds or captures an enemy document.
- Discovers an unusual enemy weapon or other unusual piece of equipment during tactical operations.

PERSONNEL HANDLING

D-3. The GPW defines persons entitled to treatment as prisoners of war upon capture, in Article 4 (see Appendix A, Section I).

D-4. The GC defines the civilian population (exclusive of those civilian persons listed in GPW, Article 4) who benefit to varying degrees from the provisions of the Geneva Conventions. (See Appendix A, Sections II and III.)

D-5. Persons in each of these categories have distinct rights, duties, and restrictions. Persons who are not members of the Armed Forces, as defined in Article 4, GPW, who bear arms or engage in other conduct hostile to the enemy thereby deprive themselves of many of the privileges attaching to the members of the civilian population. The capturing unit treats all combatants and noncombatants who are suspected of being part of the threat force as EPWs or retained personnel until their status can be determined. This determination normally occurs at the detainee collection point or at a higher echelon. Noncombatants are handled, questioned, detained, evacuated, and released in accordance with theater policy. In all cases, detainees are treated humanely.

D-6. Detainees are treated humanely but with firmness at all times. High standards of discipline are required not only of detainees but also of capturing and escort forces. Fraternization with detainees or mistreatment or abuse of them is not only a violation but also is not conducive to good discipline. In addition to not being conducive to good discipline, the mistreatment or abuse of detainees is a violation of the UCMJ for which violators may be punished. The control of detainees is exercised through the issuance and firm enforcement of necessary instructions in their own language. Instructions relating to their control during evacuation from the combat zone should be as brief as possible. Care must be taken to ensure that detainees have a clear understanding of all instructions to them.

D-7. At the capture point, the capturing element performs the following steps on detainees. The senior soldier will ensure that the steps are performed. The steps are referred to as the "Five S's and a T".

STEP 1. SEARCH

D-8. The capturing unit's first job is to disarm, search, and maintain positive control over all detainees. The detainees are disarmed and searched for concealed weapons and for equipment and documents of particular intelligence value immediately upon capture, unless the number of detainees captured, enemy action, or other circumstances make such a search impracticable. Until each detainee is searched, the responsible forces must be alert to prevent the use of concealed weapons or destruction of documents or equipment.

D-9. The capturing unit gathers all loose CEDs and CEE in the area. Identification documents and protective military equipment such as helmets or NBC gear stay with the detainee unless otherwise directed by the battalion S2.

- Equipment. Items of personal or individual equipment that are new or appear to be of a type not previously observed may be of intelligence value and should be processed and reported in accordance with the unit's SOP, specific evacuation instructions in Annex B (Intelligence) of the OPORD, and theater policy. Equipment for personal protection such as protective masks or protective clothing may not be taken unless replaced with equivalent equipment.
- Documents. A CED is any piece of recorded information that has been in the hands of the enemy. CEDs include but are not limited to maps, sketches, photographs, orders, tactical and technical manuals and instructions, code books, log books, maintenance records, shipping and packing slips and lists, war and field diaries, personal diaries, pay books, newspapers, service records, postal savings books, payrolls, postcards and letters, and any written, printed, engraved, or photographic matter that may contain information relative to the enemy and to weather and terrain data. A capturing unit is normally not able to accurately determine the potential intelligence value of any documents found on the detainee. It is therefore normally expedient to remove all documents, with the exception of the detainee's primary identification document. These documents are sealed in a waterproof

container and tagged with part C of the capture tag. If capture tags are not available, the document bag must be marked at a minimum to identify the detainee to whom the documents belong (see Appendix I).

- Personal effects. Except as provided in Step 1, detainees should be permitted to retain all of their personal effects including money; valuables; protective equipment, such as helmets, protective masks, and like items; effects and articles used for clothing or eating, except knives and forks; identification cards or tags; badges of grade and nationality; and articles having a personal or sentimental value. When items of equipment issued for the personal protection of detainees are taken from them, they must be replaced with equivalent items serving the same purpose. Although money and other valuables may be taken from detainees as a security measure, they must then be receipted for and a record thereof maintained in a special register. These administrative steps normally are not practical to accomplish prior to arrival of the detainee at an EPW camp.

STEP 2. SILENCE

D-10. Detainees are kept silent so that they cannot plan deception or encourage each other to resist. Keeping the detainees silent also prevents them from relieving the stress and shock of capture by talking with others. If the shock of capture is preserved, HUMINT collectors can take advantage of it in an approach. The capturing unit instructs or signals the detainees to be silent. If that does not work, the detainee is gagged. Guards give orders to detainees, but do not converse with them or give them any comfort items.

STEP 3. SAFEGUARD

D-11. All detainees are promptly evacuated out of the "danger" zone. Their presence may not be used to render points or areas immune to attack, nor should they be retained for participation in psychological warfare or other activities. The capturing forces must protect detainees from reprisals. Detainees will not be denied food, potable water, or appropriate clothing and shelter. Necessary medical attention will not be delayed. Those detainees held in an area should be provided protective facilities and equipment and should be oriented as to procedures to be followed in case of chemical, biological, and radiological agent attack.

STEP 4. SEGREGATE

D-12. The capturing unit separates officers from enlisted, senior from junior, male from female, and civilian from military within their capabilities to both guard and safeguard the detainees. (Physical segregation at this point is not always possible.) Deserters and people of different nationalities and ideologies should be further segregated. The capturing unit prepares a capture tag and puts one on each detainee (see Figure D-1). Tagging procedures are discussed in paragraph D-16.

STEP 5. SPEED TO THE REAR

D-13. The capturing unit moves detainees and CEDs to the unit supply point or other area where transportation to the rear is available for evacuation. Evacuation of detainees from the combat zone should be effected within the minimum time after capture. While in the combat zone, not only may detainees become casualties as the result of enemy fire but also the fluidity of operations, the wide dispersion of units, and the austerity of facilities may necessitate their rapid evacuation.

D-14. The normal evacuation channel is from the detainee collection point through intermediate detainee holding areas to an internment facility at a higher echelon. Available returning transportation, however, may bypass any intermediate detainee holding area and proceed directly to a corps or theater internment facility. Detainees will then be processed directly into the corps or theater internment facility. Evacuation may be by foot, vehicle, rail, aircraft, or ship. Evacuate detainees who are litter patients through medical channels.

D-15. The command (brigade and above) from which the detainees are being evacuated is responsible to provide transportation and rations and for coordinating all other matters related to the evacuation. Escort guards are furnished by the command (division and above) to which the detainees are being evacuated.

STEP 6. TAG

D-16. When the detainees have been searched and segregated, the capturing unit prepares a capture tag and puts one on each detainee. It is very important that the capturing unit fill out the Capture Tag as accurately and completely as possible. HUMINT collectors will use the information from the tag when preparing to interrogate detainees. The "capturing unit" and "location of capture" information will be used to provide direct feedback to the capturing unit when information of immediate tactical value is obtained. Each EPW tag has a different serial number used for the purpose of accountability and cannot be reproduced. The EPW tag is perforated into three parts: Part A is attached to the detainee, Part B is retained by the capturing unit, and Part C is attached to the detainee's property (see Figure D-1).

DOCUMENT HANDLING

DOCUMENTS FOUND ON ENEMY PRISONER OF WAR

D-17. The battalion S2 and subordinate unit commander ensure that CEDs found on detainees are handled as follows. The capturing unit will—

- Search each detainee.
- Return identification documents to detainees. It may be preferable to return only one identity document, to preclude the detainee from spreading extras around to cause confusion. The preferred ID document to return to the detainee is a picture ID (such as a military

or government ID card). If the detainee has several identification documents, the S2 returns the ID that most accurately reflects the detainee's official status. This might be a military ID for a soldier and a passport or government-issue ID for a civilian. If the detainee has several identification documents with different names, this may be an indicator of CI interest. The S2 notifies the nearest CI unit.

- Write the following on the top and bottom half of the EPW capture tag: Number of documents taken, date and time, location and circumstances of capture, capturing unit's designation.
- Put CEDs in a waterproof bag, one per detainee.
- Affix Part C of the capture tag to the bag.
- Give CEDs to the senior escort.
- Direct the senior escort to evacuate CEDs with the detainee.

DOCUMENTS FOUND IN THE AO

D-18. An example of CEDs found in the AO is paperwork discovered in an overrun CP, but not on a detainee. The capturing unit will—

- Put CEDs in a waterproof bag.
- Follow the same procedures described above, and tag the bag.
- Evacuate the CEDs to the battalion S2.
- Evacuate all CEDs as dictated by Annex B of the OPORD. This is normally through the MI chain (for example, from Battalion S2 to Brigade S2, to the first HUMINT collection or DOCEX unit in the MI chain). The S2 normally coordinates with the S4 for the use of supply vehicles returning empty to the rear for the transportation of large numbers of documents.

INITIAL DOCUMENT EXPLOITATION

D-19. A combat unit without language-qualified personnel can perform limited battlefield DOCEX, mainly on maps and overlays. The unit S2 is normally responsible for any initial exploitation by the capturing unit. The S2 safeguards the items pending disposition. At the same time he—

- Looks over the document.
- Does not mark or harm it in anyway.
- Uses whatever resources are available to decipher it; for example, dictionaries and enemy map symbol guides.
- Looks for information that has a direct bearing on his current mission.

D-20. The S2 extracts the combat information and uses the SALUTE format as a template to organize the information.

EQUIPMENT HANDLING PROCEDURES

D-21. CEE includes all types of foreign materiel found on a detainee or in the AO that may have military application. The capturing unit—

- Always permits the detainee to keep protective equipment and equipment for his personal well being unless this gear is replaced by equivalent items by the capturing unit. This equipment includes helmet, NBC gear, mess gear (excluding knife and fork).
- Disposes of equipment in accordance with unit SOPs and instructions in Annex B of the OPORD. Most routine equipment is normally destroyed in place. Unusual or new equipment or equipment identified as being of TECHINT interest is tagged with a CEE tag (Part C of DD Form 2745) and evacuated to the nearest TECHINT unit. Communications equipment is also tagged and evacuated to the nearest SIGINT unit.
- Identifies equipment that cannot be easily evacuated; its location is passed through intelligence channels to the nearest unit that will be involved in its exploitation.

FIELD-EXPEDIENT TAGGING PROCEDURES

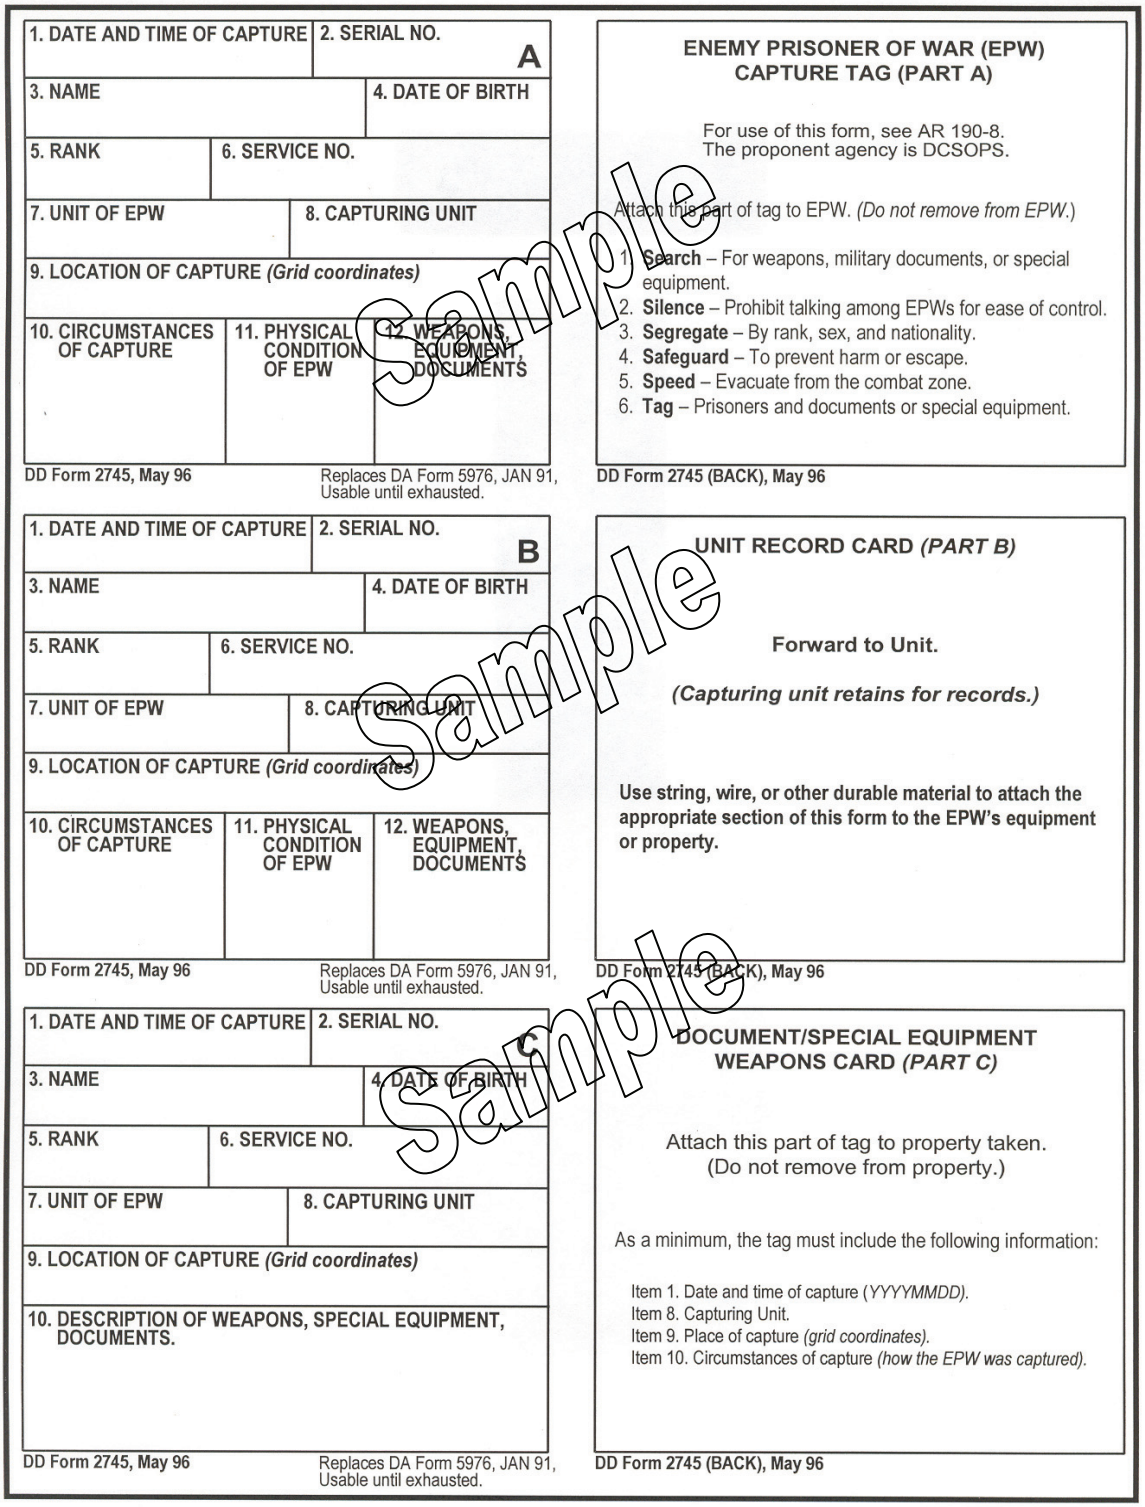
D-22. When no standard tag forms are available, the following field-expedient methods may be used:

- Use meals, ready-to-eat (MRE) cardboard or other type of paper.
- Write the capturing unit's designation.
- Write data and time of capture.
- Write POC coordinates.
- Write circumstances of capture.
- Identify EPW, captured document, or equipment captured.
- Put tag, without damaging the CED, in a waterproof bag.
- Attach EPW and CEE tags so they will not come off.

MEDICAL CARE

D-23. Medical equipment and supplies to permit the administering of emergency first aid should be available at each EPW collecting point and EPW holding area. A qualified medical retained person, if available, may administer first aid to other detainees. All detainees suspected of having communicable diseases are isolated for examination by a medical officer. Wounded detainees may be questioned by intelligence personnel once the detainees are cleared by competent medical authority for questioning.

D-24. For evacuation purposes, detainees may be classified as walking wounded or sick, or as non-walking wounded or sick. Walking wounded detainees are evacuated through MP EPW evacuation channels. Non-walking wounded are delivered to the nearest medical aid station and evacuated through medical channels.



1. DATE AND TIME OF CAPTURE | 2. SERIAL NO. A
3. NAME | 4. DATE OF BIRTH
5. RANK | 6. SERVICE NO.
7. UNIT OF EPW | 8. CAPTURING UNIT
9. LOCATION OF CAPTURE *(Grid coordinates)*
10. CIRCUMSTANCES OF CAPTURE | 11. PHYSICAL CONDITION OF EPW | 12. WEAPONS, EQUIPMENT, DOCUMENTS

DD Form 2745, May 96 — Replaces DA Form 5976, JAN 91, Usable until exhausted.

ENEMY PRISONER OF WAR (EPW) CAPTURE TAG (PART A)

For use of this form, see AR 190-8.
The proponent agency is DCSOPS.

Attach this part of tag to EPW. *(Do not remove from EPW.)*

1. **Search** – For weapons, military documents, or special equipment.
2. **Silence** – Prohibit talking among EPWs for ease of control.
3. **Segregate** – By rank, sex, and nationality.
4. **Safeguard** – To prevent harm or escape.
5. **Speed** – Evacuate from the combat zone.
6. **Tag** – Prisoners and documents or special equipment.

DD Form 2745 (BACK), May 96

1. DATE AND TIME OF CAPTURE | 2. SERIAL NO. B
3. NAME | 4. DATE OF BIRTH
5. RANK | 6. SERVICE NO.
7. UNIT OF EPW | 8. CAPTURING UNIT
9. LOCATION OF CAPTURE *(Grid coordinates)*
10. CIRCUMSTANCES OF CAPTURE | 11. PHYSICAL CONDITION OF EPW | 12. WEAPONS, EQUIPMENT, DOCUMENTS

DD Form 2745, May 96 — Replaces DA Form 5976, JAN 91, Usable until exhausted.

UNIT RECORD CARD *(PART B)*

Forward to Unit.

(Capturing unit retains for records.)

Use string, wire, or other durable material to attach the appropriate section of this form to the EPW's equipment or property.

DD Form 2745 (BACK), May 96

1. DATE AND TIME OF CAPTURE | 2. SERIAL NO. C
3. NAME | 4. DATE OF BIRTH
5. RANK | 6. SERVICE NO.
7. UNIT OF EPW | 8. CAPTURING UNIT
9. LOCATION OF CAPTURE *(Grid coordinates)*
10. DESCRIPTION OF WEAPONS, SPECIAL EQUIPMENT, DOCUMENTS.

DD Form 2745, May 96 — Replaces DA Form 5976, JAN 91, Usable until exhausted.

DOCUMENT/SPECIAL EQUIPMENT WEAPONS CARD *(PART C)*

Attach this part of tag to property taken.
(Do not remove from property.)

As a minimum, the tag must include the following information:

Item 1. Date and time of capture (*YYYYMMDD*).
Item 8. Capturing Unit.
Item 9. Place of capture *(grid coordinates)*.
Item 10. Circumstances of capture *(how the EPW was captured)*.

Appendix E

Extracts from Allied Joint Publication (AJP)-2.5

Following are excerpts from Allied Joint Publication-2.5, Handling of Captured Personnel, Equipment and Documents. AJP-2.5 is primarily an amalgamation of procedures outlined in STANAG 2033, STANAG 2044, and STANAG 2084, and will be used as the authoritative source for matters governed by those STANAGs. S2s and HUMINT collectors should maintain a copy on hand.

THE GENEVA CONVENTIONS

E-1. Treatment of prisoners of war (PWs) and other detainees as well as the handling of personal possessions including personal documents belonging to them will at all times be in accordance with the 1949 Geneva Conventions and, if ratified by the nations concerned, with the 1977 Protocols.

THE DETAINING POWER

E-2. The responsibilities of the "Detaining Power" as set out in GC3 shall rest with the nation or the deployed NATO command which initiated the capture or detention of the person or persons in question.

E-3. Transfers of PWs between NATO nations must be in accordance with GC3, Article 12, as interpreted but not superseded by national agreements.

KNOWLEDGE OF THE GENEVA CONVENTIONS AND THE 1977 PROTOCOLS

E-4. The Geneva Conventions require the signatories in time of both peace and war to circulate the text of the Conventions as widely as possible within their countries. They are especially required to ensure that the provisions and implications of the Conventions are clearly understood by the members of their armed forces and by the civilians attached to them. In order to assist this process, it is suggested in the Conventions that instruction in them is included in the syllabus of appropriate military and civilian courses of instruction.

E-5. The conventions also state that any military or other authority assuming responsibility for dealing with PWs in time of war or armed conflict must be in possession of the text of the Conventions and that its personnel must be instructed in how the Conventions affect them in the execution of their duties with PWs.

E-6. If ratified by the nations concerned, these requirements are, by inference, also applicable to the 1977 Protocols.

PRISONER-OF-WAR STATUS

E-7. Captured personnel (CPERS) can be divided into two categories: Captured personnel who are PWs and other detainees.

E-8. Prisoner-of-war status is conferred on captured personnel who fall within the categories listed in Article 4 of GC3, which is reproduced in Annex A, or, if ratified by the nations concerned, those who meet the expanded definition of a PW as stated in Protocol I of the 1977 Protocols.

E-9. Other detainees are personnel being held by NATO forces until their status can be determined and their further disposition can be decided.

E-10. Furthermore, when NATO forces are engaged in Peacetime Support Operations (PSOs), the operational plan should contain specific instructions as to which individuals will have PW status. Directions for handling other detainees, including those suspected of crimes against humanity and war crimes, are also to be included in the operational plan or in the Standing Operating Procedures used in the operation.

PERSONNEL

E-11. Conditions allowing, the following procedures should be followed by the capturing unit:

a. CPERS should be disarmed immediately, and all documents and effects of military or investigative interest except for necessary clothing, identity documents and protective equipment (Geneva Convention Relative to the Treatment of Prisoners of War (GC3), Article 18) should be removed. CPERS should then be tagged in accordance with the procedures outlined at Annex B. A Common Capture Report should also be completed and forwarded in accordance with the procedure set out in Annex C. It is important that the documents, equipment, maps, etc., taken from a CPERS accompany him to the next receiving unit. Valuable information may be lost by not having these items available during processing and interrogation.

b. Within the confines of the tactical situation, CPERS are to be segregated according to rank, grade, service, sex and nationality or ethnic group/warring faction to minimize the opportunity to prepare counter-interrogation measures. Furthermore, deserters, civilians and political indoctrination personnel will be individually segregated from other CPERS. Such segregation shall be undertaken in a manner which does not violate GC3, Article 16.

c. Talking or fraternization between CPERS is to be prevented in order not to prejudice future intelligence collection operations. CPERS will be allowed no opportunity to exchange information between themselves, to exchange identities or to dispose of articles of intelligence interest.

d. Interrogation operations must not be compromised by contact between CPERS and personnel not concerned with interrogation duties.

e. CPERS will also be prevented from observing sensitive and critical activities, equipment and procedures involving NATO, national or allied forces.

f. CPERS are to be guarded in a manner which shall deny them the opportunity for escape or sabotage.

g. Defectors and political refugees should also be segregated from other CPERS wherever possible. These personnel shall be screened by the nearest Interrogation Unit (IU), which will decide on their value to the intelligence organization and consequent future movements. In all cases, defectors are to be treated in accordance with the Geneva Convention Relative to the Protection of Civilians in Time of War (GC4). National policy may provide defectors treatment in accordance with GC3 where such treatment provides greater protection than GC4.

h. Personnel claiming to be agents of an allied power shall also be segregated from other CPERS. The intelligence organization (G2 or CJ2) is to be informed of all such individuals as soon as possible and will arrange for their screening to determine their future disposition.

i. CPERS suspected of crimes against humanity and war crimes will also be segregated from other prisoners. Legal authorities and the intelligence organization are to be informed of such suspects as soon as possible. They will be taken into custody by law enforcement personnel. Intelligence exploitation should be undertaken in cooperation with the legal authorities.

j. All CPERS are to be treated humanely.

k. Naval and Air Force personnel are to be identified and the intelligence organization is to be notified in order that interrogation by naval/air force personnel may take place at the earliest opportunity.

l. CPERS are to be escorted to the nearest Collecting Point or Holding Area as quickly as possible.

m. Should any doubt arise as to whether any persons, including those appearing to be PWs, having committed a belligerent act and having fallen into Allied hands, belong to any of the categories of persons entitled to PW status pursuant to Article 4 of GC3, such persons shall enjoy the protection of GC3 until such time as their status has been determined by a competent tribunal. If such a tribunal determines that an individual does not qualify for PW status, then the detaining commander must determine whether the detainee qualifies as a ”protected person” pursuant to GC4, and obtain legal advice relative to the proper course of action for dealing with such detainees.

DOCUMENTS

E-12. Captured documents (CDOC) considered of intelligence interest will be handled by the capturing unit in the following manner:

a. The capturing unit will conduct a preliminary screening to obtain information of immediate technical or tactical value.

b. An intelligence report (INTREP) identifying the CDOC and its disposition as well as giving information considered to be of immediate tactical value will be prepared and submitted by the capturing unit. (See STANAG 2022.)

c. The capturing unit will tag or otherwise mark the CDOC as follows:

- National identifying letters of capturing unit as prescribed in STANAG 1059.
- Designation of capturing unit including service.
- Serial number of the CDOC. This will consist of a number allocated sequentially by the capturing unit.
- DTG of capture.
- Location of capture (geographic coordinates or UTM grid reference including grid zone designation and 100,000-meter square identification).
- Captured from Unit (enemy or warring faction) (including national identifying letters in accordance with STANAG 1059).
- Summary of circumstances under which the CDOC was obtained. Interrogation serial number of any associated CPERS, if appropriate or known.
- CED associated with a captured person should be marked with part C of the Standardized EPW Capture and Personal Equipment Tag.

d. CED to be used as evidence in legal proceedings against CPERS suspected of crimes against humanity and war crimes will be kept under guard or in a secure area separate from other CED.

EQUIPMENT

E-13. Captured Equipment (CE) and Associated Technical Documents (ATDs) considered of intelligence interest will be handled by the capturing unit in the following manner:

a. A Capture Report as set out in Annex C of the OPORD will be prepared by the capturing unit upon the discovery or capture of CE or ATD believed to be of intelligence interest. The reporting channels are from the capturing unit through the chain of command to the first TECHINT element.

b. The capturing unit will conduct a preliminary screening to obtain information of immediate technical or tactical value. A Preliminary Technical Report (PRETECHREP) as set out in Annex D of the OPORD will be prepared and submitted through established intelligence channels.

c. Intelligence Reports (INTREP) may, as circumstances dictate, be submitted in advance but not in lieu of the Capture Report and PRETECHREP. (See STANAG 2022.)

d. CE and ATD will be tagged or marked by the capturing unit as follows:

- National identifying letters of capturing unit as prescribed in STANAG 1059.
- Designation of capturing unit including service.
- DTG of capture.
- Location of capture (geographic coordinates or UTM grid reference including grid zone designation and 100,000-meter square identification).

- Captured from Unit (enemy or warring faction) (including national identifying letters in accordance with STANAG 1059).
- Summary of circumstances of capture.
- Associated CPERS.

e. CE and ATD to be used as evidence in legal proceedings against CPERS suspected of crimes against humanity and war crimes will be kept under guard separate from other CE and ATD.

This page intentionally left blank.

Appendix F

NATO System of Allocating Interrogation Serial Numbers

1. Every captured person selected for interrogation will be given an Interrogation Serial Number. This number shall be allocated by the Interrogation Unit conducting the **first** interrogation of the captured person.

2. The number should not be confused with the Prisoner of War Internment Serial Number (ISN), which is to be used for administrative purposes only.

3. The purpose of the Interrogation Serial Number is to identify the source of information to ensure its proper evaluation, processing, and follow-up action. It will also identify the nationality and location of the interrogation unit.

4. The number shall be constituted as follows:

a. 2 letters to indicate the Nationality of the captured person (see para 6).

b. 2 letters to indicate the Service of the captured person (see para 7).

c. 1 letter to indicate the Arm of Service of the captured person (see para 8).

d. 4 numbers to indicate the Interrogation Sequence Number of the captured person (see para 9).

e. 4 numbers to indicate the Day and Month of Capture.

f. A dash (-) to show a sequence break.

g. 4 letters to indicate the Nationality and Service of the Interrogation Unit (see para 10).

h. 4 letters to indicate the Interrogation Unit.

5. Each group shall be separated by a dash. The final number shall therefore appear as in the following examples:

LS – NV – B – 0012 – 2105 – USNV – 0159

Liechtenstein – Naval prisoner – Seaman – 12th captured person interrogated - captured 21 May – interrogated by US Navy – team 159

AN – AF – H – 0357 – 0211 – GEAF – 0007

Andorra – Air force prisoner – Intelligence – 357th captured person interrogated – captured 2 Nov – interrogated by GE Air Force – team 7

SM – AR – X – 0431 – 0707 – UKAR – 0019

San Marino – Army prisoner – One star or above – 431st captured person interrogated – captured 7 Jul – interrogated by UK Army – team 19

6. The two letters used for indicating the Nationality of the captured person will be in accordance with established NATO Country codes in STANAG 1059.

7. The following list of letters is to be used to indicate the Service of the captured person:

AR	- Army	NI	- Naval Infantry
NV	- Navy	AB	- Airborne Forces
NA	- Naval Air Arm	SF	- Special Purpose Forces
AF	- Air Force	PL	- Police
IR	- Irregular	CV	- Civilian (other than Police)

8. The following list of letters is to be used to indicate the Arm of Service of the captured person:

Navy (A)	**Army (B)**	**Air Force (C)**	**Other/Partisan Forces (D)**
A. Aircrew	Aircrew	Aircrew	Aircrew
B. Seamen	Infantry	Ground Crew	Merchant Marine
C. Communications	Signals	Communications	Radio Officers/Operators
D. Weapons/ Electronic Engineer	Electrical/Electronic Engineer	Electrical/Electronic Engineer	
E. Mechanical/ Marine/Engineers	Engineers	Mechanical/Air Frame/Engineers	
F. Gunnery	Artillery	Ordnance	Weapons/Ordnance Explosives
G. *HQ Staff	*HQ Staff	*HQ Staff	*HQ Staff
H. Intelligence	Intelligence	Intelligence	Intelligence
I. Marines	Airborne Forces	Airfield Defense	
J. Cooks/Stewards	Catering	Catering	Catering
K. Legal/Political	Legal/Political	Legal/Political	Legal/Political
L. Medical/Dental/ Nursing	Medical/Dental/ Nursing	Medical/Dental/ Nursing	Medical/Dental/ Nursing
M. Electronic Warfare	Electronic Warfare	Electronic Warfare	Electronic Warfare
N. Operations	Operations	Operations	Operations
O. Police	Police	Police	Police
P. Supply	Quartermaster	Supply	Supply
Q. Strategic Weapons	Strategic Weapons	Strategic Weapons	Strategic Weapons
R. Special Purpose Forces	Special Purpose Forces	Special Purpose Forces	Special Purpose Forces
S. Air Traffic Control	Armored	Air Traffic Control	Air Traffic Control
T. *Unknown	*Unknown	*Unknown	*Unknown

Navy (A)	Army (B)	Air Force (C)	Other/Partisan Forces (D)
U. Instructors	Education	Education	Instructors
V. Ministers of Religion	Ministers of Religion	Ministers of Religion	Ministers of Religion
W. *Submarines	Artillery Spotters	Forward Air Controllers	Couriers, etc.
X. *One Star +	*One Star +	*One Star +	*Officers in Command of Irregular Forces
Y. *Other	*Other	*Other	*Other
*Notes: G – Headquarters staffs below one star rank T – Captured Person's arm of service not known to report writer W – To be used in respect of all submarines regardless of arm or specialization X – To be used in respect of all ONE STAR or above officers regardless of army Y – PW arm of service not included in the appropriate list			

9. The sequence number of the interrogated captured personnel shall be of four digits allocated in numerical order of interrogation by the team first interrogating the captured person.

10. Country, services and team codes.

a. Country codes, as laid down in STANAG 1059, are to be used for indication of the Nationality of the Interrogation Team.

b. The following lists of letters are to be used for indicating the Service of the Interrogation Team:

ARMY	- AR	AIR FORCE	- AF
NAVY	- NV	MARINE	- MR
COAST GUARD	- CG	PARA-MILITARY	- PM

c. NATO teams will use the following abbreviations: (These will be determined as command changes are implemented and STANAG 1059 is revised).

SC EUROPE	RC SOUTH
RC NORTH	JHQ SOUTHWEST
JHQ NORTH	JHQ SOUTH
JHQ NORTHEAST	JHQ SOUTH CENTER
JHQ CENTER	JHQ SOUTHEAST
CC AIR NORTH	CC AIR SOUTH
CC NAV NORTH	CC NAV SOUTH
SC ATLANTIC	RC EAST
RC WEST	STRIK FLTLANT
RC SOUTHEAST	SUB ACLANT

11. Nations will allocate 4-digit serial numbers to their interrogation teams. NATO Commands will issue similar numbers to subordinate national interrogation teams under their command.

This page intentionally left blank.

Appendix G

Questioning Quick Reference

This appendix offers a quick reference for the trained HUMINT collector. It is not meant to be all-inclusive, nor instructive in proper questioning technique, but lays out frequently used requirements grouped logically by OB factor. Proper formation of questions is covered in detail in Chapter 9.

Missions: Mission questioning consists of three areas: Time of Capture Mission, Future Mission, and Past Mission. Missions are questioned in that order, to ensure that the information is collected in the order of importance to a supported commander. Logical follow-up questioning may lead the collector into any of the OB factors at any time during questioning in order to provide complete information.

Offensive Missions:
When will the enemy attack?
Where will they attack?
What is the main objective of the attack?
What units will participate in the attack?
What tactics will be employed?
What artillery, air, and other units will support the attack?

Defensive Missions:
Where will the enemy establish lines of defense?
What units have been assigned to the defensive lines?
What obstacles have been emplaced (mines, trenches, wire, etc.)?
What artillery support is there for the defensive operation?

Retrograde Operations:
What units will take part in the retreat?
What are the current positions of the retreating units?
When will they start to retreat?
What routes will be used?
What is the planned destination of the retreating units?
What units will cover the retreat?

Composition:
What is the command and control element of (the target unit)?
What types of units are directly subordinate to (the target unit)?
What is the designation of (each of the subordinate units)?
How many units of that type are directly subordinate to (target unit)?
What units are attached? When? Why? What unit(s) are they detached from?
What units are detached? When? Why? What unit(s) are they attached to now?

Weapons and Equipment Strength:

Individual Weapons:
What individual weapons are there in (target unit)?
How many?
What is the distribution of the weapons?
Crew-Served Weapons: What crew-served weapons are in (target unit)?
How many?
What is the distribution of the weapons?
Other Weapons: What other weapons are there in (target unit)?
What types?
How many?
How are they distributed?
Vehicles: What armored vehicles are in (unit)?
How many?
What nomenclature?
What other vehicles are in (unit)?

Dispositions:

Disposition questioning is ideally done with the aid of a map.
Where is (the target disposition)?
Show (on the map) the location of (the target disposition).
What enemy units, activities, or equipment are at that location?
What security measures are being employed at that location?
Additionally, specific types of dispositions require additional follow-up:

Area-Type Dispositions: (Staging Areas, Assembly Areas, Trains, etc.)
Show on the map (or describe) the perimeter of the disposition.
Where are units or activities located within it?
Where are the approaches/entrance?
What unit is in charge?
What vehicles or equipment are located within the disposition?
What is the date of information?

Line-Type Dispositions: (Line of Departure, Artillery emplacement, etc.)
Show on the map (or describe) the location of the disposition.
Define and locate both ends of the disposition.
What equipment is located there?
In the case of artillery, describe the placement and orientation of the guns, ammunition, radar, and support vehicles.

Tactics:

Offensive: What offensive tactics are being employed by (unit)?
What other units are involved?
When did (unit) begin employing these tactics?
What are the major objectives?
Defensive: What defensive tactics are being employed by (unit)?
What other units are involved?
When did (unit) begin employing these tactics?
Special Operations: What special operations tactics are being employed by (unit)?
What are the designations of the units employing special operations tactics? When did (unit) begin employing special operations tactics?
Where/Why are these tactics being employed?

Training:

Individual Training: What individual training is being conducted by (unit)?
Who is being trained?
How effective is the training?
Where is the training conducted?
What are the training standards?
Unit Training: What unit training is being conducted by (unit)?
Who is being trained?
How effective is the training?
Where is the training conducted?
What are the training standards?
Specialized Training: What specialized training is being conducted by (unit)?
Who is being trained?
How effective is the training?
Where is the training conducted?
What are the training standards?
What specialized equipment is used in the conduct of the training?

Combat Effectiveness:

Losses:
Personnel: What personnel losses have been incurred by (unit)?
When? Where? How?
What were the duty positions/ranks of the lost personnel?
Equipment: What equipment losses have been sustained by (unit)?
What type of equipment was lost?
When? Where? How many?
How were they lost?

Replacements (Personnel):

Received: What replacements have been received by (unit)?
What replacements are available to (unit)?
How many?
From where were the replacements received?
Available: What personnel replacements are available to (unit)?
From where are replacements available?
How many? What ranks?
How long would it take for replacements to arrive once requested?

Replacements (Equipment):

Received: What equipment replacements have been received by (unit)?
How many?
From where were the replacements received?
How does the quality of the replacement equipment compare to that of the original equipment?
What is the level of confidence in the replacement equipment, compared to the original?
Available: What equipment replacements are available to (unit)?
From where are replacements available?
How long would it take to receive replacement equipment once requested?
How many of each type of equipment are available?

Reinforcements:

Received: What reinforcements have been received by (unit)?
What type was the reinforcing unit?
What is the designation of the reinforcing unit?
What equipment did the reinforcing unit bring?
To which unit was the reinforcing unit further assigned?
Why did (receiving unit) receive reinforcements?
How long will the reinforcing unit be assigned as reinforcement to (unit)?
Available: What reinforcements are available to (unit)?
From where (parent unit/location) are reinforcements available?
What types of units are available to reinforce (unit)?
How long would it take for reinforcements to arrive, once requested?

Morale:

Describe the morale of the members of (unit).
How long has the morale been…?
What is the unit leadership doing to (maintain/improve) the morale?
What effect has (high/low) morale had on the behavior or performance of the unit members?

Logistics:

Weapons: What is the condition of the (specific weapons) in (the unit)?
Why are (the weapons) in that condition?
What is being done to improve the condition of (the weapons)?
How often is maintenance performed? By whom?
Who inspects weapons? How often?
Is there an increased emphasis on maintenance? If so, why?
What is done to prevent/alleviate a shortage while weapons are being maintained?
What spare parts are there for weapons in (unit)?
What shortages of spare parts are there?
What problems are there with spare parts (quality, fit, delays, etc)?
Ammunition: What types of ammunition are available for the (weapon/weapon system) in the (unit)?
What problems are being experienced with ammunition for (weapon or weapon system) in (unit)? Why? Since when?
What is being done to correct the problem(s)?
What shortages of ammunition for (weapon or weapon system) are there in (unit)?
What is being done to correct the shortage?
When was the last issue of ammunition for the (weapon or weapon system) in the (unit)?
How much was issued?
When is the next issue of ammunition planned?
(For insurgents/irregulars - Where is funding obtained for ammunition/explosive purchases?
Where are ammunition/explosives obtained?
How are ammunition/explosives transported/delivered?
Vehicles: What is the condition of the (specific vehicle) in (the unit)?
Why are (the vehicles) in that condition?
What is being done to improve the condition of (the vehicles)?
How often is maintenance performed? By whom?
Who inspects vehicles? How often?

Is there an increased emphasis on maintenance? If so, why?
What is done to prevent/alleviate a shortage while vehicles are being maintained?
What spare parts are there for vehicles in (unit)?
What shortages of spare parts are there?
What problems are there with spare parts (quality, fit, delays, etc)?

POL:

What problems have been experienced with the petroleum, oils, and lubricants (POL) for the (vehicle type) in the (unit)?
Why are there problems?
Since when have there been problems?
What is being done to correct the problems?
What shortages of POL are there? Why?
What is being done to alleviate the shortages?
When was the last resupply of POL in (unit)? Where? How much?
When is the next resupply of POL planned?

Communications Equipment:

What is the condition of the (specific radio set) in (the unit)?
Why are (the radios) in that condition?
What is being done to improve the condition of (the radios)?
How often is maintenance performed? By whom?
Who inspects communication equipment? How often?
Is there an increased emphasis on maintenance? If so, why?
What is done to prevent/alleviate a shortage while radios are being maintained? What spare parts are there for communication equipment in (unit)?
What shortages of spare parts are there?
What problems are there with spare parts (quality, fit, delays, etc)?

Medical:

Equipment: What individual medical equipment is in (unit)? How many?
What is the distribution?
What are the contents of individual medical kits in the (unit)?
What is the quality?
What shortages are there?
What problems are there with the individual medical equipment/supplies in (unit)?
What vehicular medical equipment is in (unit)? How many?
What is the distribution?
What are the contents of vehicular medical kits in (unit)?
What is the quality?
What shortages are there?
What problems are there with the vehicular medical equipment/supplies in (unit)?

Personnel: What medical personnel are assigned to (unit)?
What medical personnel are available to treat members of (unit)? How many? What are the duty positions of the medical personnel?
What level of medical care are the medical personnel able to provide to members of (unit)?

Facilities: What medical facilities are available to members of (unit)?
Where are the medical facilities?
What level of care is available there?
What higher echelons of medical care are available?

Medical Evacuation (MEDEVAC) Procedures: What MEDEVAC procedures are available to members of (unit)?
Where are MEDEVAC collection points?
What different MEDEVAC procedures are used for more seriously wounded personnel, compared to lightly wounded?
Food: What rations are members of (unit) eating?
What shortages are there of food?
What is the quality?
What problems have been encountered with the rations provided to (unit)?
When was the last issue of rations to members of (unit)?
When is the next issue?
What reserve stocks of field rations are there in (unit)?
Water: What is the source of drinking water for members of (unit)?
What problems have been encountered with quality, shortages, or contamination of drinking water?
What water purification methods are available to members of (unit)?
Under what circumstances will they be used?
If water purification tablets are used, what color are they?

Electronic Technical Data:

Radio Frequencies: What are the primary and alternate frequencies for radios in (each unit)?
Under what circumstances will alternate frequencies be used?
What networks operate on the various frequencies?
Call Signs: What is the call sign of (unit)?
What is the call sign of (each) person of authority in the unit?
When do call signs change?
What informal call signs are in use?

Miscellaneous:

Personalities: Question for name, rank, unit, duty position, and unit of key leaders.
Collect identifying characteristics such as age, height, weight, build, hair and eye color, writing hand, facial hair and teeth.
Report contact information such as work and home addresses, telephone numbers, fax number, and email address.
Complete biographical IIR format is in DIAM 58-12 (S//NF).
Code Names: What is the code name of (each unit)?
What code names are being used for specific operations?
Passwords: What is the current challenge/password for (unit)?
When did it go into effect?
When will it change?
What will the next challenge/password be?
What other (informal, "run in") passwords are in use?

Obstacles:

Enemy: What obstacles have the enemy forces emplaced?
Where, when, what type of obstacles?
What safe lanes are there through or around the obstacles?
(If mine fields, collect type, pattern, quantity, and method of emplacement of mines.)
How are the obstacles being covered (artillery, ambush, etc.)?

Why have the obstacles been emplaced where they are (denial of terrain, canalization into a fire sack, etc.)?

Friendly: What friendly obstacles have enemy forces encountered? Where? When?

Have those obstacles been breached or otherwise neutralized?

What effect have the friendly obstacles had on enemy maneuver?

PSYOP:

Enemy: What PSYOP are being conducted by (unit)?

What is the text of the messages?

Who is the target audience?

Where are the PSYOP materials prepared?

Where and how are they delivered? What is the hoped-for effect?

Friendly: What PSYOP have members of (unit) encountered? Where? When?

What form of PSYOP was encountered?

What effect have the PSYOP had on the officers/NCOs/enlisted of (unit)?

What is the leadership of (unit) doing to counter the effects of friendly PSYOP?

This page intentionally left blank.

Appendix H

SALUTE Reporting

H-1. The SALUTE report format requires brief entries which require the collector to break information down into basic elements: who, what, where, when, why, and how. This allows for efficient reporting via electronic or hardcopy medium. It also allows the analyst to quickly scan multiple reports to find specific information.

H-2. Figure H-1 provides guidance and is not to be construed as strict requirements. SALUTE reports of combat activity may only contain a word or two in each entry, whereas Intelligence reports tend to include more detail.

TO: Usually the address of the supported S2/G2 (according to unit SOP)

FROM: Your unit or team designation, or your duty position, as appropriate

DTG: The date-time group of when the report is being submitted

Report Number: From local SOP

1. (S)ize/Who: Expressed as a quantity, and echelon, or size (e.g., 1 x BDE). If multiple echelons are involved in the activity being reported, there can be multiple entries (e.g.,1 x BDE; 2 x BN). Non-standard units are reported as such (e.g., bomb-making class; support staff).

2. (A)ctivity/What: This line is the focal point of the report and relates to the PIR or important non-PIR information being reported. It should be a concise bullet statement.

3. (L)ocation/Where: Generally a grid coordinate, including the 100,000 meter grid zone designator. The entry can also be an address, if appropriate, but still should include an 8-digit grid coordinate. City names will always be followed by the two-character country code. If the activity being reported involves movement (advance, withdrawal, etc.) the location entry will include "From" and "To" entries. The route used will be reported under "Equipment/How."

4. (U)nit/Who: This entry identifies who is performing the activity described in the "Activity/What" entry. Include the complete designation of a military unit, identification of a civilian or insurgent group, or the full name of an individual, as appropriate.

5. (T)ime/When: For a future event, this is when the activity will initiate. Past events are usually not the subject of SALUTE reports, but if a past event is to be reported, the Time/When entry will generally reflect when the event ended. Ongoing events are reported as such. Reports of composition of forces, morale, and Electronic Technical Data and other non-event topics are reported as ongoing. When reporting on a disposition, the "Time/When" entry is generally the last time the source was at the disposition.

6. (E)quipment/How: The information reported in this entry clarifies, completes, and/or expands upon information reported in any of the previous entries. It includes information concerning equipment involved, tactics used, and any essential elements of information not reported in the previous paragraphs.

7. Remarks: Use this entry to report the source of the information, whether a person, a CED, open-source media, or other source. Include the date of information and the PIR that the reported information addresses. Map data for coordinates given in the "Location/Where" entry are included, stating map series name, sheet number, scale and edition. If there are enclosures to the SALUTE report, such as sketches, they are annotated here.

Figure H-1. Example of a Written SALUTE Report.

Appendix I

Document Exploitation and Handling

I-1. DOCEX is a vital information source in the development of the all-source intelligence picture. Unless planned for and carefully monitored, the volume of CEDs in all operations can rapidly overwhelm a unit's capability to extract meaningful information.

DEFINITIONS

I-2. A document, as defined by AJP 2.5, is any piece of recorded information, regardless of form. Documents include printed material such as books, newspapers, pamphlets, OPORDs, and identity cards as well as handwritten materials such as letters, diaries, and notes. Documents also include electronically recorded media such as computer files, tape recordings, and video recordings and the electronic equipment which contains documents or other vitally important intelligence. Examples include hard drives, operating systems, and personal electronic devices, including phones, PDAs, and GPS devices. A CED may be needed by several collection or exploitation activities at the same time, requiring copies to be made. Collectors must have ready access to copying equipment. Documents often must be evacuated through two different channels for proper exploitation, which also makes copying necessary. Such documents and equipment require special handling to assure that they are returned to their owners.

I-3. DOCEX is the systematic extraction of information from threat documents for the purpose of producing intelligence or answering IRs. A threat document has been in the possession of the threat, written by the threat, or is directly related to a future threat situation. DOCEX can occur in conjunction with HUMINT collection activities or as a separate activity.

I-4. A CED is any document that was in the possession of an enemy force that subsequently comes into the hands of a friendly force, regardless of the origin of that document. There are three types of CEDs.

- Official - documents of government or military origin.
- Identity - personal items such as identification (ID) cards or books, passports, driver licenses.
- Personal - documents of a private nature such as diaries, letters, and photographs.

I-5. Open-source documents are documents that are available to the general public including but not limited to newspapers, books, videotapes, public records, and documents available on the Internet or other publicly available electronic media.

I-6. Source-associated documents are documents that are encountered on or in immediate association with a human source. These may include both official and personal documents. Documents associated with human sources are normally exploited, at least initially, during the interrogation or debriefing of the source. Interrogators typically use these documents during planning and preparation for interrogation of the associated EPW. These personal documents and source identification documents are therefore evacuated in conjunction with the associated source and sent through prisoner, detainee, or refugee evacuation channels rather than through intelligence channels. If the duplication capability exists, collectors should copy personal documents that contain intelligence information and evacuate the copy through intelligence channels. The original personal document should be evacuated with the detainee but not on his person until the HUMINT collector has exploited it. Collectors evacuate official documents through intelligence channels after initial exploitation. If possible, the collector will copy official documents and evacuate the copy with, but not on, the source.

OPEN-SOURCE INFORMATION

I-7. Open-source information is publicly available information appearing in print or electronic form. Open-source information may be transmitted via radio, television, newspapers, commercial databases, electronic mail networks, or other electronic media like CD-ROMs. Whatever form they take, open sources are not—

- Classified at their origin.
- Subject to proprietary constraints.
- The product of sensitive contacts with US or foreign persons.

I-8. In all operations, open-source collection can be a valuable addition to the overall intelligence collection and each intelligence discipline's efforts. Open-source information supplements the HUMINT collection effort, and all types of open sources must be considered for exploitation.

I-9. Open sources are evaluated and categorized as friendly, neutral, or hostile. Certain high-value, open-source information sources may be identified for continuous monitoring. Other open-source information sources may be identified to screen for the presence or lack of specific indicators. In addition, the information obtained from open sources is extremely helpful for the HCT members to be current with the latest developments in the AO, which enables them to establish rapport and effectively converse with their sources. Open-source documents are exploited in the same manner as CEDs.

OPEN-SOURCE DOCUMENT OPERATIONS

I-10. Open-source document operations are the systematic extraction of information from publicly available documents in response to command IRs. Open-source document operations can be separate operations or can be included as part of other ongoing operations. Open-source documents are significant in the planning of all operations, especially during the execution

of stability and reconstruction operations and civil support operations. As well as hard data, open-source information can provide valuable background information on the opinions, values, cultural nuances, and other sociopolitical aspects in AOIs. In evaluating open-source documents, collectors and analysts must be careful to determine the origin of the document and the possibilities of inherent biases contained within the document.

CAPTURED DOCUMENT OPERATIONS

I-11. One of the significant characteristics of operations is the proliferation of recordkeeping and communications by digital methods (faxes, e-mails, typed, or computer-generated documents). The rapid and accurate extraction of information from these documents contributes significantly to the commander's accurate visualization of his battlefield. Documents may be captured on or in immediate association with EPWs and detainees, may be found on or turned in by refugees, line crossers, DPs or local civilians, or may be found in abandoned enemy positions or anywhere on the battlefield.

DOCUMENT EVACUATION AND HANDLING

I-12. The rapid evacuation and exploitation of documents is a shared responsibility. It originates with the capturing unit and continues to the complete extraction of pertinent information and the arrival of the document at a permanent repository, normally at the joint level, either within the theater of operations or outside of it. Documents captured in association with detainees and EPWs, with the exception of identity documents, are removed from the individual to ensure that documents of intelligence interest are not destroyed. These documents are evacuated through EPW evacuation channels with, but not on the person of, the detainee. With the exception of official documents, all documents are eventually returned to the detainee.

I-13. CEDs not associated with a detainee are evacuated through MI channels, generally starting with the capturing unit's S2. Depending on the type of documents, they may eventually be evacuated to the National Center for Document Exploitation. HUMINT collectors and translators can extract information of intelligence interest from CEDs at every echelon; they will make an attempt to exploit CEDs within their expertise and technical support constraints. Collectors evacuate CEDs to different elements based upon the information contained and the type of document concerned. For example, documents related to criminal activity may be evacuated to the nearest criminal investigative unit. Direct evacuation to an element outside the chain of command takes place at the lowest practical echelon but is normally done by the first MI unit in the chain of command. Document evacuation procedures are outlined in Annex B (Intelligence) of the unit's OPORD and SOPs.

Actions by the Capturing Unit

I-14. Document accountability begins at the time the document comes into US possession. Original documents must not be marked, altered, or defaced in any way. The capturing unit attaches a DD Form 2745 (Enemy Prisoner of War Capture Tag), Part C, to each document. Only in the case where a

capturing unit does not have the time nor the manpower to mark each document due to ongoing combat operations should the capturing unit fill out one capture tag for a group of documents. In this case, the capturing unit should place the documents in a weatherproof container (box or plastic bag). The capturing unit should fill out two copies of the DD Form 2745, placing one copy inside the container and attaching one to the outside of the container. If these forms are not available, the capturing unit records the required data on any piece of paper. Figure I-1 shows an example of a field expedient tag. At a minimum, the capturing unit should record the information as follows:

- Time the document was captured as a DTG.
- Place document was captured, including an 8-digit coordinate, and description of the location. This should be as detailed as time allows. For example, if a terrorist safe house was searched, documents might be "bagged and tagged" based on what room of the house they were in, what file cabinet, what desk, and so forth.
- Identity of the capturing unit.
- Identity of the source from whom the document was taken, if applicable.
- Summary of the circumstances under which the document was found.

I-15. Document evacuation procedures are listed in Annex B (Intelligence) to the OPORD. If the capturing unit does not contain a supporting HCT, it forwards any CEDs found on the battlefield directly to its S2. The S2 extracts PIR information as practicable, ensures that the documents are properly tagged, and ensures speedy evacuation to the next higher echelon through intelligence channels. Normally, a capturing unit will use any available vehicle, and in particular empty returning supply vehicles, to evacuate documents. Documents captured on or in association with detainees, including EPWs, should be tagged and removed from the detainee. They are evacuated with (but not on) the detainees to an MP escort unit or an EPW holding facility.

I-16. When large numbers of documents are captured in a single location, it is often more expedient for the capturing unit to request a DOCEX team or HCT from the supporting MI unit be sent to the documents rather than attempting to evacuate all the documents. This reduces the burden on the capturing unit, facilitates the rapid extraction of information, and enables the priority evacuation of documents of importance to higher echelons. This method should only be used if the capturing unit can adequately secure the documents until the arrival of the DOCEX team and if the battlefield situation and MI resources permit the dispatch of a team. The capturing unit should include in its request the following:

- The identification of the capturing unit.
- Its location and the location of the documents.

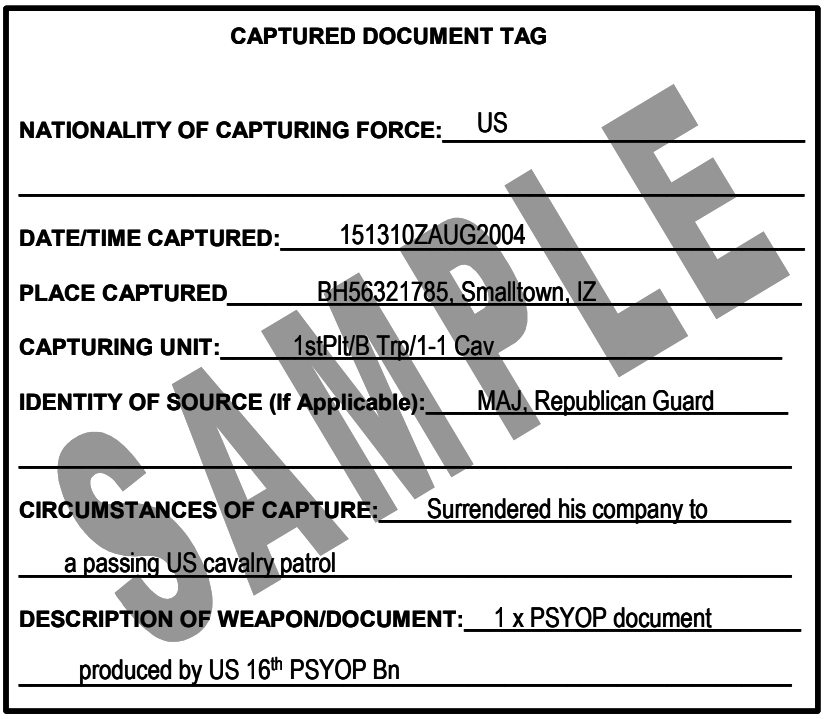

Figure I-1. Example of a Field Expedient Capture Document Tag.

- The general description of the document site (such as an enemy brigade headquarters).
- The approximate number and type of documents.
- The presence of captured computers or similar equipment.

I-17. The MI unit dispatching the team should notify the requesting team as soon as possible to provide them an estimated time of arrival and to coordinate the arrival of the team. There is no set time for how long any particular echelon may keep a document for study. The primary aim of speedy evacuation to the rear for examination by qualified DOCEX elements remains. Each echelon is responsible to prevent recapture, loss, or destruction of the CEDs.

ACTIONS BY THE FIRST HUMINT COLLECTION OR DOCEX UNIT

I-18. The first HUMINT collection or DOCEX unit to receive CEDs should log, categorize, and exploit the documents to the best of its abilities based on METT-TC factors. They should rapidly identify documents requiring special handling or special expertise to exploit and evacuate those documents to the appropriate agencies. The MI unit SOP or OPORD should list special document evacuation requirements and priorities.

Accountability

I-19. The capturing unit and each higher echelon take steps to ensure that they maintain CED accountability during document evacuation. To establish accountability, the responsible element inventories all incoming CEDs. Anyone who captures, evacuates, processes, or handles CEDs must maintain accountability. All CEDs should have completed captured document tags. An incoming batch of documents should include a captured document transmittal. Figure I-2 shows this format. The exact format for a document transmittal is a matter of local SOP, but it should contain the information listed below:

- The identity of the element to which the CEDs are to be evacuated.
- The identity of the unit forwarding the CEDs.
- The identification number of the document transmittal.
- Whether or not CEDs in the package have been screened and the screening category. (If not screened, NA is circled.) Document handlers should package documents that have been screened separately, by category.
- A list of the document serial numbers of the CEDs in the package.

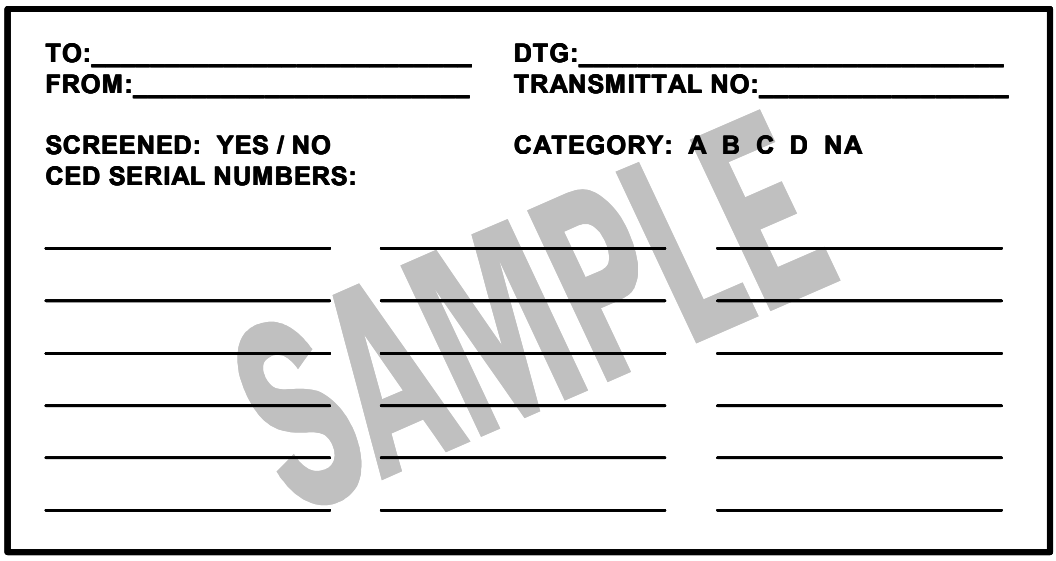

Figure I-2. Example of a Captured Document Transmittal Sheet.

I-20. When a batch is received without a transmittal, the HUMINT collection element contacts the forwarding units and obtains a list of document serial numbers (if possible). The HUMINT collection element records all trace actions in its journal. Accountability includes—

- Inventorying the CEDs as they arrive.
- Initiating necessary trace actions.

- Maintaining the captured document log. (See Figure I-3.)

I-21. When a collector includes intelligence derived from a CED in an intelligence report, he references the identification letters and number of the document concerned to avoid false confirmation.

Inventory

I-22. The receiving element conducts an initial inventory of incoming CEDs by comparing the CED to the captured document tag and accompanying transmittal documents. This comparison identifies—

- Transmittals that list missing CEDs.
- Document tags not attached to CEDs.
- CEDs not attached to document tags.
- CEDs not listed on the accompanying transmittal documents.

UNIT:_____

SAMPLE

Figure I-3. Example of a Captured Document Log.

Trace Actions

I-23. The receiving unit initiates trace actions on all missing CEDs, missing captured document tags, and all information missing from the captured document tags. They initiate trace actions by contacting elements from which the documents were received. The receiving unit can complete this corrective action swiftly if that unit's captured document log was filled out completely. If necessary, the trace action continues to other elements that have handled the document. If a captured document tag is unavailable from elements that have previously handled the CED, the document examiner fills out a

captured document tag for the document using whatever information is available. Attempts to obtain missing CEDs are critical because of the information those CEDs might contain.

Document Logs

I-24. The captured document log is a record of what an element knows about a CED. After trace actions are initiated for any missing documents, the CEDs are entered in the REMARKS section of the captured document log. This log must contain the following:

- Name of capturing unit.
- File number (a sequential number to identify the order of entry).
- DTG the CED was received at this element.
- Document serial number of the captured document tag.
- Identification number of the transmittal document accompanying the CED.
- Complete designation of the unit that forwarded the CED.
- Name and rank of individual that received the CED.
- DTG and place of capture (as listed on the captured document tag).
- Identity of the capturing units (as listed on the captured document tag).
- Document category (after screening).
- Description of the CED. (At a minimum, the description includes the original language; number of pages; type of document such as a map, letter, or photograph; and the enemy's identification number for the CED, if available.)
- Destination and identification number of the outgoing transmittal.
- Remarks to include any other information that can assist the unit in identifying the CED including processing codes. These are set up by local SOPs to denote all actions taken with the document while at the element, including intelligence reports, translations, reproductions, or return of the CED to the source from whom it was taken.

DOCUMENT SCREENING

I-25. Document screening is the rapid but systematic evaluation of documents to determine which documents contain priority information. Selected priority documents will be exploited immediately for PIR information and evacuated expeditiously (often electronically) to a DOCEX facility. Document screening can be done manually (requiring a linguist who is well versed in the current collection requirements) or through the use of scanning devices with key word identification capability. Document processing does not require the complete translation of a document but requires sufficient translation to

determine the significance of the document. A non-linguist may be able to do a degree of preliminary screening based on document format and the location where the document was found.

I-26. As screeners screen each document, they assign one of four category designations. The assigned category determines the document's priority for exploitation and evacuation. Document screening requires that the screening units receive the most current PIR and intelligence requirements; current friendly and enemy situation update; and relevant OB information. Screeners at higher echelons can re-categorize CEDs, to more accurately reflect the requirements at that level or information that has past its LTIOV.

DOCUMENT CATEGORIES

I-27. Documents are divided into categories to prioritize their evacuation and the extraction of information from them for intelligence purposes. Document categories are discussed below.

Category A

I-28. Category A documents are those that require priority evacuation and/or special handling because of their special intelligence value. They contain SALUTE reportable information. Category A documents also include those that are of interest to another command, collecting agency, or other agency (for example, TECHINT, Air Force, Navy, PSYOP, Cryptography).

I-29. What determines if a document is a Category A document changes according to the operational environment and will be set forth in each DOCEX element's SOP and in Annex B (Intelligence) of the unit's OPORD. Documents that are evidence in legal proceedings against captured personnel suspected of crimes against humanity and war crimes will be handled as Category A documents. All Category A documents are handled as SECRET. Standard Category A documents include but are not limited to—

- Unmarked maps.
- Maps and charts containing any operational graphics, which are sent to the G2/S2. From G2/S2, they would be evacuated to the all-source analysis center.
- Air Force related documents, which should go to the nearest Air Force headquarters.
- Navy related documents, which should be sent to the nearest Navy headquarters.
- TECHINT-related documents, which are evacuated to the nearest TECHINT unit.
- Cryptographic and communications-related documents, which are evacuated to the nearest SIGINT analysis unit.
- Documents constituting evidence to be used in legal proceedings against persons suspected of crimes against humanity and war crimes,

which will be marked "CRIMINAL EVIDENCE." Such documents will be kept separate from other documents and will be stored under guard or in a secure area until turned over to a war crimes investigative unit. SJA should be consulted concerning chain of custody requirements.

Category B

I-30. Category B documents contain information of intelligence interest to the supported command. The lowest echelon possible exploits the documents and evacuates them through intelligence channels. Category B documents are handled as SECRET.

Category C

I-31. Category C documents and items contain no information of intelligence interest but still require special administrative accountability (for example, currency, works of art, narcotics). Currency is accounted for on DA Form 4137 (Evidence/Property Custody Document).

Category D

I-32. Category D documents contain no information of intelligence value. Only the theater or higher document repository can categorize documents as Category D.

GROUP DOCUMENTS

I-33. CEDs are first grouped according to their assigned screening category. Personnel must be careful when sorting CEDs to ensure no CED is separated from its associated documents. These large groupings can be broken down into smaller groups. Each of these smaller groupings consists of CEDs that were—

- Captured by the same unit.
- Captured in the same place.
- Captured on the same day at the same time.
- Received at the DOCEX element at the same time.

TRANSMITTAL OF CEDS FROM FIRST AND SUBSEQUENT MI UNITS

I-34. Unless they have an HCT in DS, most units that capture or find documents normally have no way of evaluating, categorizing, or otherwise differentiating documents. They are all tagged and evacuated together by the most expedient means through MI channels. Once these documents arrive at a HUMINT collection or DOCEX unit, the unit can screen, categorize, and extract information from the documents. The degree that documents are exploited at each echelon is dependent on mission priorities and available resources. Document handlers must note any attempts to exploit CEDs on the transmittal documents to prevent unnecessary duplication of effort by higher echelons.

I-35. When transportation assets are limited, CEDs are evacuated according to priority based on document categorization. All Category A CEDs will be evacuated first, followed in order by Categories B, C, and D. Documents that have not yet been screened will be evacuated as Category C documents, but the transmittal slip will clearly indicate that the documents have not been screened.

I-36. Documents will be evacuated in accordance with unit SOP and Annex B (Intelligence) in the unit OPORD. Lower priority CEDs, no matter how old, are never evacuated ahead of those with higher priority. CEDs are packaged so that a package of documents contains CEDs of only one category. If the CED cannot be screened because of time or language constraints, it should be treated as a Category C, but kept separate from screened Category C CEDs.

I-37. When CEDs are evacuated from any echelon, a document transmittal sheet is used (Figure I-2). A separate transmittal document is prepared for each group of CEDs to be evacuated. The sending unit prepares a separate transmittal document for each separate addressee. The transmittal identification number is recorded in the captured document log (Figure I-3) as part of the entry for each captured document. Copies of all translations should accompany the documents to avoid duplication of effort. If the sending unit submitted intelligence reports electronically, it should note the report number or include a copy of the report with the document to avoid duplicate reporting.

I-38. All CEDs being evacuated must be accompanied with the appropriate—

- Technical document (TECHDOC) cover sheet.
- SECRET cover sheet on Categories A and B documents.
- Translation reports and hardcopy reports accompanying translated documents.
- Captured document tags.

JOINT DOCUMENT EXPLOITATION FACILITY

I-39. The Theater MI brigade or group is normally tasked with the establishment of the theater JDEF. The JDEF is staffed by Army linguists, supported by technical experts from the Army and from the other services, and supplemented as required by military and civilian contract translators. The JDEF will normally contain MI experts from SIGINT, CI, TECHINT, and other areas as required to identify and exploit documents of interest to these specialties.

I-40. Military and civilian translators must have security clearances appropriate to their mission requirements. This normally equates to at least a Secret clearance since the translators must be made aware of US collection requirements to facilitate their work. The JDEF performs a final examination of all documents of possible theater intelligence value before storing or evacuating them. The DIA sets procedures for exploitation of documents above theater Army level.

DOCUMENT PROCESSING (RECOVERY AND TRANSLATION)

I-41. Units must normally process documents prior to exploiting them. Document processing includes the translation of foreign language documents into English, the recovery of damaged documents, the decryption of encrypted documents, and the extraction of documents from electronic media such as the extraction or downloading of files from a computer disc or hard drive. This need for processing frequently limits the amount of DOCEX that can be done outside a DOCEX facility.

DOCUMENT RECOVERY

I-42. At a minimum, the JDEF manning includes teams trained in extracting and downloading information from electronic media such as computer hard drives. These individuals work in conjunction with TECHINT personnel responsible for the evaluation of captured computer hardware and software. These teams are prepared to deploy forward as necessary to accomplish their mission.

DOCUMENT TRANSLATION

I-43. Translations are not intelligence information reports. They are, however, often a precondition for DOCEX. Once translated, intelligence information can be extracted and reported on an IIR, SALUTE, or similar report. A translation should accompany the original foreign language document; a copy of the translation should accompany any copies of the original foreign language document and, as required, the intelligence reports. A translation report should contain the following information:

- Where the report will be sent.
- Which element prepared the report.
- DTG of the document translation.
- Report number as designated by local SOPs.
- Document number taken from the captured document tag.
- Document description including type of document, number of pages, physical construction of document, and enemy identification number, if applicable.
- Original captured document language.
- DTG document was received at element preparing the report.
- DTG document was captured.
- Place document was captured.
- Identity of capturing unit.
- Circumstances under which document was captured.
- Name of translator.

- Type of translation: full, extract, or summary.
- Remarks for clarification or explanation, including the identification of the portions of the document translated in an extract translation.
- Classification and downgrading instructions in accordance with AR 380-5.

TYPES OF TRANSLATION

I-44. There are three types of translations:

- Full—one in which the entire document is translated. This is both time and manpower intensive, especially for lengthy or highly technical documents. Normally only a DOCEX facility at theater or national level will do full translations, and then only when the value of the information, technical complexity, or political sensitivity of the document requires a full translation. Even when dealing with Category A documents, it may not be necessary to translate the entire document to gain the relevant information it contains.
- Extract—one in which only a portion of the document is translated. For instance, a TECHINT analyst may decide that only a few paragraphs in the middle of a 600-page helicopter maintenance manual merit translation, and that a full translation is not necessary. The analyst would request only what he needed.
- Summary—one in which a translator begins by reading the entire document. He then summarizes the main points of information instead of rendering a full or extract translation. A summary translation is normally written, but may be presented orally, particularly at the tactical level. Summary translations may be done as part of the document screening process. A summary translation requires a translator have more analytical abilities. The translator must balance the need for complete exploitation of the document against time available in combat operations. Translators working in languages of which they have a limited working knowledge may also use a summary translation. For instance, a Russian linguist may not be able to accurately deliver a full translation of a Bulgarian language document. However, he can probably render a usable summary of its content.

TRANSLATOR SUPPORT TO DOCEX

I-45. When HUMINT collectors are not available due to shortages or other mission requirements, DOCEX can be performed by military or civilian linguists under the management of a cadre of HUMINT collectors.

SECURITY REQUIREMENTS

I-46. Document translators will usually need to have a clearance in order to conduct document translation. An exception is that open-source document translation does not require a security clearance unless the information collected from the open-source documents is linked to specific US collection

requirements, plans, or operations. In this case the translator will need a clearance appropriate to the level of the particular contingency plan or operation to which the information is linked. Individuals without a security clearance should not be used in the exploitation of a closed source or CEDs. By their very nature, the translation of these documents gives keys into the level of US knowledge and the direction of US planning and intentions that precludes their translation by individuals without a security clearance.

SOURCES OF TRANSLATORS

I-47. There are various sources that a commander can use to obtain the linguists necessary to support DOCEX operations.

- RC and AC MI linguists. Dependent on their mission requirements, any MI soldiers with the required language qualification may be used as document translators. The advantage of using MI soldiers is that they have the appropriate security clearance and have a firm grasp of collection requirements. The DOCEX operation will usually require MI officers to manage the administrative portions.
- Other linguists. Non-MI Army linguists include numerous soldiers who have proficiency in a foreign language, regardless of MOS. US civilians can be contracted to provide translator support as can local nationals. Local national hires will provide the bulk of the translator support.

REQUIREMENTS FOR A DOCEX OPERATION

I-48. The number of personnel required to conduct DOCEX varies with the echelon and with the volume of documents. Regardless of the size of the operation, certain basic functions must occur:

- Supervision and Administration. These are the C2 and logistical aspects of the DOCEX operation that ensure that operations are smooth and uninterrupted.
- Accountability. Accountability includes logging documents in and out, copying documents as required, storing documents, receiving and transmitting documents, maintaining files, and other routine activities. This ranges from a parttime task for one individual at a low echelon, to warehouse-sized operations involving tons of documents at an EAC document repository.
- Screening. Screening involves the review and categorization of all documents, the prioritization for translation and exploitation, and the identification of documents for special handling and immediate transmittal to specialized units for exploitation. Screening requires senior, experienced individuals well versed in the target language and the collection requirements, capable of making rapid decisions based on minimal information. The number of screeners required depends on the document flow that may range from only a few per day at a low echelon, to literally thousands of documents a day at a theater-level activity.

- Security Requirements. Security requirements include ensuring that the personnel dealing with the documents have the appropriate security level and that they do not pose a security risk to the US. This is particularly important when dealing with non-US translators. Security also evolves ensuring that the documents are marked in accordance with regulation and that proper security measures are in place to prevent compromise of information. At higher echelons, dealing with large numbers of non-US translators normally requires a designated CI team conducting recurring personnel security evaluations.
- Translation. This function involves the directed translation of documents from the target language to English. It requires personnel with the appropriate clearance level who have a working idiomatic knowledge of the target language and English. Higher echelon activities, such as the EAC document repository, group their translation efforts by subject area. For example, one person or group could translate all medical-related documents. At lower echelons, the translators require a more general knowledge. At lower echelons, the same person may translate a document, extract the pertinent information, and report that information. At higher echelons, these are often separate functions.
- Exploitation and Reporting. This task is the identification and extraction of information in response to collection requirements and requires a high level of expertise. The individual must be totally knowledgeable of collection requirements and must be able to readily identify indicators of activity or identify the significance of minute pieces of information that could contribute to answering requirements. Reporting involves placing that extracted information into a coherent, properly formatted report so that the all-source analyst can add it to the intelligence picture.
- Quality Control. This aspect includes ensuring that all aspects of the DOCEX operation—including accounting for, screening, translating, exploiting, and reporting—are functioning correctly.

REPORTING

I-49. Information collected from documents is normally reported in a SALUTE report or an IIR. Reporting through other reporting formats is discouraged. Intelligence reports are normally forwarded electronically or as otherwise directed by SOPs and operational instructions. Normally an electronic or hardcopy file of each report is maintained at the unit of origin; one electronic or hardcopy is submitted through intelligence reporting channels; and one is forwarded with evacuated documents to the next unit to receive the document to prevent redundant reporting. In the event that the document itself cannot be evacuated in a timely manner, a verified copy of a translation report can be forwarded separately from the original document to an exploitation agency.

DOCUMENT EXPLOITATION IN SUPPORT OF HUMINT COLLECTION

I-50. Documents found on detainees, including EPWs—that can be exploited more efficiently when combined with HUMINT collection—are forwarded with the detainee to the next echelon in the EPW/detainee evacuation channel. In exceptional cases, documents may be evacuated ahead of the EPW or other detainee for advance study by intelligence units. A notation should be made on the EPW's capture tag or accompanying administrative papers about the existence of such documents and their location if they become separated from the detainee.

SOURCE-ASSOCIATED DOCUMENTS

I-51. Documents captured on or in association with a human source play an important role in the HUMINT collection process. These documents may contain reportable information the same as with any other CED. The information is immediately extracted from the documents and forwarded in the appropriate intelligence report. In addition to reportable information, documents (in particular personal documents) may provide valuable insight into the attitude and motivation of the source and can be effectively used by the HUMINT collector in the approach process (see Chapter 8). Guidelines for the disposition of the detainee's documents and valuables are set by international agreements and discussed in more detail in AR 190-8 and FM 19-4.

I-52. The capturing unit removes all documents, with the exception of the source's primary identification document, from an EPW or other detainee to prevent their destruction. These are placed in a waterproof container (usually a plastic bag) and Part C of the capture tag is placed in the bag. Documents from each source should be placed in a separate bag. These documents are turned over to the first MP EPW handling unit in the chain of command. The MPs will inventory all documents and prepare a handreceipt and provide a copy to the EPW or detainee.

I-53. To ensure proper handling and expeditious disposition of these documents, the first HUMINT collection element to see the detainee should review the documents as part of the source screening process. If an official document is confiscated and evacuated through MI channels, the HUMINT collector must obtain a receipt for that document from the MPs. If possible, the HUMINT collection unit copies any documents that contain information of intelligence interest and forwards the copies through MI channels. With the exception of an identification document, documents are normally kept separate from the detainee until the detainee arrives at a permanent confinement facility, at which time documents are returned to them per AR 190-8.

I-54. Three possible actions may be taken with documents captured with a source. The documents may be confiscated, impounded, or returned to the source.

Confiscated

I-55. Documents confiscated from a source are taken away with no intention of returning them. Official documents, except identification documents, are confiscated and appropriately evacuated. The intelligence value of the document should be weighed against the document's support in the HUMINT collection of the source. The HUMINT collector must comply with the accounting procedures established for CEDs by the MPs in accordance with AR 190-8.

Impounded

I-56. Some CEDs will contain information that must be exploited at higher echelons. These documents may be impounded by the HUMINT collector and evacuated through intelligence channels. The HUMINT collector must issue a receipt to the source for any personal documents that he impounds. He must comply with the accounting procedures established for CEDs impounded by the MPs in accordance with AR 190-8. When a CED is impounded, it is taken with the intent of eventual return. Personal documents with military information will be impounded if the military value is greater than the sentimental value. An example of a personal document whose military value might outweigh the sentimental value could be a personal photograph that includes military installations or equipment.

I-57. When a CED is impounded, it must be receipted. The receipt will include an itemized list of all the items taken from the prisoner, and the name, rank, and unit of the person issuing the receipt. Items of high value may be impounded for security reasons. For instance, an EPW or detainee apprehended with an unusually large amount of money would have the money impounded and receipted. The MPs will establish and maintain a DA Form 4237-R (Detainee Personnel Record) for impounded items. The register will identity the owner of the impounded items and provide a detailed description of the items impounded. A receipt will be given to anyone who has items impounded. Also, the OIC or authorized representative will complete and sign DA Form 1132-R (Prisoner's Personal Property List – Personal Deposit Fund). A copy will be provided the source. See AR 190-8 for procedures on handling personal effects.

Returned

I-58. Returned CEDs are usually personal in nature. They are taken only to be inspected for information of interest and are given back to the source. Personal documents belonging to a source will be returned to the source after examination in accordance with the GPW. These documents are CEDs whose sentimental value outweighs their military value and may be returned to the source. Copies of these documents may be made and forwarded if deemed necessary. Except for an identification document (which is always returned to the source), documents are evacuated with the source, rather than on the source, until the source reaches a permanent confinement facility at EAC.

Appendix K

Contract Interrogators

INTRODUCTION

K-1. Contractors are used increasingly to augment existing capabilities and bridge gaps in the deployed force structure. With the increased use of contractors comes the need to identify the doctrine and procedures affecting their employment. Leaders and those working with contractors must understand that contractors are civilians authorized to accompany the force in the field and should be provided with an ID card as proof of their authorization. In accordance with GPW Article 4, contractors are to be accorded POW status if captured.

KEY TERMS

K-2. **Contract Interrogator.** A contract interrogator is a contractor who is specifically trained and DOD certified for, tasked with, and engages in the collection of information from individuals (HUMINT sources) for the purpose of answering intelligence information requirements. Their operations must be conducted in accordance with all applicable law and policy. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs. Contract interrogators will operate only in fixed facilities and not in tactical operations. See DOD Instruction 3020.41 for additional information.

K-3. **External Support Contractor.** Contract interrogators fall into the category of External Support Contractor**.** They work under contracts awarded by contracting officers serving under the command and procurement authority of supporting headquarters outside the theater. Their support augments the commander's organic capability.

K-4. **Contracting Officer Representative (COR).** A COR is the contracting officer's designated representative who assists in the technical monitoring and administration of a contract. Typically, a COR is responsible for assisting the contracting officer in contractor-employee day-to-day management of issues that may affect contractor or unit requirements.

K-5. Statement of Work (SOW) or Performance Work Statement:

- Contractor roles and functional requirements, as well as security issues and the relationship to the military chain of command, must be accurately and adequately defined in the SOW. The SOW should include a description of the essential service and require the contractor

to prepare contingency plans to reasonably ensure continuation. Contractors are required to perform all tasks identified within the SOW and all other provisions defined within the contract. The SOW may also stipulate the appointment of a senior contractor at each echelon or facility to be the point of contact for the commander and the COR for resolving contract performance and scheduling challenges.

- The contract must stipulate whether the duty of a senior contractor is an additional duty or the full-time job of the selected contractor. Considering that contractors are "managed" rather than "commanded," having a senior contractor will assist the commander in managing the contract. Without an onsite contractor supervisor, the default chain of command for contract interrogators might otherwise reside in CONUS, at the contractor's headquarters.

CIVILIAN STATUS

K-6. A contract employee cannot be made to engage in any activity inconsistent with his civilian status such as serving as a crew member on a weapon system. Interrogations are presumptively consistent with civilian contractor status, but other tasks should be vetted with the command's legal advisor to ensure they are legally permissible.

COMMAND CONSIDERATIONS

K-7. Theaters in which large-scale operations are conducted are very likely to employ contract interrogators, due to limited numbers of Army HUMINT collectors available. The presence of contractors in the AO adds an additional dimension to the commander's planning process. Force protection is a critical issue. Even in "permissive" environments such as in the case of humanitarian operations, contractors may be placed in danger. The commander must protect his contractors since they have limited capacity to protect themselves.

K-8. The commander has no command authority over contractor personnel. Their relationship with the Government is governed by the terms and conditions of their contract. In short, the commander must "manage" contractor personnel through the contracting process. He has no authority to command or discipline them unless it is a declared war, at which time contractors may fall under the provisions of the UCMJ. This distinction between command and management does not prohibit the commander from directing contractors to carry out essential activities, such as activities related to security and safety, consistent with the terms of their contracts.

K-9. The terms and conditions of any contract must be constructed so as to include provisions requiring contractor personnel to abide by all guidance and obey all instructions and general orders applicable to US Armed Forces and DOD civilians including those issued by the Theater Commander. The contractor can be required to "take reasonable steps" to ensure his personnel comply with the above and to ensure "the good conduct" of his employees. Furthermore, the contractor can be required to promptly resolve, to the satisfaction of the COR, all contractor employee performance and conduct problems identified by the COR. The COR can direct the

contractor, at the contractor's expense (for example, a non-allowable charge to the contract) to remove and replace any contractor employee failing to comply with the above. This provides a significant tool to aid in achieving good order and discipline within an AO. The commander also has the authority to initiate proceedings that could lead to charges under Military Extraterritorial Jurisdiction Act (MEJA) or the War Crimes Act.

K-10. Contractors will be subject to the extraterritorial jurisdiction of the United States and will comply with all applicable law and policy. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs. Contractor misconduct may be subject to prosecution under federal jurisdiction pursuant to the MEJA or the War Crimes Act, or both. Procedures for initiating investigation into such misconduct will normally be established by the operational command.

K-11. The operational command will also establish procedures for referral to federal civilian authorities and necessary pre-trial confinement. Contractors normally will also be subject to the criminal jurisdiction of the HN unless granted immunity from jurisdiction through the provisions of a SOFA or equivalent agreement, or unless the HN waives jurisdiction. As a general rule, contractors are not subject to the UCMJ (with the possible exception for periods of formally declared war).

K-12. The commander should expect contractors to use all means at their disposal to continue to provide essential services, in accordance with the terms and conditions of contracts, until the military releases them. The combatant commander determines when to execute contingency plans for essential services and when to release a contractor.

INTERROGATOR CONTRACT CONSIDERATIONS

K-13. Contracts should be written with the following principles and considerations:

- Contractors will be deployable under all operational scenarios. They will be subject to the same time-phased force deployment data requirements as deploying military units.
- The contractor information system will interface with the Standard Army Management Information System at both retail and wholesale levels. Army units should not have to contend with two separate information systems.
- The contractors will provide interrogation support at fixed facilities as needed. During deployments, the commander (subject to contract terms and conditions) will determine where contractors operate in their AO.
- The contractors will not replace force structure. They will augment Army capabilities and provide an additional option for meeting support requirements.

- Force protection, including the protection of contractors, is the responsibility of commanders.
- The unit must integrate contractor support into the overall support plan. Transportation of contractors on the battlefield must be planned.
- Command and control of contract personnel is dependent upon terms and conditions of the contract. The contracting officer or his designated representative is the appointed liaison for monitoring contractor performance requirements and will ensure that contractors move material and personnel according to the combatant commander's plan. A good technique is for the command to designate and train a unit COR or Contracting Officer's Technical Representative (COTR) at each facility where contract interrogators will be working. Because international and domestic law, including SOFAs, affect the relationship between commanders and contract personnel, commanders and CORs should seek legal advice concerning issues arising during operations.
- The unit must establish a contractor personnel reporting and accountability system. Again, a good technique is for the command to designate and train a unit COR or TCOR at each facility where contract interrogators will be working.
- During deployments, contractors will live and work in field conditions comparable to those for the supported ARFOR. Living arrangements, transportation requirements, food, medical, and other support services will be provided according to the contract. These services may include but are not limited to—
  - Non-routine medical and dental care.
  - Mess.
  - Quarters.
  - Special clothing, equipment, weapons, or training mandated by the applicable commander.
  - Mail.
  - Emergency notification.
- Planning must be accomplished to ensure agreed upon support to contractors is available to the responsible commander.

CONTRACT INTERROGATOR REQUIREMENTS

SELECTION AND EMPLOYMENT CRITERIA

K-14. Contract personnel must meet certain minimum requirements to be qualified to work as contract interrogators. It is the responsibility of the hiring contracting company to ensure that these criteria, set by the Government, are met by the personnel they hire.

K-15. Policy will dictate employment criteria such as minimum education, military service, security clearance, and previous training. Certain civilian experience and training may also meet the policy requirements for contract

interrogator qualifications. Commanders and CORs should refer to the current DA policy on contract interrogators for appropriate guidance.

TRAINING REQUIREMENTS

K-16. All contractor interrogators must successfully complete a training program approved by the United States Army Intelligence Center and Fort Huachuca, or the Defense HUMINT Management Office, which will serve as validation to perform MI interrogations (see DODD 3115.09). The organization Commander or Director initiating the contract must certify that the training has been completed. The training program will ensure that contract interrogators are trained and certified on—

- The most current TTP of interrogation as promulgated by DOD.
- The applicable law and policy related to the treatment of detainees. Applicable law and policy include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs.

K-17. Contract interrogators must also receive training on the supported unit's mission and Interrogation Counter-Resistance Policy pertinent to the AOR they are supporting. This training will be conducted in-theater by the gaining unit.

EQUIPMENT

K-18. Contractors must be issued personal protection gear appropriate for the threat environment. This may include ballistic helmet, personal body armor, NBC protective gear, and in certain circumstances a personal weapon. Contract interrogators must have access to automation equipment to support their mission of intelligence collection and reporting.

UTILIZATION

K-19. Only trained and certified contractors working under the supervision of MI personnel are authorized to conduct interrogations. Contract interrogators may conduct interrogations with an interpreter in the room; however, an OIC or NCO will monitor the interrogation by personal presence or by means of live video camera feed.

K-20. Contract interrogators—

- Will not supervise any military personnel or federal government employees, nor will they be in charge of interrogation facilities.
- Will operate only in fixed facilities. This requirement provides a measure of force protection to the contract interrogator and frees up Army HUMINT collectors for tactical missions.
- Must submit a written interrogation plan to the OIC or NCOIC, and receive approval for the plan, in advance of each interrogation. The plan will specify the information desired and identify what techniques

and approaches for obtaining information will be used to conduct the interrogations.

WORK LOCATIONS

K-21. The commander may position contract interrogators in fixed detention facilities anywhere in the theater, in accordance with the terms and conditions of their contract.

ATTIRE

K-22. Contractors accompanying the force should be visibly distinct from soldiers so as not to jeopardize their status. The JTF or combatant commander may direct contract personnel to wear civilian clothing or a uniform that says "civilian." Specific items of military attire required for safety or security may also be worn, such as chemical defense equipment, cold weather equipment, or mission specific safety equipment.

FIRE ARMS

K-23. A contractor authorized to accompany the force in the field is *not entitled* to be issued a firearm. However, a contract employee may be armed only if **all** of following conditions are met:

- The theater commander grants his approval.
- The employee's corporate policy allows it.
- The employee agrees.

K-24. If all three conditions are met, then the employee must pass proper military side-arm training and will be issued a military specification weapon and ammunition (generally, a 9-millimeter pistol) for *personal protection*. The contractor must also comply with all applicable DOD, service, and local command policies on weapons.

Appendix L

Sample Equipment for HCT Operations

L-1. This materiel and equipment list is provided as a sample of what an HCT may require to support the commander's intelligence requirements. Some of the equipment that is intended to be given to a source should be considered expendable.

L-2. HCT Kit Bag - Assumes four-person configuration for each echelon. Regardless of support relationship (Organic/DS/GS/GSR), HCTs inherently require the following.

L-3. Movement/Survivability/Security:

- Two M998 1-¼ ton vehicle (or non-tactical vehicle as appropriate for mission) per team.
- One crew/squad served weapon per team.
- One M16A2 per team.
- Three M4s per team.
- Four 9mms per team.
- M68 Aim-point System.
- One x body armor with protective plate per team member.

L-4. Collection and Reporting System - Hardware 1 x System per HCT:

- Scaleable collection and reporting tool that changes configuration depending on where it is on the battlefield.
- Should include an individual collection and reporting tool.
- Should include a tool for stand-alone SIPRNET connectivity via satellite or other.

L-5. Collection and Reporting System - Software 1 x per System:

- Simple, intuitive Graphic User Interface (GUI).
- Standardized Reports - SALUTE, IIR, Tactical Interrogation Report, Contact Report, BSD Report. (Policy states that once filled out, the BSD becomes classified; therefore, change policy or make the collection or reporting tool classified as well.)
- Source Management Tool.
- CI Investigations Reports.
- Link Analysis (capable of interface with coalition systems—in this case, Analyst Notebook).
- Mapping - Single, standardized tool (down to 1:12,500 scale maps, operational graphics, GPS interface).

- Biometrics Integration/Biometrics Enrollment Tools (Integrated Automated Fingerprint Identification System [IAFIS]-compliant 10-print fingerprint scanners, iris scanners, photographing station).
- Basic DOCEX application.
- Foreign Language Translation.
- Mission Planning Software.
- Query Tools: basic, advanced, multi-entity, multi-media, save user-defined queries.

L-6. Collection and Reporting System - Peripherals 1 x HCT:

- Digital video/still.
- Printer with print and scanner head (photo quality with ports for flash cards/memory sticks).
- Separate collection kit for biometrics (ink/card packets and/or IAFIS-compliant live scanner, iris scanner). Must be FBI compliant and portable).
- GPS.
- Digital voice recorder (Universal Serial Bus [USB] interface).

L-7. Communications - Requires organic communications systems to higher and laterally (non-line of sight and line of sight):

- Intra-team communications - 1 x individual:
  - Secure or nonsecure (prefer secure).
  - Hands-free and/or handheld.
- Team to all - 1 x HCT:
  - Secure.
  - FM/UHF/Microwave.
  - Line of sight.
  - Non-line of sight.
  - Voice.
  - Digital.
  - Cellular telephone:
    - Voice.
    - Backup for transmitting data.
    - GPS enabled.
  - Friendly force identification and tracking system.
- HCT to Source - 2 sets x HCT:
  - Phone cards.
  - Cell phones.
  - Radios.
  - Email or “Blackberry-like” communications.
  - One-way pager.
  - Clandestine signaling.

L-8. Source Support - 2 sets x HCT:

- Source tracking (blue-force tracker-like capability).
- Digital Voice Recorder (micro, USB interface).
- Digital video or still camera, with telephoto lenses.
- GPS.
- 1 x 1Gb Thumb Drive.

L-9. Data Storage - 1 x HCT:

- 2 x hard drives (one for UNCLASS, one for SECRET).
- 2 x Micro/Thumb, 1Gb drive (one for UNCLASS, one for SECRET).

L-10. Power Generation - 1 x liquid fuel generator or high-capacity (12-hour) (battery - silent, vehicle recharge), power source - 1 x HCT.

L-11. 1 x Universal Power Conversion Kit per HCT and OMT.

L-12. Vision Enhancement:

- 2 x night vision goggles (NVG) per HCT.
- 1 x thermal sensor per HCT.
- 1 x binoculars per individual (4 each).
- 1 x laser range finder per HCT.

This page intentionally left blank.

Appendix M

Restricted Interrogation Technique – Separation

INTRODUCTION

M-1. As part of the Army's efforts to gain actionable intelligence in the war on terrorism, HUMINT collectors may be authorized, in accordance with this appendix, to employ the separation interrogation technique, by exception, to meet unique and critical operational requirements. The purpose of separation is to deny the detainee the opportunity to communicate with other detainees in order to keep him from learning counter-resistance techniques or gathering new information to support a cover story; decreasing the detainee's resistance to interrogation. Separation, further described in paragraphs M-2 and M-28, is the only restricted interrogation technique that may be authorized for use. Separation will only be used during the interrogation of specific unlawful enemy combatants for whom proper approvals have been granted in accordance with this appendix. However, separation may **not** be employed on detainees covered by Geneva Convention Relative to the Treatment of Prisoners of War (GPW), primarily enemy prisoners of war (EPWs). The separation technique will be used only at COCOM-approved locations. Separation may be employed in combination with authorized interrogation approaches—

- On specific unlawful enemy combatants.
- To help overcome resistance and gain actionable intelligence.
- To safeguard US and coalition forces.
- To protect US interests.

GENERAL

M-2. This appendix provides doctrinal guidance for the use of separation as an interrogation technique. Separation involves removing the detainee from other detainees and their environment, while still complying with the basic standards of humane treatment and prohibitions against torture or cruel, inhuman, or degrading treatment or punishment, as defined in the Detainee Treatment Act of 2005 and addressed in GPW Article 3 (Common Article III). Separation is to be distinguished from segregation, which refers to removing a detainee from other detainees and their environment for legitimate purposes unrelated to interrogation, such as when necessary for the movement, health, safety and/or security of the detainee, or the detention facility or its personnel. This appendix—

- Will be reviewed annually and may be amended or updated from time to time to account for changes in doctrine, policy, or law, and to address lessons learned.
- Is not a stand-alone doctrinal product and must be used in conjunction with the main portion of this manual.

M-3. Careful consideration should be given prior to employing separation as an interrogation technique in order to mitigate the risks associated with its use. The use of separation should not be confused with the detainee-handling techniques approved in Appendix D. Specifically, the use of segregation during prisoner handling (Search, Silence, Segregate, Speed, Safeguard, and Tag [5 S's and a T]) should not be confused with the use of separation as a restricted interrogation technique.

M-4. Members of all DOD Components are required to comply with the law of war during all armed conflicts, however such conflicts are characterized, and in all other military operations. Proper application of separation as a restricted interrogation technique in selective cases involving specific unlawful enemy combatants and in accordance with the safeguards outlined in this manual is consistent with the minimum humane standards of treatment required by US law, the law of war; and does not constitute cruel, inhuman, or degrading treatment or punishment as defined in the Detainee Treatment Act of 2005 and addressed in GPW Common Article III.

M-5. Use of separation for interrogation is authorized by exception. Separation will be applied on a case-by-case basis when there is a good basis to believe that the detainee is likely to possess important intelligence and the interrogation approach techniques provided in Chapter 8 are insufficient. Separation should be used as part of a well-orchestrated strategy involving the innovative application of unrestricted approach techniques. Separation requires special approval, judicious execution, special control measures, and rigorous oversight.

M-6. Additionally, the use of separation as a restricted interrogation technique shall be conducted humanely in accordance with applicable law and policy. Applicable law and policy for purposes of this appendix include US law; the law of war; relevant international law; relevant directives including DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, "The Department of Defense Detainee Program"; DOD instructions; and military execute orders including FRAGOs.

M-7. More stringent than normal safeguards must be applied when using the separation technique. Use of separation is subject to USD(I) oversight. Compared to approach techniques, there are two additional steps in the approval process (see Figure M-l) for the use of the separation technique:

- First, the COCOM Commander approves (after SJA review) use of the separation technique in theater.
- Second, following the COCOM Commander's approval, the first General Officer/Flag Officer (GO/FO) in an interrogator's chain of command approves each specific use of separation and the interrogation plan that implements separation (this is non-delegable). Interrogation supervisors shall have their servicing SJA review the interrogation plan before submitting it to the GO/FO for approval.

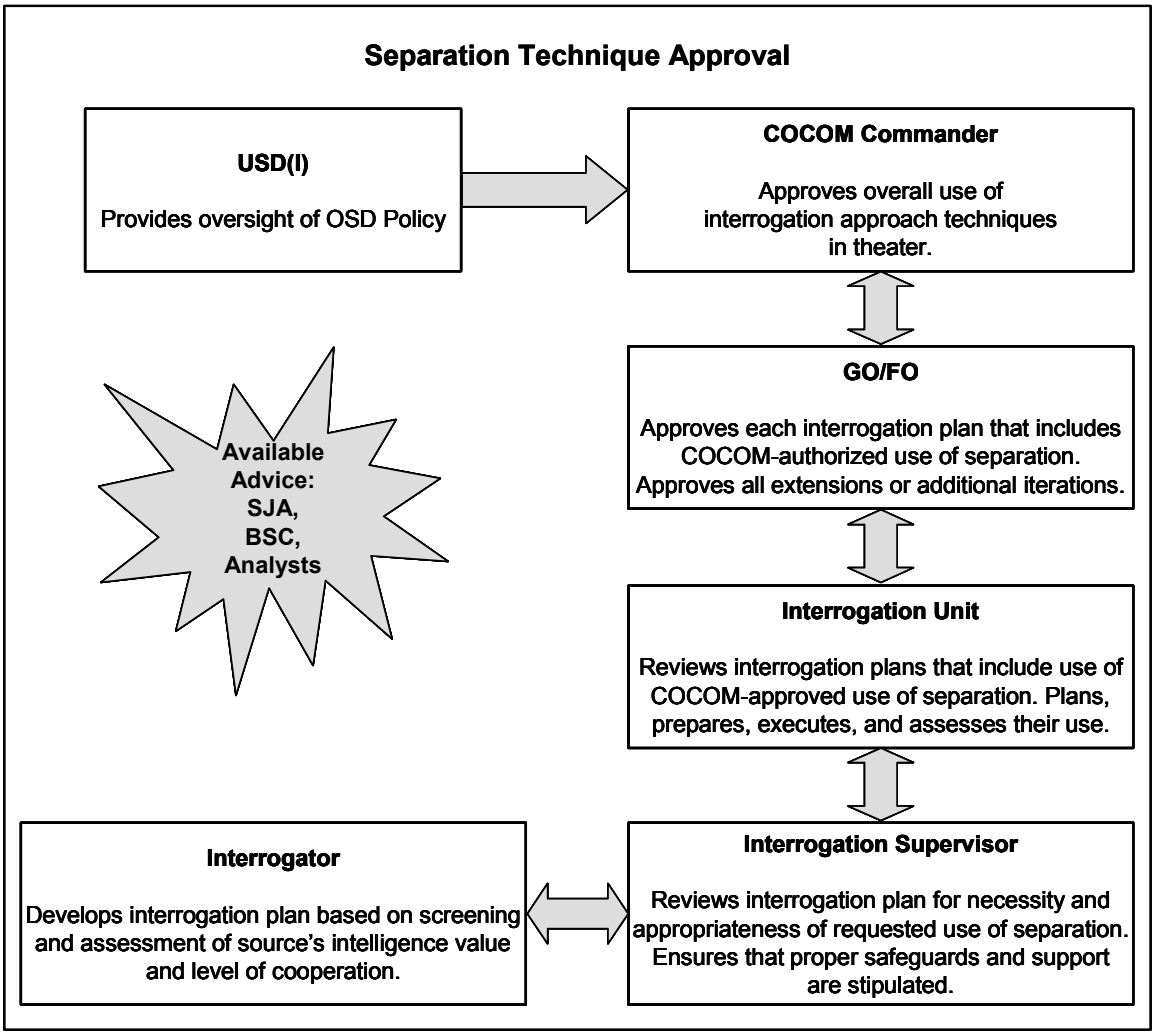

Figure M-1. Separation Approval Process.

M-8. The employment of separation requires notification, acknowledgment, and periodic review, in accordance with USD(I) Memorandum, "(S//NF) Guidance for the Conduct and Oversight of Defense Human Intelligence (HUMINT) (U)," dated 14 December 2004. This means that after the separation is approved for use by COCOMs, the I&WS must be notified as soon as practical. The Office of the Secretary of Defense will review these activities periodically in accordance with DOD Directive 3115.09.

M-9. The planning process for the employment of standard interrogation operations also applies to the employment of the separation technique (see Chapter 4).

RESPONSIBILITIES

M-10. Commanders of interrogation or detention facilities and forces employing the approved separation technique are responsible for compliance with applicable law and policy. Commanders must understand that separation poses a higher risk to the detainee than do standard techniques, and so require strenuous oversight to avoid misapplication and potential abuse.

M-11. The interrogation chain of command must coordinate the interrogation plan with the detention operations commander. Close coordination must occur between intelligence personnel and personnel responsible for detainee operations, including MP, security forces, Master at Arms, and other individuals providing security for detainees (hereafter referred to as guards). Guards do not conduct intelligence interrogations and, in accordance with DOD Directive 3115.09, will not set the conditions for interrogations. Guards may support interrogators as requested for detainee custody, control, escort, and/or additional security (for example, for combative detainees), in accordance with paragraphs 5-57 through 5-66 and FM 3-19.40, JP 3-63, and the approved interrogation plan.

M-12. The detention operations commander (in conjunction with the MI commander) may convene a multidiscipline custody and control oversight team including, but not limited to, MP, MI, BSC (if available), and legal representatives. The team can advise and provide measures to ensure effective custody and control in compliance with applicable law and policy.

M-13. Commanders must consider the following when employing separation:

- Is separation directed against the appropriate individual and is it necessary for collecting important intelligence?
- Does separation complement the overall interrogation strategy and interrogation approach technique or techniques?
- Is the application of separation with the specific detainee at issue consistent with humane treatment and in accordance with applicable law and policy?

M-14. Planning for the use of separation requires coordination with staff elements that provide support to interrogation operations. Staff elements that support interrogation facilities and forces employing separation will comply with paragraphs 4-59 and 4-60 and all controls and safeguards identified in paragraphs M-17 through M-26.

GENERAL CONTROLS AND SAFEGUARDS

HUMANE TREATMENT

M-15. All captured or detained personnel shall be treated humanely at all times and in accordance with DOD Directive 3115.09, "DOD Intelligence Interrogations, Detainee Debriefings, and Tactical Questioning"; DOD Directive 2310.1E, “Department of Defense Detainee Program,” and no person in the custody or under the control of the DOD, regardless of nationality or physical location, shall be subject to cruel, inhuman, or degrading treatment or punishment as defined in US law, including the

Detainee Treatment Act of 2005. All intelligence interrogations, debriefings, or tactical questioning to gain intelligence from captured or detained personnel shall be conducted in accordance with applicable law and policy.

M-16. Any inhumane treatment—including abusive practices, torture, or cruel, inhuman, or degrading treatment or punishment as defined in US law, including the Detainee Treatment Act of 2005—is prohibited and all instances of such treatment will be reported immediately in accordance with paragraph 5-69 thru 5-72. Beyond being impermissible, these unlawful and unauthorized forms of treatment are unproductive because they may yield unreliable results, damage subsequent collection efforts, and result in extremely negative consequences at national and international levels. Review by the servicing SJA is required prior to using separation. Each interrogation plan must include specific safeguards to be followed: limits on duration, interval between applications, and termination criteria. Medical personnel will be available to respond in the event a medical emergency occurs.

FM 2-22.3 REQUIREMENTS

M-17. Separation must be employed in accordance with the standards in this manual. These standards include the following:

- Prohibitions against abusive and unlawful actions (see para 5-75) and against the employment of military working dogs in the conduct of interrogation (see paras 5-59 and 8-2).
- Requirement for non-DOD agencies to observe the same standards for the conduct of interrogation operations and treatment of detainees when in DOD facilities (see para 5-55).
- Prohibition on guards conducting intelligence interrogations or taking any actions to set the conditions for interrogations. Humane treatment, evacuation, custody and control (reception, processing, administration, internment, and safety) of detainees; force protection; and the operation of the internment facility are discussed in paragraphs 5-57 through 5-66. (FM 3-19 .40 and JP 3-63 also thoroughly discuss detainee operations.)
- Assignment of ISNs to all detainees in DOD control, whether or not interrogation has commenced, as soon as possible; normally within 14 days of capture. (See AR 190-8 and Secretary of Defense Memorandum dated 20 September 2005, "(S//NF) Policy on Assigning Detainee Internment Serial Numbers (ISN)(U)."
- Access to detainees by the ICRC.

REPORTING OF ABUSES AND SUSPECTED ABUSES

M-18. As an interrogation technique, separation is particularly sensitive due to the possibility that it could be perceived as an impermissible act. Interrogators applying the separation technique and the chain of command supervising must be acutely sensitive to the application of the technique to ensure that the line between permissible or lawful actions and impermissible or unlawful actions is distinct and maintained. Therefore, HUMINT collectors should have heightened awareness and understanding of the risks,

control measures, and safeguards associated with the use of separation. Any interrogation technique that appears to be cruel, inhuman, or degrading as defined in US law; or impermissibly coercive, or is not listed in this manual, is prohibited and should be reported immediately to the chain of command or other appropriate channels for resolution. Orders given to treat detainees inhumanely are unlawful. Every interrogator must know how to respond to orders that the individual interrogator perceives to be unlawful (see paras 5-80 through 5-82).

M-19. If the order is a lawful order, it should be obeyed. Failure to obey a lawful order is an offense under the UCMJ.

COMMAND POLICY AND OPERATION ORDERS

M-20. The provisions of this appendix must be written into COCOM policy and/or OPORDs when using the restricted interrogation technique of separation.

MEDICAL

M-21. Commanders are responsible to ensure that detainees undergoing separation during interrogation receive adequate health care as described in greater detail in paragraph 5-91.

TRAINING AND CERTIFICATION

M-22. Only those DOD interrogators who have been trained and certified by the United States Army Intelligence Center (USAIC), or other Defense HUMINT Management Office (DHMO) designated agency, in accordance with guidance established by USD(I) to use separation, are authorized to employ this technique. The training must meet certification standards established by the Defense HUMINT Manager in coordination with applicable DOD components. Properly trained and certified contract interrogators are authorized to initiate interrogation plans that request the use separation, and, once the plan is approved, to employ the technique in accordance with the provisions of this appendix and Appendix K. Contract interrogators will always be utilized under the supervision and control of US government or military personnel (see para K-19 and K- 20). Non-DOD personnel conducting interrogations in DOD facilities must be certified by their agency and separately gain approval (through their agency's chain of command) for the additional technique described in this appendix. They must present this written certification and agency approval to the COCOM before use is permitted (see para 5-55).

PLANNING

M-23. Planning for the use of separation must include—

- An interrogation plan that addresses safeguards, limits of duration, interval between applications, termination criteria, and presence of qualified medical personnel for emergencies (see Figure M-2).
- A provision for detainees to be checked periodically in accordance with command health care directives, guidance, and SOPs applicable to all detainees.
- A legal review.

SAMPLE

Figure M-2. Installation Plan for Restricted Separation Techniques.

- Documentation of the use of separation, including photographs and/or videotaping, if appropriate and available (see para 5-54).

M-24. Separation is only authorized for use in interrogation operations, not for other Military Source Operations. Separation may be approved for use in combination with authorized approach techniques. General controls and safeguards contained in this manual must be applied during the use separation, in conjunction with the safeguards specific to the separation technique. **Planning must consider the possible cumulative effect of using multiple techniques and take into account the age, sex, and health of detainees, as appropriate.**

TECHNICAL CONTROL

M-25. Requests for approval of separation will be forwarded (for information purposes only) via secure means through intelligence technical channels at the same time as they are sent through command channels. Intelligence technical channels are those used for forwarding of source information and technical parameters of collection operations from lower to higher and passing tasking specifics, source information, technical control measures, and other sensitive information from higher to lower. The technical chain extends from the HCT through the OMT and Operations Section (if one exists) to the C/J/G/S2X.

APPLICATION OF SEPARATION TECHNIQUE

M-26. The purpose of separation is to deny the detainee the opportunity to communicate with other detainees in order to keep him from learning counter-resistance techniques or gathering new information to support a cover story, decreasing the detainee's resistance to interrogation. Separation does not constitute sensory deprivation, which is prohibited. For the purposes of this manual, sensory deprivation is defined as an arranged situation causing significant psychological distress due to a prolonged absence, or significant reduction, of the usual external stimuli and perceptual opportunities. Sensory deprivation may result in extreme anxiety, hallucinations, bizarre thoughts, depression, and anti-social behavior. Detainees will not be subjected to sensory deprivation.

M-27. Physical separation is the best and preferred method of separation. As a last resort, when physical separation of detainees is not feasible, goggles or blindfolds and earmuffs may be utilized as a field expedient method to generate a perception of separation.

M-28. Objectives:

- Physical Separation: Prevent the detainee from communicating with other detainees (which might increase the detainee's resistance to interrogation) and foster a feeling of futility.
- Field Expedient Separation: Prolong the shock of capture. Prevent the detainee from communicating with other detainees (which might increase the detainee's resistance to interrogation) and foster a feeling of futility.

M-29. Safeguards:

- **Duration:** Self-explanatory.
- **Physical Separation:** Limited to 30 days of initial duration.
- **Field Expedient Separation:** Limited to 12 hours of initial duration at the initial interrogation site. This limit on duration does not include the time that goggles or blindfolds and earmuffs are used on detainees for security purposes during transit and evacuation.
- **Oversight Considerations for Field Expedient Separation:**
  - The intended use of field expedient means of separation must be specified on the interrogation plan that is submitted to the GO/FO for approval.
  - Detainees must be protected from self-injury when field expedient means of separation are used. The effect of the application of field expedient separation means on the detainee must be monitored to detect any possible health concerns.

M-30. The following safeguards apply to both Physical Separation and Field Expedient Separation.

- **Break:** Additional periods of separation will not be applied without the approving GO/FO's determination of the length of a break between iterations.
- **Extension:**
  - **Physical Separation Method**: Extensions of this technique past 30 days must be reviewed by the servicing SJA and approved by the original approving GO/FO or his replacement in that position.
  - **Field Expedient Method:** Extensions past 12 hours of initial duration at the initial interrogation site must be reviewed by the servicing SJA and approved by the original approving/replacement GO/FO.
  - **Medical:** Detainees will be checked periodically in accordance with command health care directives, guidance, and SOPs applicable to all detainees.
  - **Custody and Control:** The interrogation chain of command must coordinate the interrogation plan with the Detention Operations Commander. The Detention Operations Commander (in conjunction with the MI commander) may convene a multidiscipline custody and control oversight team including, but not limited to, MP, MI, BSC (if available), and legal representatives. The team can advise and provide measures to ensure effective custody and control in compliance with the requirements of applicable law and policy.
- **Oversight Considerations:**
  - Use of hoods (sacks) over the head, or of duct tape or adhesive tape over the eyes, as a separation method is prohibited.
  - If separation has been approved, and the interrogator subsequently determines that there may be a problem, the interrogator should seek further guidance through the chain of command before applying the technique.

- Care should be taken to protect the detainee from exposure (in accordance with all appropriate standards addressing excessive or inadequate environmental conditions) to—
  - Excessive noise.
  - Excessive dampness.
  - Excessive or inadequate heat, light, or ventilation.
  - Inadequate bedding and blankets.
  - Interrogation activity leadership will periodically monitor the application of this technique.
- Use of separation must not preclude the detainee getting four hours of continuous sleep every 24 hours.
- Oversight should account for moving a detainee from one environment to another (thus a different location) or arrangements to modify the environment within the same location in accordance with the approved interrogation plan.

M-31. Suggested Approach Combinations:

- Futility.
- Incentive.
- Fear Up.

Glossary

The glossary lists acronyms and terms with Army or joint definitions, and other selected terms. Where Army and joint definitions are different, (*Army*) follows the term. Terms for which FM 2-22.3 is the proponent manual (the authority) are marked with an asterisk (*) and followed by the number of the paragraph (¶) or page where they are defined. For other terms, refer to the manual listed. JP 1-02, Dictionary of Military and Associated Terms and FM 1-02 Operational Terms and Graphics are posted on the Joint Electronic Library, which is available online and on CD ROM.

*2X	The *2X Staff conducts mission and RM for all HUMINT and CI entities located within the designated AOIR. It coordinates, deconflicts, and synchronizes all HUMINT and CI activities in the designated AOIR. ("*2X" indicates 2X functions at all levels.)
AC	Active Component
ACCO	Army Central Control Office
ACE	analysis and control element
ACT	Analysis Control Team
ADA	Air Defense Artillery
ADP	automated data processing
ADCON	administrative control
aka	also known as
AMHS	Automated Message Handling System
AMID	allied military intelligence battalion
AO	area of operations
AOI	area of interest
AOIR	area of intelligence responsibility
AOR	area of responsibility

approx	approximately
ARNG	Army Reserve National Guard
ASAS	All-Source Analysis System
ASCC	Army Service Component Command
ASD(C3I)	Assistant Secretary of Defense (Command, Control, Communications, and Intelligence)
ASI	additional skill identifier
assn	assassination
ATD	associated technical document
BAT	Biometric Automated Toolset
BCT	brigade combat team
BDA	battle damage assessment
BOS	Battlefield Operating System
BSC	Behavioral Science Consultant
BSD	basic source data
C2	command and control
CA	civil affairs
CAT	category
CCIR	commander's critical information requirement
CCNY	City College of New York
CDOC	captured document
CDR	commander
CGS	common ground station
CE	captured equipment (STANAG term)
CED	captured enemy document
CEE	captured enemy equipment
CENTCOM	US Central Command
CFSO	Counterintelligence Force Protection Source Operations
CHAMS	CI/HUMINT Automated Management System
CHATS	CI/HUMINT Automated Tool Set
CI	counterintelligence
CIA	Central Intelligence Agency
CICA	Counterintelligence Coordination Authority
CIAC	Counterintelligence Analysis Cell

CID	Criminal Investigation Division
CIFA	Counterintelligence Field Agency
C2X	Coalition Intelligence Staff Officer
C/J2X LNO	Coalition/Joint Intelligence Staff Liaison Officer
C/J/G2X	Coalition/Joint/Corps/Division Intelligence Staff Officer
C/J/G/S2	Coalition/Joint/Corps/Division/Brigade and Below Intelligence Staff Officer
C/J/G/S2X	Coalition/Joint/Corps/Division/Brigade and Below Intelligence Staff Officer
CMO	civil-military operations
COA	course of action
COCOM	Combatant Command
COE	common operating environment
COLISEUM	Community On-Line Intelligence System for End Users and Managers
COMMZ	communications zone
CONUS	continental United States
CONOP	contingency operations
COP	common operational picture
COR	contracting officer representative
COT	commercial off-the-shelf
COTR	Contracting Officer's Technical Representative
counterintelligence	Information gathered and activities conducted to protect against espionage, other intelligence activities, sabotage, or assassinations conducted by or on behalf of foreign governments or elements thereof, foreign organizations, or foreign persons, or international terrorist activities. (FM 2-0)
Counterintelligence Coordinating Authority	Subordinate to the J/G2X and coordinates all CI activities for a deployed force. It provides technical support to all CI assets and coordinates and deconflicts CI activities in the deployed AO. (FM 2-0)
CP	command post
CPERS	captured personnel (JP-2.5)
CPR	Common Point of Reference
CS	combat support
CSS	combat service support
CTF	coalition task force

DA	Department of the Army
DCGS-A	Distributed Common Ground System-Army
DCIS	Defense Criminal Investigative Service
DCISS	Defense Intelligence Agency CI Information System
DCP	detainee collection point
DEA	Drug Enforcement Agency
debriefing	The systematic questioning of individuals to procure information to answer specific collection requirements by direct and indirect questioning techniques. (FM 2-0)
DED	Data Element Dictionary
DH	Defense HUMINT
DHMO	Defense HUMINT Management Office
DHS	Department of Homeland Security
DIA	Defense Intelligence Agency
DII	DOD Information Infrastructure
DISCOM	Division Support Command
DOCEX	document exploitation
document exploitation	The systematic extraction of information from all media formats in response to collection requirements. (FM 2-0)
DOD	Department of Defense
DOE	Department of Energy
DP	displaced person
DRP	Detainee Reporting
DRS	Detainee Report System
DS	direct support
DSCA	defense support of civilian authorities
DSS	decision support software
DST	decision support template
DTG	date-time group
EAC	echelons above corps
EEFI	essential elements of friendly information
EPW	enemy prisoner of war
evaluating	In intelligence usage, appraisal of an item of information in terms of credibility, reliability, pertinence, and accuracy. (FM 2-0)

EW	electronic warfare
FBI	Federal Bureau of Investigation
FEO	forced entry operations
FFIR	friendly force information requirement
FHA	foreign humanitarian assistance
FISS	Foreign Intelligence Security Service
Five S's	search, seize, segregate, safeguard, and silence
FORSCOM	US Army Forces Command
FRAGO	fragmentary order
FRN	field reporting number
FSE	fire support element
Gb	gigabyte
GC	Geneva Convention Relative to the Protection of Civilian Persons in Time of War
GPS	Global Positioning System
GPW	Geneva Convention Relative to the Treatment of Prisoners of War
GRCS	Guardrail Common Sensor
GRIFN	Guardrail Information Node
GS	general support
GSR	general support-reinforcing
GUI	graphic user interface
GWS	Geneva Convention for the Amelioration of the Condition of the Wounded and Sick in Armed Forces in the Field
HAC	HUMINT analysis cell
HAT	HUMINT analysis team
HCR	HUMINT collection requirement
HCT	HUMINT collection team
HET	human exploitation team
HN	host nation
HOC	HUMINT operations cell
HSOC	Homeland Security Operations Center
HQ	headquarters
HQDA	Headquarters, Department of the Army

human intelligence	The collection by a trained HUMINT collector of foreign information from people and multimedia to identify elements, intentions, composition, strength, dispositions, tactics, equipment, and capabilities. (FM 2-0)
HUMINT	Human Intelligence
HUMINT Analysis Cell	The "fusion point" for all HUMINT reporting and operational analysis in the ACE and JISE. It determines gaps in reporting and coordinates with the requirements manager to cross-cue other intelligence sensor systems.
HUMINT Analysis Team	Sub-element of the G2 ACE that supports the G2 development of IPB products and developing and tailoring requirements to match HUMINT collection capabilities.
HUMINT Operations Cell	Assigned under the J/G2X to track all HUMINT activities in the area of intelligence responsibility (AOIR). It provides technical support to all HUMINT collection operations and deconflicts HUMINT collection operations in the AO. (FM 2-0)
I&WS	Deputy Under Secretary of Defense for Intelligence and Warfighting Support
IAFIS	Integrated Automated Fingerprint Identification System
IBS	Integrated Broadcast Services
ICF	intelligence contingency fund
ICRC	International Committee of the Red Cross
ID	identification
IED	improvised explosive device
IG	Inspector General
IIMG	Interagency Incident Management Group
IIR	intelligence information report
IMINT	imagery intelligence
INTREP	intelligence report
INTSUM	intelligence summary
IPB	intelligence preparation of the battlefield
IPF	Intelligence Processing Facility
IPSP	Intelligence Priorities for Strategic Planning
IR	information requirements
ISA	International Standardization Agreement
ISN	Internment Serial Number
ISR	intelligence, surveillance, and reconnaissance
IU	Interrogation Unit (AJP-2.5)

J2	Joint Intelligence Directorate/Staff
J2X	Joint Intelligence Staff Officer
J2X	Responsible for controlling, coordinating and deconflicting all HUMINT and CI collection activities and keeping the joint force J2 informed on all HUMINT and CI activities conducted in the joint force AOR. (*2X Staff Handbook) Umbrella organization consisting of human intelligence operation cell and the task force counterintelligence coordinating authority. The J2X is responsible for coordination and deconfliction of all human source-related activity. See also counterintelligence; human intelligence. (JP 2-01)
J5	Joint Staff Directorate, Civil Affairs
J/G2	Joint/Corps/Division Intelligence Staff Officer
J/G/S2	Joint/Corps/Division/Brigade and Below Intelligence Staff Officer
J/G/S2X	Joint/Corps/Division/Brigade and Below Intelligence Staff Officer
JAC	Joint Analysis Center
JAO	joint area of operations
JCMEC	Joint Captured Materiel Exploitation Center
JDEF	joint document exploitation facility
JDS	Joint Dissemination System
JFC	Joint Forces Commander
JIC	Joint Interrogation Center
JIDC	Joint Interrogation and Debriefing Center
JISE	Joint Intelligence Support Element
JTF	joint task force
JUMPS	job, unit, mission, PIR and IR, and supporting information
JWICS	Joint Worldwide Intelligence Communications System
KB	knowledgeability brief
LCC	Land Component Command
LDR	Lead Development Report
LEA	law enforcement agency
LNO	Liaison Officer
LRS	long-range surveillance
LTIOV	latest time information is of value
MAGTF	Marine Air-Ground Task Force
MASINT	measurement and signature intelligence
MDMP	Military Decisionmaking Process

MEDEVAC	medical evacuation
MEF	Marine expeditionary force
MEJA	Military Extraterritorial Jurisdiction Act
METT-TC	mission, equipment, terrain and weather, troops and support available, time available, and civil considerations
MI	Military Intelligence
MILO	mission, identification, location, and organization
MSO	military source operations
MOS	military occupation specialty
MP	Military Police
MTOE	modified table of organization and equipment
MTW	major theater war
NA	not applicable
NAC	national agency check
NAI	named area of interest
NATO	North Atlantic Treaty Organization
NBC	nuclear, biological, and chemical
NCO	noncommissioned officer
NCOIC	noncommissioned officer in charge
NGA	National Geospatial-Intelligence Agency
NGO	non-governmental organization
NIP	Notice of Intelligence Potential
NIST	national intelligence support team
NOFORN	no foreign dissemination
NRT	near-real time
NSA	National Security Agency
NVG	night vision goggles
OB	order of battle
OCONUS	outside continental United States
OCR	optical character recognition
OGA	other government agencies
O/I	operations and intelligence
OIC	officer in charge
OMT	operational management team

OPCON	operational control
OPLAN	operations plan
OPORD	operations order
OSC	operations support cell
OSD	Office of the Secretary of Defense
OSINT	open-source intelligence
OPTEMPO	operational tempo
OVOP	overt operational proposal
PDA	Personal Digital Assistant
PIR	priority intelligence requirement
PME	peacetime military engagement
PMO	Provost Marshal Office
POL	petroleum, oils, and lubricants
POW	prisoner of war
PRETECHREP	preliminary technical report
priority intelligence requirements	Those intelligence requirements for which a commander has an anticipated and stated priority in the task of planning and decisionmaking. (JP 1-02)
PSO	peacetime stability operation (STANAG term)
PSYOP	Psychological Operations
PVO	private volunteer organization
PW	Prisoner of War (as used in the GPW)
R	reinforcing
R&S	reconnaissance and surveillance
RC	Reserve Components
RFI	request for information
RM	requirements management
ROE	rules of engagement
RSR	Resource Status Report
SALUTE	Size, Activity, Location, Unit, Time, Equipment
SBI	special background investigation
SCC	Service Component Commands
SCI	sensitive compartmented information
SCO	Sub-Control Office
SDR	Source-Directed Requirement

security detainee	Those detainees who are not combatants, but who may be under investigation or pose a threat to US forces if released.
SE	southeast
SECDEF	Secretary of Defense
SERE	survival, evasion, resistance, and escape
S.F.P.	Students for Peace
SIGINT	signals intelligence
SII	statement of intelligence interest
SIO	senior intelligence officer
SIPRNET	Secret Internet Protocol Router Network
SIR	specific information requirement
SITMAP	situation map
SJA	Staff Judge Advocate
SME	subject matter expert
SOF	Special Operations Forces
SOFA	Status of Forces Agreement
SOI	signal operating instruction
SOP	standing operating procedure
SOW	statement of work
Source (DOD)	1. A person, thing, or activity from which information is obtained. 2. In clandestine activities, a person (agent), normally a foreign national, in the employ of an intelligence activity for intelligence purposes. 3. In interrogation activities, any person who furnishes information, either with or without the knowledge that the information is being used for intelligence purposes. In this context, a controlled source is in the employment or under the control of the intelligence activity and knows that the information is to be used for intelligence purposes. An uncontrolled source is a voluntary contributor of information and may or may not know that the information is to be used for intelligence purposes. See also agent; collection agency. (JP 1-02)
SQL	structured query language
SSC	small-scale contingency
Stability and Reconstruction Operations	Those operations that sustain and exploit security and control over areas, populations, and resources. They employ military capabilities to reconstruct or establish services and support civilian agencies. Stability and reconstruction operations involve both coercive and cooperative actions.
STANAG	Standardization Agreement

TACON	tactical control
tactical questioning	The expedient initial questioning for information of immediate tactical value. Soldiers conduct tactical questioning based on the unit's SOP, ROE, and the order for that mission. Unit leaders must include specific guidance for tactical questioning in the order for appropriate missions. The unit S3 and S2 must also provide specific guidance down to the unit level to help guide tactical questioning. (FM 2-0)
TCICA	Theater Counterintelligence Coordination Authority
TCP	traffic control point
TDA	table of distribution and allowances
TDRC	Theater Detainee Reporting Center
TECHDOC	technical document
TECHNINT	technical intelligence
TES	Tactical Exploitation System
TF	task force
THREATCON	threat condition
TOE	table of organization and equipment
TPFDDL	Time-Phased Forces Deployment Data List
TTP	tactics, techniques, and procedures
TS	Top Secret
tvl	travel
TWS	Trusted Workstation
UCMJ	Uniform Code of Military Justice
UNCLASS	unclassified
unk	unknown
USAR	US Army Reserve
USB	Universal Serial Bus
USCENTCOM	US Central Command
USD(I)	Under Secretary of Defense for Intelligence
UTM	universal transverse mercator (grid)
UW	unconventional warfare
WARNO	warning order
WMD	weapons of mass destruction
WO	warrant officer
WTC	World Trade Center
